This rapid cooler reduces the temperature of the milk in ONE MINUTE to nearly the temperature of the cooling medium. Not only cools the milk but completely aerates it, removing all feed and stable odors.
THIS IS HOW IT WORKS: The C-P Conical Cooler is made of tin or copper in the shape illustrated above. The inside of the drum is filled with ice water or cold running water (a hose can be attached). The milk to be cooled is poured in the bowl and trickles slowly from this over the sides of the drum in a thin sheet. The thin sheet of milk flowing over the cold drum surface is cooled very quickly. The top is removable so that ice may be put directly into the cooling drum.
The Dairy Conical Cooler is automatic in the way it works; is simple in construction and can be as easily cleaned as a common milk pail. Costs so little and works so well that you cannot afford to be without it.
Tin coolers made of the best quality tin with galvanized bottom. Copper coolers are made entirely of copper.
Made in three sizes—the smallest size with a capacity to handle the milk from ten to twenty-five cows—and the work of three milkmen COST ONLY $7.00 in tin. Shipping weight 25 lbs. Prices of copper cooler and larger sizes on application.
Get your order in before we have to advance these prices. Our Dairyman's Catalog on request.

THE CREAMERY PACKAGE MFG. COMPANY,
68 W. Kinzie Street, Chicago, Ill.

Capacity Guaranteed

TELL the dealer you want a wagon that the manufacturer will guarantee to carry your biggest load. If he is up to date, he will show you a **Weber** or **Columbus** wagon with its capacity stenciled in plain figures on the rear bolster. That is the new idea for protecting you in your purchase of a wagon.

When you bought by skein size, you could not be sure that you were buying the most economical wagon. Now you can be sure. Every **Weber** and **Columbus** wagon that leaves the factory is guaranteed by the manufacturer to carry a known load over the roads that you have to travel.

Nor is that all you get when you buy a **Weber** or **Columbus** wagon. The folding end gate and link end rods save you a world of time. The fifth wheel, which only **Weber** and **Columbus** wagons have, makes your wagon run easier and last longer. Write us for complete information about these wagons. You'll be surprised at the number of good features they have.

Reaching the Housewives of America

(Continued from first page.)

sumed by adults has been termed by one person as not "sticking to the ribs" until the next meal; the absorbing power of milk requires in many cases special handling in the home. The argument for using only such products as can be purchased in cans has been the elimination of the care of the bottles, extra bill collector, daily placing of tickets, souring of supply, and worry about the quantity required. These statements apply largely to liquid milk.

Milk has inherited a peculiar place in the American home. In many homes it is purchased to supply a little cream for the cereal and coffee, to have a little "bottom" milk for cooking or some to sour for griddle cakes.

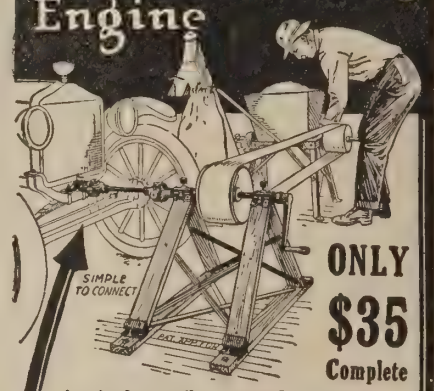
The fact that milk is worth as much as thirty-five cents per quart on some markets when its food value is compared with some other staple foods has not been very convincing argument. Many will say "I'll take the eggs" or "give me the steak". In hay pitching time most of us will agree with these statements. The fact that milk should be a part of the diet rather than *the* diet has not been made clear in all cases.

Teach the Housewife More About Milk

When the housewife knows that milk must be kept in the diet as long as possible to insure the proper development of her child it will be kept in the diet. This fact is substantiated by the way the women of the nation have responded to the calls of the Food Administration. Go into any home and if you are fortunate to be "asked" for a meal you will find in many homes original "dishes" for the conservation of the foods needed for the proper conduct of the war. When our women realized that corn bread meant better rations for the fighters, we had corn bread. When they heard the "boys" needed sweaters, they made them. Many just got one sweater made when the word came that the boys needed sox instead of the sweater and immediately they started to learn to knit sox. When they know the full value of milk as a food there will be a healthy increase in the milk business. The cost will be the last consideration. "Thrift" has made the kitchen rule, "buy nothing that can be dispensed with". The ignorance of many, coupled with the increased price of milk, has made the milk bill one of the first "sectors" of attack.

One Way to Reach More Homes

In millions of homes today pints of milk are being delivered when there should be quarts. With the pint of milk might be included a statement regarding the food value, the vitamines, the disease resisting character, the growth producing power, and many other beneficial characteristics of milk. The material delivered with the milk must be considered in the same light as the newspaper man considers his news. It must not be old, worn-out comparisons, or stale news about milk. The recent discoveries about milk give to every salesman of dairy products a field ripe with material for advertisement. The chief motive of the whole plan must be to get the information into the home in such a way that the women that buy the food will become interested.



Some Advertising is Harmful

Some dairymen have used as advertising matter the hard luck story of their oppression by large concerns. The American public expects to find a cripple when such material is used for selling points of any article on the market. The only successful selling

FILL YOUR OWN SILO

BIG MONEY IN "ORNERY" HORSES

MY free book will amaze you. See the big money that is being made by those I taught my famous system of horse breaking and training! Wild colts and vicious, unmanageable horses can be picked up for a song. By my methods you can quickly transform them into gentle, willing workers and re-sell them at a big profit. You can also earn fat fees breaking colts and training horses for others.

Write! My book is free, postage prepaid. No obligation. A postcard brings it. *Write today.*

Prof. JESSE BEERY, 49 Main St., Pleasant Hill, Ohio

the basis mentioned above is that the peddler of shoe strings or the nd organ man. The publishing of orts of the Food Administration d its attitude toward milk, and the t that five hundred or a thousand nilies are using a product regard- s of cost is, in the mind of the iter, much better advertising.

Knowing the facts about milk and ching them to the housewife and nsient consumer is an effective y to meet the "as good as butter" npaign that has been rampant for ne time. The truth about milk in agricultural press will do its part, per legislation will help, but the cess of the dairy business lies in ching the housewives. When the itude of the housewife has been de favorable, little trouble will be nd in increasing the milk con- nption.

Advocates Oats, Peas, and Barley for Silage

HOARD'S DAIRYMAN:—I note that re has recently been a discussion to the use of oats, peas, and vetch silage, and my experience in St. uis County, Minnesota, may be of erest. I have tried oats, peas, and ch but do not like it as well as oats, as, and barley. This latter mixture an cut with the binder with less or and the material goes through cutter in better shape. In cutting other material with a mower and ing it up there is so much dirt and nes gathered that it is difficult to a good job.

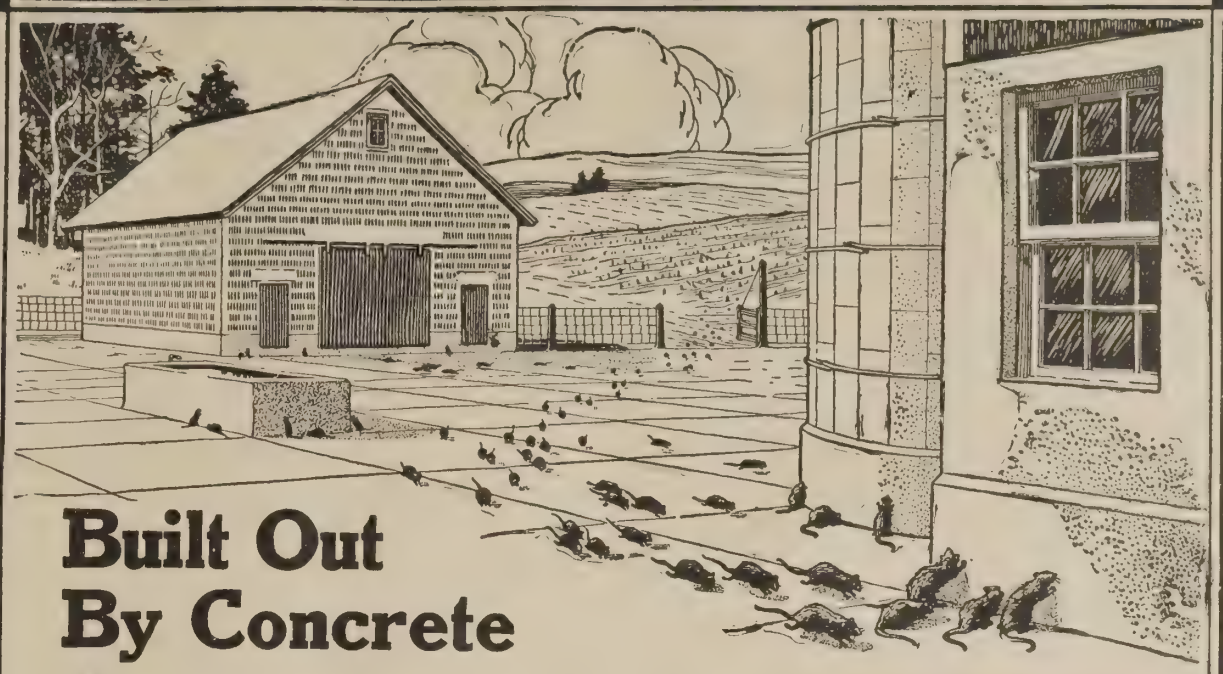
I sow two bushels of Swedish Se- t oats, one-half bushel Canadian d peas, and one-half bushel Oder- icker barley. This is sown on rich, ll prepared land and it makes a d, heavy crop. The barley will en when the oats and peas are just dy for the silo. I do not like to these in too green and prefer to e the oats when they begin to turn little yellow. The cutter should e sharp knives and be set to cut in inch lengths. I run water onto the material and see that it is well ked in the silo. This will make a ge that is not acid and that con- ns a large quantity of grain, mak- what I think is the best silage for northern sections where corn can be relied upon.

I feed this silage to cows and sheep, l have had good results. I find that ch will not yield as well as peas do e. For eighteen years I have tried erent crops for silage but like the s, peas, and barley best of all. rn is all right but I cannot depend n it. However, I would caution r readers to see that the knives kept sharp and are set to cut rt lengths. Every pound will e out in fine shape if it was well mped and a little water added en it was ensiled.

Eveleth, Minn. W. F. H.

The War Mother

A mother's heart! Ah! Who can tell
The pangs of grief it knows?
Or sense the aching void that's left
When forth her soldier goes?



And yet a smile lights up her face,
Tho' tears suffuse her eyes;
Bravely she says the last farewell,
That breaks her dearest ties.

For well she knows her boy goes forth
To fight for truth and right;
That hour of pain and sacrifice,
Freedom shall rise in might.

And so she nobly gives her son,
She prays, by night and day,
That war may cease, but surely end
The ruthless tyrant's sway.

God bless the brave war mother's boy,
And keep him to the end;
Lord God of Hosts! Be with Her, too—
To both the victory send!

Wisconsin. A. S. ALEXANDER.

Built Out By Concrete

No chance to get into these farm buildings!

Concrete foundations, concrete walls, concrete barnyard pavements, concrete feeding floors provide no home for this army of rats seeking winter cover.

No Rat Can Gnaw Through Concrete

There are no nesting places under concrete floors, no chance of entrance through concrete foundations. Waste caused by rats is enormous. If you house them, you must feed them, and this is no time to feed an army of rats. We must feed our soldiers.

Build Out the Rats with Concrete

Write our nearest office for your free copy Bulletins 131 and 141. They will tell you how you can make your farm ratproof.

The Dairyman's Real Problem

How to overcome Loss of Man Power and To Lower Cost of Production—To Keep Things Going at Home

After Our First Year at War, Necessity Has Produced Many Answers to These Problems, at the

National Dairy Show

COLUMBUS, OHIO, OCT. 10th to 19th, Inc.

You Can Learn What Has Been Done for You. There Will be Labor-Saving Devices—Machinery to Take the Place of Man Power—Improved Methods of Operating. The United States Government is Bringing to Your Show, Helpful Ideas and Suggestions.

To Win the War Must be Our One Great Thought, and the Government wants to Co-operate with You to this end

The Show this year will be a real patriotic getting together of the whole Dairy Industry to work out its problems.

You can give and receive help by mingling with your fellows a few days at the Show.

Four Departments of Government are bringing to the Show, the meaning of our Industry to the people of the world.

The Greatest National Exhibit of Milk, Butter and Cheese Ever Assembled.

Creamery Men—Cheese Makers—Ice Cream Manufacturers—Cattle Breeders—Milk Dealers.

Dairy Farmers Will Hold Big Conventions

There is a duty and an opportunity in why you should not miss this Show this year. We must feed the world, and restock Europe with Dairy Cows.

Machinery Exhibits—Infant Welfare Demonstrations—Dairy Products Manufacturing Demonstrations—Home Economics School—Best Bred and Most Practical Cattle in the World.

Horse Show—Cattle Judging—Competitive:—Students' Products Judging—Bull Clubs—Calf Clubs. Cow Testing Associations—Lower Cost Feeds—Practical Farm Herds of Cattle.

Read your paper closely for stories of the valuable events to take place at this year's Show.

GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go. **EDGEWATER STOCK FARM, Fort Atkinson, Wis.**

The Will to Win

HOARD'S DAIRYMAN:—The farmers of this country have done their best in response to the appeal of the government to raise larger crops of wheat and other cereals. Adverse weather conditions have cut down the yields of grain to materially below the quantity expected to be produced, but the total crops are large enough to provide insurance against any food shortage for the allies the coming season.

The products of the American farms this year assure the allied nations of Europe a comfortable margin of safety in their food requirements, whereas a year ago there was the gravest concern over the food situation. That the present situation is as favorable as recently outlined by Herbert C. Hoover, United States Food Administrator, at the London conference with the food commissioners of the allied nations, is due to the industry and patriotism of the American farmer, who has triumphed over big obstacles in the way of labor shortage and adverse weather conditions.

The farmers have made the assurance positive that our boys at the front and in camps in this country are going to be fed and fed right. There is going to be no lack of wholesome food, either for our soldiers and sailors or for those of our allies. To have the fighting forces well fed is indispensable. It is equally vital that the government be supplied promptly with the necessary sinews of war. The government will shortly ask for more billions of dollars with which to carry on the war, and keep the Kaiser's hordes on the move towards the Rhine.

The farmer will now turn in and do his share toward making the Fourth Liberty Loan as big a success as he did in solving the food problem. The boys fighting for us in the trenches are not going to be obliged to worry over the way the folks back home support the government. "The Will To Win" for the farmers as for everybody else will be expressed in buying the Fourth Liberty Bonds to the limit.

Illinois. GEO. A. KING.

Canada has gone us one better on the sugar ration and is down to one and one-half pounds a month.

Mammitis

I have a Jersey cow that is very valuable that has her udder all swelled up on one side and she doesn't eat very much. She was giving a good flow of milk but dried up in just a few days after her udder began to swell. I thought of a snake bite and probably she had bruised it, but there is no indication of either that I can see. Can you give me cause of her udder swelling and will she come back to her milk and will she be of any future use as a dairy cow?

Illinois. J. C.

In some way or another infective matters have gotten into the udder and have caused acute mammitis from which perfect recovery is rare. If the quarters are giving a bad smelling fluid or milk containing pus, you should isolate the cow and fit her for slaughter. Meanwhile strip out the fluid three times a day and once daily inject lukewarm water containing a teaspoonful of boric acid to the pint. Also rub the udder twice daily with camphorated oil.

Mammitis

Kindly advise me treatment for the following trouble: First, lumpy milk, natural color; second symptom, watery, yellow color and thin; third, thick, clotty, and at intervals ropy. This trouble seems to be at any stage of lactation and most of the cows when fresh; the next period milk is O. K. and some will lose a teat or sometimes two.

Manassas, Va. J. B.

The cows are affected with mammitis (garget) which results from many different causes, but chiefly from germ infection in all severe cases. You should at once isolate all affected cows and then cleanse, disinfect, and whitewash the stables. Afterward isolate every cow the moment anything goes wrong with her udder, milk her every two hours, massaging the udder thoroughly each time and two or three times a day bathe the udder with hot water. At night rub in thoroughly a mixture of one part each of turpentine and fluid extracts of belladonna and poke root and five parts of lard, lanolin, sweet oil, or soft soap. At the outset of an attack give a full dose of physic, such as a pound of Epsom salts and half a cupful each of salt and blackstrap molasses in three pints of warm water, as one dose, very slowly and carefully from a long necked bottle. Cleanse the udder and teats of each cow before milking. Milk regularly and strip clean. Protect udders against chilling, bruising, and filth. If the stall floors are constructed of concrete, cover the back portion of each with planking or put in cork brick floors.

One County's Efforts

The Farm Bureau of Allegheny County, Pennsylvania, has worked ut three distinct projects adapted to he peculiar conditions of the county ecause of it being a great industrial enter.

The county has a population of over ne and one-half million people lo- ated on the farms, villages, and cities. 'his fact, together with the great in- ustries of the county producing more han 33 per cent of the ammunition sed by the allies and more than 60 er cent of the ship building materials, vershadows the agriculture of the ounty.

The county is accredited with hav- ng over 5,000 farms, a great percent- ge of which ought to be made more roductive and be supplied with better ve stock.

The members of the Pittsburgh 'ield Club can now sit on their front eranda and view 150 head of sheep razing on their golf links. They were elected from farms in Green County nd placed on the links for the pur- ose of grazing and for increasing the mount of sheep in the county.

Another proposition of interest is he fact that 400 hogs are being fed aily by garbage supplied to them rom the city of Pittsburgh. The gar- age is placed in large tanks and is eated under pressure for eight or en hours, thus making the garbage ree from poison and foreign material, hich precipitates to the bottom of he tanks. In the neighborhood of 150 ushels of garbage are fed daily. At he cost of transporting the garbage nd equipping the farm with the roper facilities for feeding, it is stimated that the pork can be pro- uced in the neighborhood of 10 cents ve weight. Of course they will be nished with corn in the fall.

The third proposition which origin- ted on account of the great amount f farm produce being produced this ear which might otherwise have been asted, is being taken care of by send- ng a truck into the country districts, quipped with a complete canning out- t and six or seven experienced ladies o do the canning of the surplus fruits nd vegetables. The work is being one by the Woman's Committee of he Council of National Defense. The 'arm Bureau aids them in arranging or the schedule and advertising the lan in the rural districts. The outfit s used on a great many farms, and he work will be continued through- ut the season.

N. S. GRUBBS,
County Agriculturist.

Christening the Holstein Calf

HOARD'S DAIRYMAN:—I like to read he advertising in the "Dairyman". 'articularly do I enjoy looking hrough the pages where the breeder's hoicest product is offered for sale. But I must confess that my pleasure s somewhat marred by a consider- tion of the names some of these nembers of bovine aristocracy are equired to bear.

Supposing, Mr. Editor, you were a Holstein bull, mostly white, but in- lined to be morose in disposition and ruculent in manner. Would you be oothed and pacified by being ad- ressed as "Sir Posch Skylark Rag pple"? I know if I were a black and hite cow with hopes of having a undred thousand dollar son and with ride in my ancestry, instead of giv- ng a man uncountable buckets of milk would prefer to administer to him n energetic kick if he should call me Pontiac Segis Piebe Gehunna". Evidently there is an attempt to re- ate the names to the associations of he breed but many of them outrage uphony, disregard history, and asten on an innocent calf a name y which no mother could call him. You wouldn't call even a securely caged Irishman, "Wilhelm O'Brien", would you?

Let met for a moment clear the rep- utation of the herd of all stigma as to its ancestry. I have heard of a man with more zeal than intelligence in his patriotism who sold his Holstein herd because they were of "Dutch" origin, which this misguided soul believed to be the same as German. "Dutchmen" are properly Hollanders and no more German than are the Belgians, and if they are neutrals it is with the same sort of neutrality the innocent bystander feels who stands with hands elevated while the gang of bandits goes through the bank.

Let us give credit to whom it is due. The rich meadows and the patient breeders of the Netherlands are re- sponsible for one of our mainstays of dairying and there can be no harm in recognizing it in the naming of their product. And there is a wealth of suitable names too. "Colantha" is good and "Johanna" is better, but why not also a "Grada", "Jacoba", "Beren- dina", "Theodora", "Dienie", "Jeana", "Maria", "Geezina", or "Aaltje" as well. And instead of "Duchess", never heard of in the Netherlands, why not "Arouw" the equivalent of the Eng- lish "Mrs" or "Juffrow" a title of somewhat added distinction?

And for bulls there is another list fully as appropriate. Instead of "Sir" and "king", which do not flatter a self- respecting Dutch bull, why not "Myn- heer" (Mr.), "Held" (hero), "Konig" and "Meester" (master), as well as the "Hertog" we sometimes see? Then to give variety we might add the names of the Dutch towns or provin- ces. Wouldn't it make a bull feel proud to be known as "Konig van Gelder- land" or "Oueryssel" "Orenthe", or "Friesland"? "Hengerveld" and "De Kol" are good but by no means ex- haust the possibilities. Why can't we have an Oldenbarnveld family or Westerveld or Oosterveld for that matter? There is no limit to the vari- ations along this line. A reference to a map of the Netherlands and a work on general history might greatly enrich the "Who's Who" of the breed. Surely this is a matter that goes beyond mere levity. A sentimental pride in his cattle is one of the dairyman's great- est assets. They are to him not a herd but the individuals of a family. Every one of my cows knows her name and mends her ways when sternly addressed by the same. But it seems most pleasant to sort of make the names fit.

Idaho. J. F. BRUINS.

Obstructed Teat

I have a 30-month-old Jersey heifer, two months fresh, giving 46 lbs. of 5.7% milk per day, that has a growth just inside the opening of right fore teat. Neither teat nor udder is inflamed and apparently there is no pain, even at milking as the cow does not flinch. I have used a milking tube but it does not seem to remedy matters much and there is no veteri- narian within 60 miles.

Center, Wash. H. E.

The milking tube will in time be certain to cause ruinous infection of the quarter. If the growth is high up in the teat, dry off the milk secre- tion. If it is at the tip of the teat, buy a teat bistoury and with it slit down through the obstruction in four different directions; then strip away a little milk every two hours. Steril- ize the instrument by boiling for 20 minutes before use. Apply tincture of iodine to the tip of the teat be- fore operating and once every other day afterward until healed.

Under normal conditions corn is, in nearly all parts of the United States, the cheapest poultry feed. But at times like the present oats are to be preferred. When corn is worth $1.50 a bushel, oats should be $0.75, and barley $1.20 a bushel to give the same value for the money, when fed to poultry, as corn.

DELCO-LIGHT
INCREASES FARM EFFICIENCY

Delco-Light Helps With The Chores

It provides an abundance of bright clear electric light.

It supplies running water to the house and barn.

It furnishes power to operate the washing machine, churn, cream-separator and other light machines.

It pays for itself in time and labor saved.

It betters living conditions—lightens the burden of the housewife and helps keep the boys and girls on the farm.

Delco-Light is a complete electric light and power plant for farm or country home. It is self-cranking, air cooled; ball bearing. Has thick plate, long lived storage battery. No belts.

RUNS ON KEROSENE

There is a Delco-Light man in your locality. Write for his name and for the new Delco-Light book.

The Domestic Engineering Company
Dayton, Ohio, U. S. A.

What counts most

Merely because you already have a certain method of doing a neces- sary chore, you certainly would not object to its being made to yield you a greater profit.

Suppose, therefore, you check up the two costs of cleaning your utensils with the thougnt of how it may be made more profitable.

The first cost is that of time, labor, and cleaning material spent in the Mechanical process of cleaning, and how perfectly this is done decides the extent of the second cost. This second cost represents the differ- ence between the original food value of your product and the food value that remains after improperly cleaned utensils have exacted their regret- table toll of quality.

To enable you to reduce the first cost to a minimum and entirely remove the cause of the second regrettable cost is the purpose of

Wyandotte
Dairyman's
Cleaner and Cleanser

Indian in circle

in every package

And also the secret of its success.

In order then to be positive that your effort to keep things clean is spent more profitably, you have but to order this cleaner from your supply house, and prac- tice its use. It Cleans Clean.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Pabst Stock Farm's Way of Meeting Farm Labor Situation

The Pabst method of utilizing the energy of young America during the summer months is both patriotic and unique. It offers boys of high school age an opportunity to serve their country in the fields at home and also gives them an agricultural training that will be invaluable to them in later years. At the same time they are liberally compensated for their summer's outing. These boys in the pictures are city lads from Milwaukee and are under the direction of Professor Brunner whom Mr. Pabst has procured to accompany the boys to the fields. Professor Brunner has an agricultural education and is, therefore, in a position to impart much agricultural information to the boys while at work. During periods of rest Professor Brunner lectures on various phases of agriculture.

RIGHT ABOUT FACE AND THE BOYS ARE OFF FOR ANOTHER ROW ON THE PABST STOCK FARM

In addition to these advantages Mr. Pabst has further provided for the welfare of these lads on his farm. He has opened the men's club house to them where suitable agricultural literature may be found. Furthermore, he has thrown open his private boat house and bathing beach for the boys to enjoy during the evenings after work. Is not this an ideal place for parents to send their boys during the summer? We prophesy Mr. Pabst's plan will be more generally adopted another year. The boys have still another privilege which cannot be overestimated. They have the opportunity of seeing all phases of farm work done according to the latest and most scientific methods.

Each boy is paid a dollar a month for each year of his age. A boy 17 years old would, therefore, get $17.00 a month plus a bonus which is determined by his willingness and aptitude in picking up farm work.

Wisconsin. J. R. GARVER.

A SNAPSHOT OF THE BOYS AT THE NOON HOUR JUST OUTSIDE THE CLUB HOUSE ON THE PABST STOCK FARM

Knox County Holstein Calf Club

HOARD'S DAIRYMAN JUNIORS:—About one year ago two of the bankers in Edina became interested in the calf club movement which had been worked out in other communities, and proposed to furnish money to boys and girls with good security at 7% interest and return the interest in cash prizes at the end of one year. The calves were to be sold at that time at public auction and the judging to be done before the sale. Fifty-three boys and girls between the ages of eight and sixteen years were enrolled and signed an agreement that was gotten up by a committee composed of a member of each of the banks, an editor from the local paper who contributed the advertising, and the county agent who was made chairman. This agreement contained articles on the age to breed the heifer, kind of bull to breed her to, the care, and the keeping of records, etc.

With all arrangements made the county agent and the editor made a trip to Michigan and selected fifty-three high grade Holstein calves and heifers and one registered bull. On the day for distributing the calves all the club boys and girls were notified and were at a meeting in the court house where North and South side clubs were organized and officers elected. In the afternoon the numbers were drawn and each boy or girl took the calf corresponding to his or her number and took it to its new home. Every one of the fifty-three club members were at the meeting.

On April 26th, 1918, the calf club show and sale were held, just a little over a year after they were taken out. At this time about two-thirds of the heifers were giving milk and many of them had heifer calves at foot. In spite of the bad weather most of the calves were at the show and sale. Two of the calves had died during the year and three had been sold, due to members leaving the county. A few of the heifers could not be brought due to being heavy with calf. The calves brought a total in the sale of $3,117.50 or an average of $97.47 per head for thirty-three head. A large crowd attended the sale and much interest was shown.

A very marked increased interest in dairying is shown which can be traced to the calf club. A number of men have started in the dairy business within the last year whose boy or girl owned one of these heifers. One car load of Holstein cows and heifers was sold in the county, being shipped in by a Wisconsin firm as a result of the calf club. Separator men say that their sales have doubled within the last year and attribute the increase largely to stimulation of the dairy calf club.

Missouri. C. E. CARTER.

TAYLOR SMITH OF MISSOURI WITH HIS HEIFER AND CALF WHICH SOLD FOR $250 AFTER WINNING $58 IN PRIZES

Junior Letters

Hoard's Dairyman Juniors:—I did not get time to write sooner because I was busy helping papa and then two weeks ago I took sick with spotted fever. I am beginning to be able to walk around and go out doors a little. Spotted fever is not contagious so I thought I would write.

When I last wrote you I told you about papa going to give my brother and me a steer calf. My brother got his steer calf, but when the next cow freshened she had a heifer calf so papa gave me a heifer calf too. She is growing fine now. My calf is a cross between a Brown Swiss and a Durham. We have twelve tame rabbits. We have three big ones, one buck, and two does. The buck and doe are the New Zealand Reds. The other doe is a Belgian hare. We have nine young rabbits.

Papa and my brother started to put up our rye hay a few days ago. I am expecting to go out and help them in a few days. My brother went swimming in the Ochoco today. Three weeks ago, when mamma and I were coming home from town, we killed a rattlesnake. It had six rattles and a button. Papa and my brother saw one the same day. We are milking eighteen cows and feeding eleven calves.

Oregon. Victor O. Freund.

Hoard's Dairyman Juniors:—I received your letter of July 17. I was much pleased to hear from you. I am thinking of getting a bicycle. Could you tell me where I could get a cheap one? I like to trap very much. I have been on the trap line over 2 years. When I was 12 years old I began trapping. I first had a 22 calibre rifle, then I thought I would get a shotgun so I bought a 20-guage shotgun last year. I couldn't trap just in the fall because I was sick. I sold 1 muskrat. I got $.50 for it. I sold 4 skunks and 1 muskrat for which I received $5. I am working on trying to get subscriptions. If any of the juniors would like to write me about trapping, my address is N. Scituate, R. I.

We had a calf freshen yesterday. It is an Ayrshire heifer. She is almost thoroughbred. We are going to raise her. I favor the Holsteins very much. My letter is getting long so I will close, wishing the juniors good luck.

Alston Spencer.

Hoard's Dairyman Juniors:—I received your watch fob, button, and creed yesterday and I thank you very much.

The crops look good in North Dakota. We have 4 pigs and 46 sheep and 16 horses and 2 colts. We milk nine cows. Yesterday we took 12 gallons of cream and it came to $25.47.

We are making hay now. We are going to leave the rest of the hay till after harvest. We are not going to get a hired man to shock grain. We children are going to shock. Papa is going to give us 50 cents a day.

North Dakota. Leonard Chance.

Hoard's Dairyman Juniors:—I have been busy putting our wheat up. We are milking 12 cows now. We run 24 cows in the winter. Our cows are Holstein and we have one registered cow and one bull. We have a milking machine. We have five big pigs and twelve little ones. We have four iron gray horses and one bay driving horse. I believe I will close as it is getting bed time. Wishing the juniors good luck.

Pennsylvania. Paul N. Kilgore.

Hoard's Dairyman Juniors:—I received the fob, creed, and button, and thank you very much for them. I got your letter yesterday. I am a farm boy 13 years old and live on a farm of 154 acres. We did milk 6 cows, but 2 of them died. The veterinarian said they were poisoned from eating green apples.

I have a registered Jersey cow, but she is about dry now. We have 5 calves. We sell our cream to a creamery. My father is dead, so my mother and I do all the work.

This year we put out about 30 acres of corn, 8 acres of peas, 10 acres of oats, and put up about 30 acres of hay and about 2 acres of cane. I would like to hear from some of the juniors who have registered stock of their own and would like to know what they feed them and how they care for them. I will write again and send you the picture of my cow and tell you how I got her.

Illinois. Chester Hungate.

Hoard's Dairyman Juniors:—I received my fob, creed and button. I like them very much. I have seven Guinea eggs I am going to set. I have two hens and a rooster.

I live on a 93-acre farm. We have thirteen cows, two calves, four horses, and a pony. Our pony's name is Bonny. We have two barns and a silo. We have a large Scotch Collie named Caesar and a Persian cat named Tiggy. They are about the same color.

I have a war savings stamp. My two sisters and myself have five thrift stamps.

We have 100 little chickens. Will some of the juniors please write to me? My address is Juda, Wis. Wescott Patton.

LEONA THOMPSON OF MISSOURI AND HER HEIFER WHICH SOLD FOR $150

Hoard's Dairyman Juniors:—Hello, juniors! How is everybody? I have not written now for a long time as I have been busy with haying. Hay is quite scarce around here as all the clover froze out. I received a letter from Arthur Brady. In my last letter I said I was going to raise tomatoes, but father gave me a patch of tobacco and so I did not plant any tomatoes. I think our hired man will go to camp soon and so if anybody wants a position write me. My brother is also enclosing a letter in the same envelop as we have to be saving in these war times. My address is Hixton, Wis., R. F. D. No. 1. Leonard Ols.

Hoard's Dairyman Juniors:—I have not been able to find out what caused the death of my rabbits. I had them in a pen built on the side of the wall. The wall had plaster on it. I fed them oats hay, milk once in a while, some water, cabbage leaves, and sometimes a piece of mangel. They were free from dogs and cats and no rats got at them cause they were not chewed. They lived until they were 6 months old, were as healthy as could be, and all of a sudden died after a day's sickness.

We sold all our little pigs because we got enough big ones. During May we had quite a little rain and no rain in June, until the last

few days we had showers up the 4th of July. We had cold weather all spring except a few hot days. The hay and grain and potatoes and also the garden is coming fine since the recent rain. We intend to start haying in a few weeks. We planted about 1,500 cabbage plants this year. The strawberries are not so good this year on account of the cold weather.

Michigan. Ardell Zurcher.

Hoard's Dairyman Juniors:—I guess you think I'm a dandy junior, not writing before this, but I am not a good letter writer.

I live on a 132-acre farm. We have 18 milk cows but half of them are dry. We have four calves tied, and feed them from a bucket, and one which isn't away from the cow. Last summer dad gave me a Holstein bull which he said, if I would help tend to the other stock, he would give to me. I raised him and sold him at a sale here at our place for $76.50. Dad gave one to my sister but it died so he said I should divide with her, so it left me $28.25. He gave me a calf again this year; he gave my sister one, also.

I also have a hen with peeps, 14 in all. One crept through the pen I made for them and a guinea rooster picked it to death, but I still got 13.

We have 2 old sows and each had a litter of pigs. One of them had 6 and the other 7. Out of the litter of 6 one of them was a runt and then dad gave it to me. It is a thoroughbred and also a sow. I am going to try to raise it and then raise young ones. I wish some of the juniors would write to me. My address is R. D. No. 1, Box 132, Lewisburg, Pa.

Clarence Groover.

Hoard's Dairyman Juniors:—I have not written to you since last summer. My calf is growing fine. I have her in pasture with some other calves. I am raising Mallard ducks, but I didn't have good luck this year. I hatched about 25 little ducks but the rats got all but 12. I have 3 White Plymouth Rock pullets and one rooster. I didn't raise any little chicks this year, though. The fair is coming soon and I am going to take some of my ducks.

I am 13 years old and a Freshman in high school. I milk 3 cows night and morning. They give a half a pail of milk apiece. We have two full blooded Holstein calves (twins) and I call them Mike and Pat. I wish some of the juniors would write to me.

Wisconsin. Allan Stanchfield.

Hoard's Dairyman Juniors:—I am sorry that I did not write before. I have 30 hens and 9 little chickens. I only get half of the eggs. I have $15.61 from the eggs. Maybe I am going to buy some pigs. We milked 26 cows. I milk one cow night and morning. My brother and sister and I have to watch the cows so they do not get into the oats field. We got 14 loads of hay for the first crop. My father has 28 acres of corn. I will be in the sixth grade next fall. I am 10 years old. We live 2½ miles north of Monroe, Wis. I wish all the juniors good luck.

Wisconsin. Gilbert Dettvider.

Hoard's Dairyman Juniors:—I have not written to the juniors for a long time so I thought I would write a few lines.

We are milking 11 cows now. We got two horses and seven calves. I milk 3 cows nights and mornings.

We have about 150 laying hens and get about 120 eggs a day.

We have one pig.

We got about 18 acres of land. We have 2¼ acres in berries, 2 acres in barley, 3 acres in oats, and one acre in pole beans and the rest in pasture and hay.

As it is getting bed time I will close, wishing the juniors success.

Washington. Willie Bronsemo.

Hoard's Dairyman Juniors:—I have a colt. The way I got my colt was by joining a calf club.

The goats are doing fine now. Papa is plowing for wheat.

We are getting about a hundred pounds of milk a day. We have six cows. We let the calves have half of the milk that we get from the cows. I help milk nights and mornings.

There is a picnic at Stoutland, Mo.

I like to go to school. Alta Mitchell is our teacher. There are 30 scholars coming to our school.

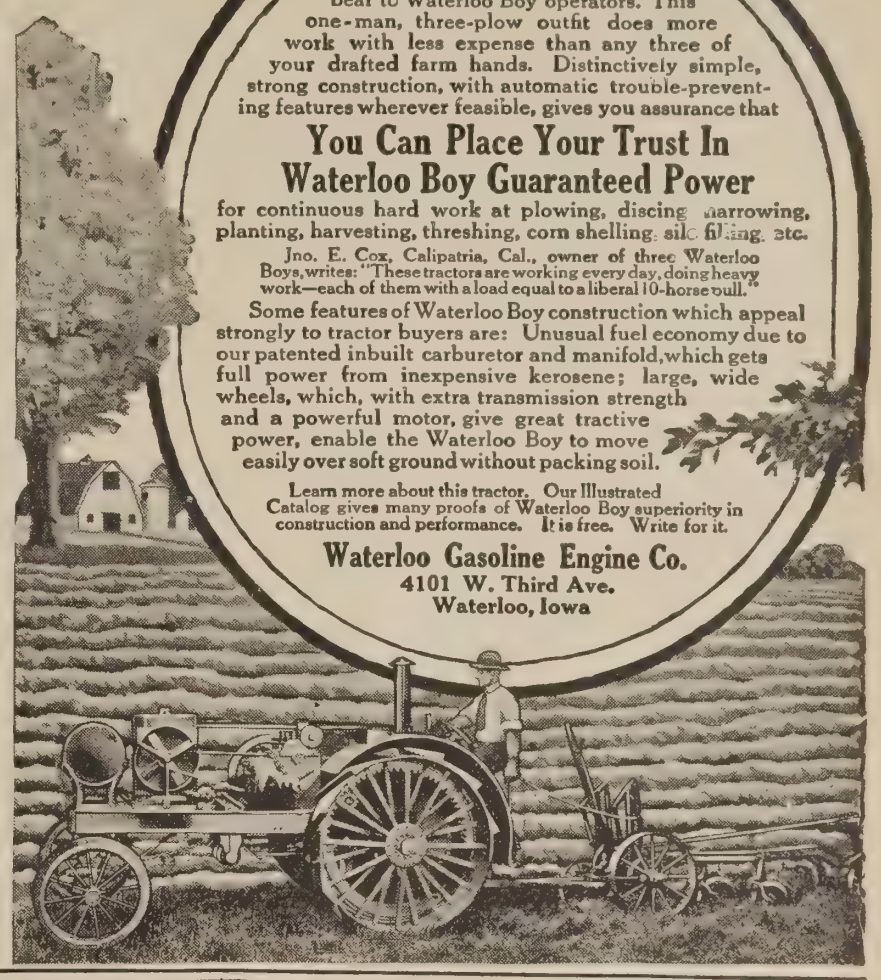
Our apples have been ripe since the first of June. We will have apples until fall. We have seventeen different kinds. They begin to get ripe by the first of June and last until fall.

I will close wishing the juniors good luck.

Missouri. Carl Killhouse.

Hoard's Dairyman Juniors:—I have not written for a long time so I think I will write now to show that I am still a good member of the Hoard's Dairyman juniors.

We have 11 cows, but we are milking only nine. They are the Holsteins. My pig is getting fat. We have him on the alfalfa now. Papa got done plowing yesterday. He plows with the tractor. Our tractor pulls two fourteen-inch plows.



I am 10 years old and will be in the sixth grade this fall. I have to walk about two miles to school every morning. Our school will start in September.

My letter is getting long so I will close for this time, wishing all the juniors good luck.

Kansas. Carl F. Folger.

One Man Does All The Work With WATERLOO BOY

The Original Kerosene Tractor

Farm labor shortage is no bugbear to Waterloo Boy operators. This one-man, three-plow outfit does more work with less expense than any three of your drafted farm hands. Distinctively simple, strong construction, with automatic trouble-preventing features wherever feasible, gives you assurance that

You Can Place Your Trust In Waterloo Boy Guaranteed Power

for continuous hard work at plowing, discing, harrowing, planting, harvesting, threshing, corn shelling, silo filling, etc.

Jno. E. Cox, Calipatria, Cal., owner of three Waterloo Boys, writes: "These tractors are working every day, doing heavy work—each of them with a load equal to a liberal 10-horse bull."

Some features of Waterloo Boy construction which appeal strongly to tractor buyers are: Unusual fuel economy due to our patented inbuilt carburetor and manifold, which gets full power from inexpensive kerosene; large, wide wheels, which, with extra transmission strength and a powerful motor, give great tractive power, enable the Waterloo Boy to move easily over soft ground without packing soil.

Learn more about this tractor. Our Illustrated Catalog gives many proofs of Waterloo Boy superiority in construction and performance. It is free. Write for it.

The Difference is in the Feed

Measure your milk. Then feed your cows on a ration of International Special Dairy Feed. After a while, measure again. Compare the records! The difference is in the feed. One is inefficient. The other is efficient.

Wise dairymen, who believe in efficiency, feed—

International Special Dairy Feed

Gives More Milk Per Cow

It's the 100% dairy feed. It's efficient and economical because it's balanced.

It's palatable, nutritious and easily digested. Cows like it and thrive on it.

International Special Dairy Feed is guaranteed to increase the milk flow of any cow from one to two quarts daily.

Better and Cheaper than Home Grown Grains

You can mix International Special with grains. Use a lot less grain and get an improved ration. The grain you save you can sell. There's more profit for you in the price it brings.

And yet you get more milk than if you fed all grain.

Go to your dealer today and order a supply. Act while the price is low.

INTERNATIONAL SUGAR FEED CO.
Minneapolis, Minn. Mills at Minneapolis and Memphis

Also makers of International Ready Ration—the feed that needs no mixing.

Be Sure It's "International"

The rate for advertising in this department is 8 cents per word. Count address. Remit in advance. Copy must reach us 7 days ahead of date of issue. Farm labor advertising 5c per word.

STOCK FOR SALE

Dispersal auction sale pure-bred registered Holstein cattle, New Douglas, Illinois, September 25th and 26th. Hundred and thirty head, mostly heavy springers. Eight serviceable young bulls from cows with records over thirty pounds of butter in one week. Cattle federally tested and sold subject sixty-day tuberculosis retest. Write for particulars. Willing to go anywhere for good proposition. BOX 208, care Hoard's Dairyman. 6-2

Wanted—Position as manager pure-bred dairy farm. 15 years' practical experience in all branches farming and stock raising, advanced registry, fitting for show ring, sales, etc., also wholesale and retail milk and butter business including pasteurizing and all other details incident to big milk business. Not subject to draft, age 35, married, no children, college education, can make change Sept. 1st. Address BOX 201, care Hoard's Dairyman. 6-3

Position wanted as cook on large farm. Widow with one child. Experienced. MRS. MARY NORRIS, 57 So. Water St., New Haven, Conn.

Middle aged married man, no children, desires position as farm manager, Wisconsin or Eastern Minnesota. Life experience as practical farmer, stock raiser and dairyman. Excellent references. Ready October 1st. BOX 218, care Hoard's Dairyman.

Can you use a man, 46 years of age, college graduate, experienced in feeding and showing cattle? Wire DOUGLAS DEMMON, 52nd and Sansom Sts., Philadelphia, Pa. 7-4

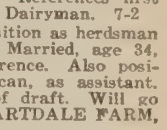
Farm manager, scientific, practical, energetic, capable and reliable, strictly temperate, reliable references, wants position on large modern farm or estate. R. JOHNSON, 4808 Sheridan Road, Chicago, Ill.

Herdsman, single, good on records, seeks position. State particulars. I. KREAMER, Hotel Clark, Cleveland, Ohio.

Wanted—Position as working foreman on stock or dairy farm by young farmer experienced in stock raising, dairying and general farming. Good dry hand milker. Prefer southern or eastern states. State wages in first letter. MacDONALD, Box 76, R. 2, Norfolk, Va.

Position wanted as herdsman, single, 38. 25 years' experience. State wages first letter. WILLIAM MOJE, 547 West Madison St., Chicago, Ill.

Position wanted on up-to-date model dairy and farm by experienced man. References. JOHN GREEN, 1208 West University Avenue, Urbana, Ill.



Wanted—Position as herdsman manager; life experience in dairying, A. R. O., show ring, veterinary; competent as to values, etc.; would consider partnership or share proposition. Present position 5 years. References first class. BOX 224, care Hoard's Dairyman. 7-2

Wanted—November 1st, position as herdsman or manager by Scotchman. Married, age 34, life experience, best of reference. Also position for single man, American, as assistant. 11 years' experience. Out of draft. Will go anywhere. Herdsman, SWIGARTDALE FARM, Petersburg, Mich.

Position wanted as herdsman or farm manager. Graduate of school of agriculture, married, and have experience in A. R. O. work, also certified dairy work. Address BOX 220, care Hoard's Dairyman. 7-2

Wanted—Position as school teacher, or accountant. Box 219, care Hoard's Dairyman.

THE AIREDALE

The Most Useful Dog on Earth

Will do anything any other dog can do, and do it better. As a **Watch Dog,** no dog approaches him. **Will help yard and herd your stock, and bring home your cows better than a Shepherd or Collie. He is an inveterate ratter.** Pedigreed puppies for sale at farmers' prices. Descriptive circular free.

P. H. SPRAGUE, Maywood, Illinois

Why the cost of producing cattle does not determine their selling price

TO produce a steer for meat purposes requires, as you know, a period of from one to three years.

The prices the producer has to pay for feed, labor and other items during this period, together with weather conditions, determine what it costs to produce the steer.

But the price the producer receives for the steer depends on conditions existing at the time it is sent to market.

If the supply of cattle coming on the market at this time is greater than the consumer demand for dressed meat, the prices of meat and live stock go down.

On the other hand, if the number of cattle coming to market is less than enough to supply the consumer demand for meat, the prices of meat and live stock go up.

Not only do the receipts of animals vary from week to week but the consumer demand for meat also fluctuates.

The rise and fall of prices results from an economic law that operates in every business. It is the packer's task to turn live stock into dressed meat and by-products, and distribute them to the consumer under control of this law.

Market conditions and competition establish the prices the producer gets for his cattle. When meat prices go up or down, so do cattle prices.

The packer can't pay out more money for animals than he takes in from the sale of meat and by-products.

Swift & Company will gladly co-operate in the carrying out of any national policy that will tend to steady the prices of live stock and meat.

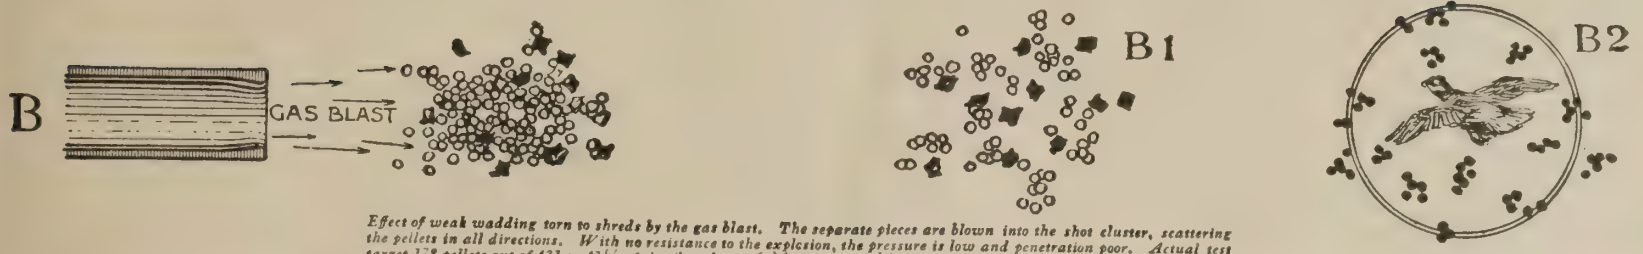
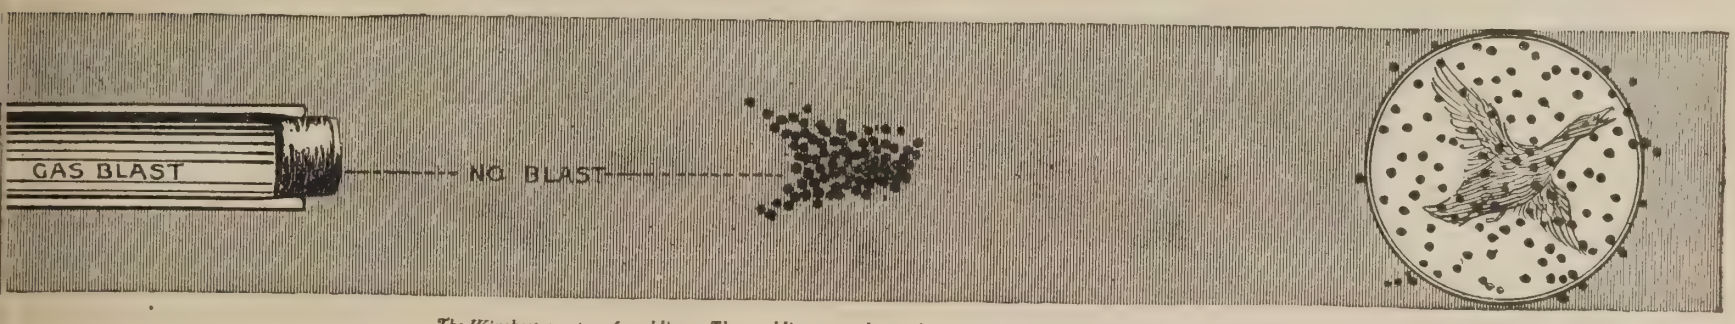
National Dairy Show

In addition to the wonderful exhibit of machinery used by the dairy industry, which will occupy four o the immense buildings on the stat fair grounds and the coliseum a Columbus; shows and parades an the judging rings of cattle an horses; the students' judging con tests of cattle and dairy products; th mammoth exhibit of dairy product under refrigeration; and the activ farm machinery and tractor exhibits there will be this year many feature of world interest replete with sug gestions for war work. As 1918 i children's year in America, one of th outstanding features of interest to b presented is the work for infant wel fare that is being performed unde the guidance of the Infant Welfar Bureau of the U. S. Department o Labor. Miss Julia Lathrop is th chief of this bureau and Drs. Grac Meigs and Dorothy Reed Mendenha are in charge of the work for babie and children. These women have en tered into the spirit of using the sho to visualize to the dairy industry a well as to the mothers and the whol people of America who must b brought to the show or the sho carried to them, the real vital plac that milk occupies, and the necessit of it for the continuance and prope maintenance of the human family Babies and children of tender year will be there to give evidence of th need of milk for full nutrition and t demonstrate the necessary care an feeding of babies for health. Thi will be a glimpse of the gloriou work the women of America are s ably advancing this year to save th babies.



The Dairy Division and States Re lations Service of the U. S. Depart ment of Agriculture are to occupy big place in the show. First, the me in the Dairy Division who have ha in charge the many things for dairy ing that this division gives to th world from time to time will under take to present a concrete picture o the vast and ramifying interests tha come under their care, embracing th work of calf clubs, bull clubs, co testing associations, cheese manu facture, milk and dairy products re search, and the all and several line of dairy farm activities that they ar directing. The States Relation Service will give an elaborate ex position of the whole scheme o Home Economic Work that is be ing advanced by 2,500 women lead ers now preaching the gospel o food all over this country. Most o these leaders will be in attendanc upon the show, and the U. S. Foo Administration will present a mes sage of infinite importance for pro ducer and consumer. These education al and highly interesting events wi all be under immediate care of Dea Van Norman, whose services hav been loaned to the Government an the Dairy Industry by the Universit of California.

Three large buildings 100x200 f will house these educational feature and glass rooms for the Babe and In fant Demonstrations will be erecte therein and the lecture rooms par titioned off and demonstratio kitchens erected in various units t suit the work to be shown. The bes talent obtainable will be in charge an lecturers of national and internation al reputation will make of this th most perfect dairy or food show eve held—filled with interest from th hour of opening until the hour of clos ing.—J. A. WALKER, Chairman Exec utive Committee, National Dairy As sociation.



As to food the Allies have no reaso to fear the future, while the enem dare not look into the coming winte without a shudder.

Effect of hard wadding that fits the barrel loosely. Unchecked by friction or muzzle choke, it is blown through the shot cluster, scattering the shot charge. Actual test target, 221 pellets out of 431 or 51% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-in. circle at 40 yds

Effect of weak wadding torn to shreds by the gas blast. The separate pieces are blown into the shot cluster, scattering the pellets in all directions. With no resistance to the explosion, the pressure is low and penetration poor. Actual test target 178 pellets out of 431 or 41% of the shot charge (1¼ oz. of No. 7½ chilled) inside a 30-in. circle at 40 yds

The Winchester system of wadding. The wadding expands evenly, sealing in the gas blast all the way to the muzzle, where it is checked by the "choke" or constriction. Shot cluster travels on ahead unbroken. Actual test target, 320 pellets out of 431, or 74% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-in. circle at 40 yds

Effect of wadding construction on shot patterns

Poor wadding responsible for more faulty patterns and lost birds than all other gun and shell troubles combined

A strong uniform shot pattern depends upon how perfectly the *wadding* in your shells controls the five-ton gas blast behind it.

The wadding, like the piston head of a gas engine, must give the explosion something solid to work against so that the shot may be *pushed* out evenly.

It must expand and fill the tube of the barrel, completely sealing in the gas behind it. No gas must escape to scatter the shot.

It must offer just the right amount of resistance so as to develop uniform pressure and high velocity without danger of jamming the pellets out of shape at the "choke" or muzzle constriction.

The illustrations at the top of this page show actual test patterns, 50% to 70% faulty, the result of poor wadding.

The Winchester system

Winchester wadding is the result of repeated experiments to determine the most efficient control of the gas blast.

The special construction of the *Base wad* gives what is known as *Progressive Combustion* to the powder charge.

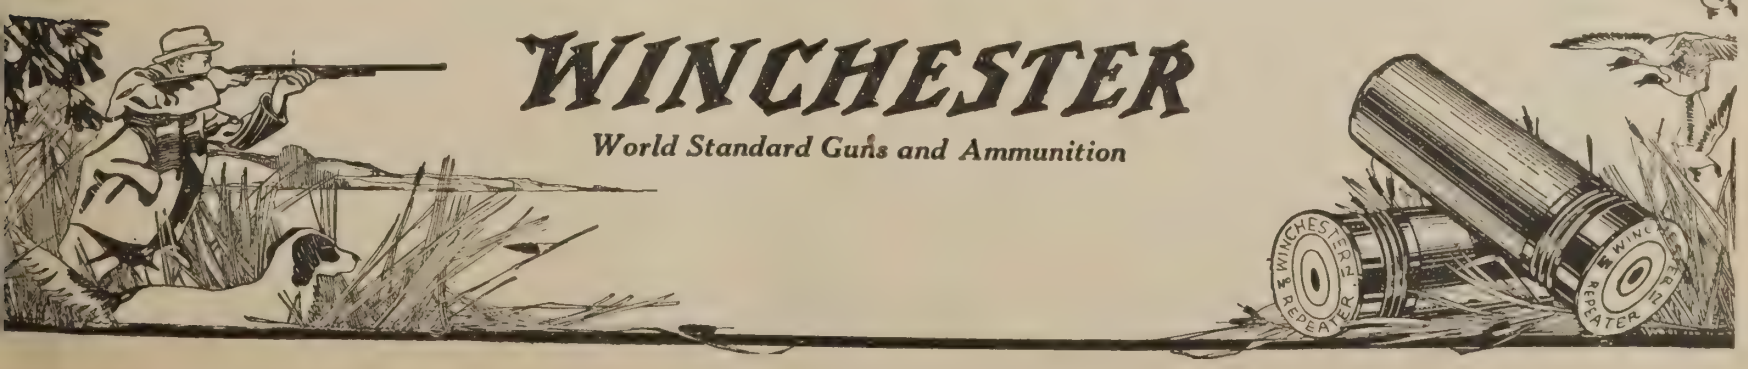
Combustion spreads instantly through the powder charge. By the time the top grains of powder become ignited the *full* energy of the burning powder behind is at work. Though the explosion is almost instantaneous, it is none the less *Progressive,* the final energy and maximum *velocity* of the completely burned powder being developed at the *muzzle*, where it is most needed.

Meanwhile, under the heat of combustion, the tough, springy Winchester *Driving Wad* has expanded to fill the barrel snugly all around. No gas escapes. It is completely sealed in. The wadding *pushes* up the shot evenly.

At the muzzle the shot pellets slip out without jamming, while the wadding is checked for a brief interval by the constriction of the muzzle. *It follows some distance behind the shot pattern.*

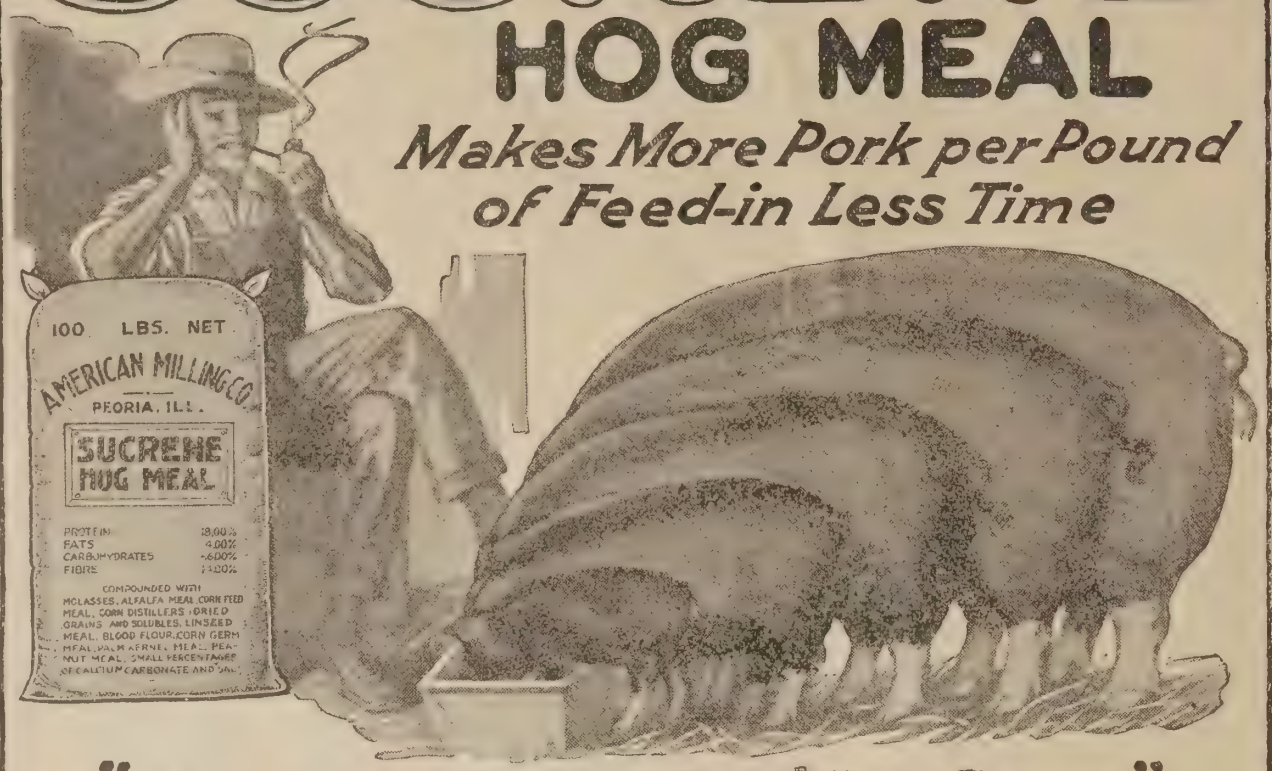
The shot cluster travels on unbroken by gas blast or wadding and makes the hard hitting, uniform pattern for which Winchester shot shells are world famous.

Fish Tail Flash All Winchester smokeless shells are made with the new Winchester Primer—the quickest and most powerful shot shell primer made. Its broad *fish tail* flash gives even and thorough ignition. Every grain of powder is completely burned up before the shot charge leaves the muzzle.



The Crimp The required degree of pressure necessary in seating the driving wads is worked out in combination with the *hardness* or the *softness* of the *crimping* required for any particular shell.

Water-proofing and Lubrication In the cold, damp air of the marshes, or under the blazing sun at the traps, Winchester shells will always play true. Winchester water-proofing process prevents them from swelling from dampness. Special lubrication of the paper fibres prevents brittleness and "splitting" in dry weather.



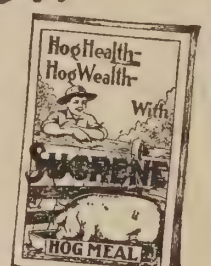
Uniform Shells From primer to crimp, Winchester shells are constructed to insure the maximum pattern possible from any load and under all conditions. $100,000 is spent annually in the inspection and testing of finished shot shells. 25,000,000 rounds of ammunition are fired every year in testing guns and ammunition.

Clean hits and more of them

To insure more hits and cleaner hits in the field or at the traps, be sure your shells are Winchester Leader and Repeater for Smokeless; Nublack and New Rival for Black Powder. Write for our Free Booklet on Shells. **Winchester Repeating Arms Co., Dept. E-11, New Haven, Conn.**

SUCRENE
HOG MEAL
Makes More Pork per Pound of Feed-in Less Time

"You Can Fairly See 'Em Grow"



Sucrene Hog Meal speeds up pork production far beyond any ordinary hog feed; eliminates all uncertainty about feeding hogs for healthy, vigorous, rapid growth and quick, high-grade finish; produces more and better pork per pound of feed, because:

1—It is a complete, correctly balanced pork-making ration, composed entirely of standard quality feeding materials.

2—It is so appetizing that hogs relish it keenly—eat more in excess of their daily maintenance needs, which means gaining weight rapidly.

3—It is so easily digested that hogs get the full benefit of all they eat—no 25% waste as in feeding corn.

4—It contains health promoting materials—Blood Flour and Molasses—which, besides having highest feeding value, possess strong corrective qualities for stomach and bowels, reducing to a minimum the chances of set-backs and loss by disease.

Get This Free Book On care and scientific feeding of pigs and hogs. Reliable information, indispensable to successful hog raising. Tells about diseases of hogs—prevention and cure.

Please send me illustrated literature on feeds checked below: (4)

Advantages of a Silo

The following advantages of a si are given by F. B. Mumford, dean the University of Missouri College Agriculture:

1. The silo provides a means saving a larger percentage of the nu trients in the corn crop, especially case of drouth, early frost, or failu to mature.

2. The silo conserves the nutrien of the entire corn plant in a palatab form.

3. Silage is succulent and provid conditions in winter similar to sum mer pasture.

4. The silo insures a saving of tim and labor in winter feeding. Th farmer does not have to wade throug snow and mud to haul feed from th fields in stormy weather.

5. Silage furnishes a unifor quality of feed and puts bloom an good coats on live stock in winter.

6. More feed can be stored in th form of silage than in the form fodder or hay.

7. Acre for acre, silage is mo efficient as a feed than fodder.

8. Silage can be used profitably a a supplement to pastures in summe

9. Silage properly made is a goo feed for horses, cattle, and sheep. increases the flow of milk in winte when prices are highest, thus loweri the cost of production, and increasi the profits.

10. Silage reduces the cost of bee production, is economical for mai taining breeding animals, and kee young stock thrifty and growing a winter.

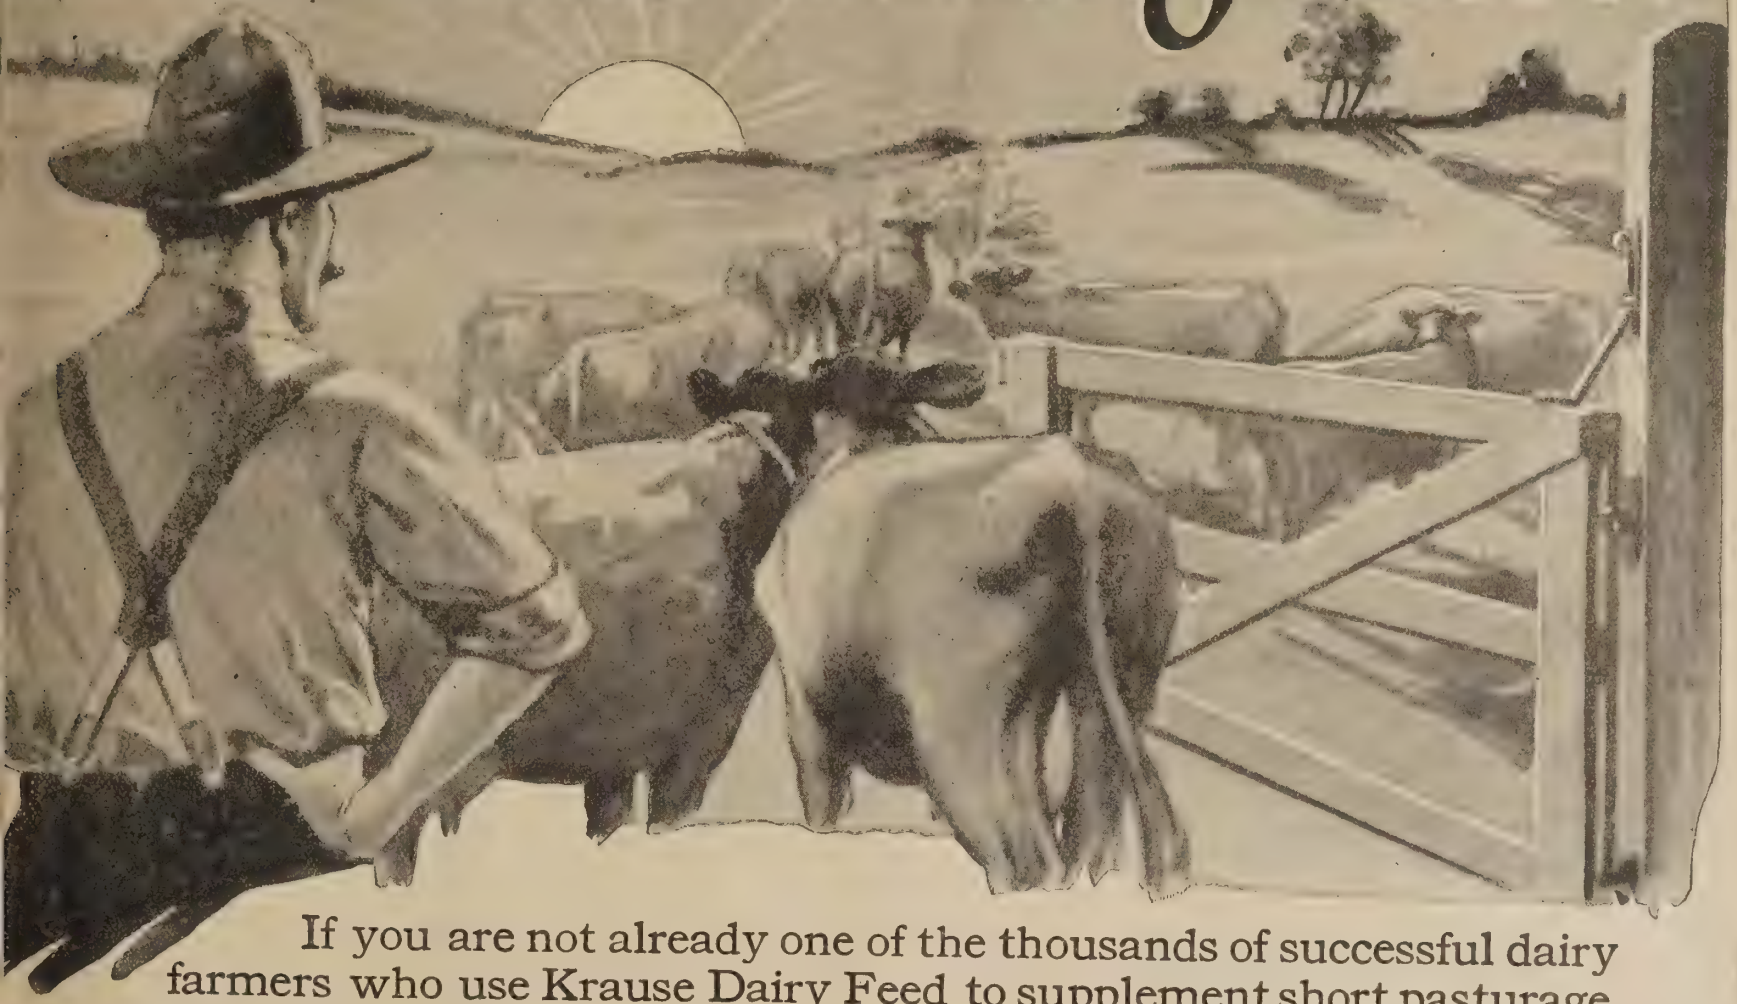
Army Food Prices

Prices paid by the subsistence div sion of the Quartermaster Corps fo the most important articles of fo supplies to the camps and canto ments in the month of July were follows:

The base price for army beef July was $23.05 per hundred poun at Chicago. The army cut of beef worth $1 per hundredweight mo than the standard cut. Hams we purchased at 31 cents per pound, d livered at camps, and bacon at 43 cents per pound, delivered at camp

July purchases of butter were ma on an average of 42½ cents p pound f. o. b. Chicago, and 43 cents delivered at camps. July pric for oleomargarine were 26¼ cen per pound, f. o. b. Chicago, and on a average of 27½ cents per pound d livered at camps. The price for la was 26½ cents delivered at cam and for lard substitutes 21¾ cen per pound delivered at camps.

Flour was purchased at $11.10 p barrel of 196 pounds, packed in 9 pound sacks, f. o. b. Chicago. T average price for sugar was $7. per hundred pounds, f. o. b. seaboa refineries. Potatoes were purchas at an average cost of $2.84 per hu dred pounds delivered at camps a the average price paid for onions July was $2.97 per hundred poun delivered at camps.



Barrenness

Please let us know what is the best tre ment for cows that fail to come in heat, ca ing being normal.

Fennville, Mich. J. B.

The best treatment is to have t ovaries massaged by a qualified vete inarian who has had special trainin and experience in such work. It is do to break down ovarian cysts, som times the cause of barrenness, and will also treat the womb, if he fin that necessary. Meanwhile it m help if you syringe out the vagi two or three times a week with luk warm water containing one teaspoo ful of coal tar disinfectant to t quart.

Is the Grass Getting Short?

If you are not already one of the thousands of successful dairy farmers who use Krause Dairy Feed to supplement short pasturage, you will find it exceptionally well adapted to your present feeding needs.

If your pastures have dried up altogether and your supply of other green stuff is short, it can be fed alone with splendid results or easily combined with any home-grown grains or green stuffs which are available for immediate use.

Krause Dairy Feed is a complete dairy ration with a protein content of 24% to 25%. Fed alone or in combination with any other feeds it is a sure and consistent money maker that will not only increase and sustain your milk flow but will promote the steady growth of young stock and keep your entire herd in "first premium" condition the year round.

KRAUSE DAIRY FEED

r claims for Krause Dairy d are based on actual re-s, not theory. Thousands successful dairy farmers e been feeding it for years, their testimony has es-lished beyond question t Krause is a high grade able feed.

Krause Dairy Feed has been worked out on a scientifically correct basis. Its formula takes into consideration the great variation of feeding requirements in different sections and the necessity of its being adapted to individual needs of cows of all breeds. It's a perfectly balanced combination of nine of the best milk producing feed stuffs obtainable, namely, Distillers Grains, Gluten Feed, Cotton Seed Meal, Wheat Bran, Malt Sprouts, Hominy Feed, Linseed Meal, Brewers' Grains, Wheat Middlings and a small percentage of salt. No other dairy feed on the market is so well combined as to protein content, carbo-hydrates, fat and fibre—is so nutritious, palatable and dependable.

You will find Krause Dairy Feed a twelve-months-in-the-year ration that will completely and profitably meet your feeding requirements. Have your dealer supply you with it now and let your cows give you the testimony that counts the most. Send for free sample, also free record book and other literature.

Buy Your Winter Feed *Now*

WHETHER you buy Krause Dairy Feed or any other feed, we advise you to lay in your winter stock at once. You will make money because the prices of all feeds are lower now than they will be later.

Furthermore, you will be sure of getting your feed. If you wait until later, shipping delays, which promise to be even worse than last season, may make your supply very uncertain.

The farmer who is obliged to feed his high priced grains this fall and winter will be feeding real money. If he secures his winter supply now he will be saving for himself and helping to relieve the serious freight situation.

PAIGE

The Most Beautiful Car in America

The "Preferred Investment"

The wise man selects his motor car investment in much the same way that he selects a first mortgage bond or any other high grade security.

He looks for permanent, enduring *quality*—not mere surface veneer. He looks to the integrity of the manufacturer, the critical expressions of the average owner and the history of the product over a period of years.

It is on this basis that we would have you consider the Paige.

From the standpoint of initial cost, ours is not a cheap motor car. There are many cars on the market that sell for less money than the Paige and we could readily build them ourselves if we considered that the best policy. But we don't.

We firmly believe that self-respect, comfort, and enduring satisfaction have an actual market value. So we build those things into our product.

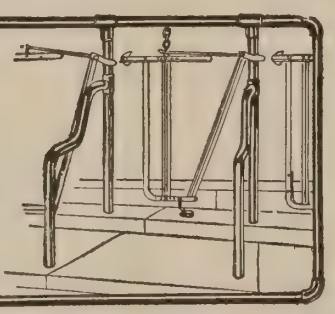
We take just a little more time—just a little more care in the selection of materials—just a little more pride in our work. And the result is a real motor car—not a makeshift or compromise.

In brief, while we agree that first cost is an important consideration we are convinced that *Ultimate* cost is vastly *more* important.

We believe that the only true test of economy is twelve months of hard, gruelling service on the road.

We believe that freedom from repair bills and excessive depreciation are infinitely more desirable than a mere catch-penny list price.

These are our convictions. We have held to them staunchly during many fitful periods in the motor car industry. So long as the Paige Company is a factor in the making and distributing of motor cars, we shall continue to adhere to them.



And it is because of these convictions, and their practical application to manufacturing, that the Paige car is regarded as a "Preferred Investment" in every automobile mart of the world.

Prices subject to change without notice.

Advice is given free in this department. Inquires must be signed by the writer and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Blood in Milk

Kindly give me remedy for cow giving occasional bloody milk. Don't think it is from injury.

Culpeper, Va. F. P.

There are several different causes of blood in milk and the exact cause should, if possible, be determined that intelligent treatment may be given. When blood appears in the milk from all quarters of the udder just after calving, the cause is congestion, which brings on rupture of small blood vessels. This condition usually subsides in a week or two. An attack of mammitis (garget) also may cause blood staining of milk, more especially when the disease has become chronic. Other common causes are injury and bleeding of growths in the teats irritated by the act of milking. Growths sometimes may be removed by operation but when high up in the udder often necessitates drying off of the milk secretion. In other cases bathing the udder with cold water three time daily and once daily giving a teaspoonful of powdered copperas and three of salt in the feed sometimes proves effective. Copperas should not however, be given to a cow that is heavy in calf. If our inquirer care to send full particulars we shall be glad to give special advice.

Paralysis

I have a registered Holstein heifer, 2 months old, that had a calf June 30. The calf was very large and she lost it. The afterbirt came all right but the heifer is weak in th back and can not get up. She can't use he hind legs, that is, can't stand on them. He bowels and kidneys act all right; she has good appetite and seems all right in ever other way. She prefers to lie on her left sid most of the time. She tries to get up an moves herself around at will, that is, with he front feet. I have been bathing her with sa and water and feeding her bran twice a day with all the alfalfa hay she will eat up clear three times a day. Ought she to be gotten u with pullies? Is there anything that I ca give her or put on her?

Stafford, Kans. F. Mc.

We suspect that the pelvis wa split at calving time or there ma simply have been an injury to th nerves of the pelvic region. Do no allow the cow to lie upon her side Keep her propped upon her chest an pull out and forward the opposit hind leg every three or four hours t give her a change of position. Kee her bowels active. Add whole oat and oil meal to the bran. Slingin will do no good but it would be wel for the veterinarian to give stimu lants including nux vomica.

Leaking Teat

Please let me know what will cure a two year-old, high grade Holstein heifer tha leaks her milk in the pasture.

Chateaugay, N. Y. T. E. C.

We do not know of any way to cur a cow of leaking her milk, but it i possible to stop it for as long as th remedy is practical. One way is t put fairly wide rubber bands aroun the teat to be worn between milking These should not be tight enough t stop the blood flow. Wide pieces o tape can be used in place of the rub ber bands.

Another method is to put a littl collodion on the end of the teat afte milking. It must, of course, be re moved at the next milking.

Fruits can be preserved in grap juice or apple juice in place of a sug ar syrup. Extract the juice from ver ripe fruit and boil down to one-ha the volume to form a thin grape o apple syrup.

JERSEYS *The* PROFIT BREED

The pump has been blamed for much watered milk that really came from poor cows. Why waste feed on cows that skim their own milk when Jerseys will produce the highest percentage of butter fat at the lowest feed cost? **Raise the standard of your herd to the highest degree with Jerseys.** The man who begins with one Jersey is never satisfied until he has a herd. He can see the profit without close figuring. Start now. Write to Breeders for pedigrees and prices. Let us send you the Jersey facts that will open your eyes to the possibilities of this money-making breed.

S. A. BAIRD & SON, Waukesha, Wis.

KING SUPERBA

King Superba's Dam is the great Milanhurst America De Kol, World's Record 4-year-old, with 1231 lbs. butter in 365 days, and 28 lbs. butter nine months after calving. Eight of her records have never been equaled in all respects by any other cow. Come and see his sons and daughters at the Wisconsin State Fair, Sept. 9th to 14th. (See W. J. Mann & Sons ad.)
BAIRD BROTHERS, Waukesha, Wis.

FINE BULL CALF

We offer a bull calf born Nov. 19th, 1917. A very fine, straight, growthy individual ¾ white; dam has 7-day A. R. O. of 24.6 lbs. butter and 567 lbs. milk. He is by a sire whose two nearest dams average 22.3 lbs. butter and 520 lbs. milk at 3 years. Price $125.00 if taken at once.
Miller Bros., R. No. 25, Oconomowoc, Wis.

RUST BROS., WEST ALLIS

Size, good individuality and large 7-day and semi-official yearly records are the points for which our herd is noted. The following are two of our records: Aaltje Salo Netherland Pontiac has 33.3 lbs. in 7 days and 134.8 lbs. in 30 da. Ida Lotta 5th 29.74 lbs. in 7 days at 4½ yrs., 27.12 lbs. in 7 days and 816.9 in 365 days at three yrs. We now have a couple serviceable young bulls from A. R. O. dams for sale.
RUST BROTHERS, West Allis, Wis.

GRAMLING BROS.
Dousman, Wis.

KING SUPERBA

Meet his sons and daughters on exhibition in the Waukesha County Live Stock Exhibit, at the Wisconsin State Fair. Combine individuality with production. For Sale—Sons of King out of our best cows. (See Baird Bros. ad.)
W. J. Mann & Sons, R. 2, B. 16, Waukesha, Wis.

MORE MILK—MORE MONEY

Get a grandson of this great cow, Milanhurst America DeKol, 143441, that produced an 8-gallon can and a ½ of milk per day equal to 13 tons, or more than her own weight each month for a whole year. If her milk was sold at 10c a quart her years production would amount to $1,300. A few choice bulls for sale, some of breeding age.
Dr. David Roberts Stock Farm, Waukesha, Wis.

BELLEVIEW STOCK FARM

Breeds the big, high producing kind. We are now offering for sale a few good sons and daughters of Aaltje Salo Johanna Pontiac 57169.
E. B. WATROUS, - Troy Center, Wis.

We Offer Three Young Bulls

4 mos. of age sired by Sir Pietertje Ormsby Mercedes 43d whose dam and sire are among the greatest of the breed. They are out of high producing A. R. O. dams. Send for photo and pedigree. Herd on U. S. Accredited List. We will price these bulls cheap because they are young. A good chance for your next year's sire.

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Walcowis Farms

OFFER SON OF

IOWANA SIR OLLIE

Sire of state record jr. 2-yr.-old. Dam, a granddaughter of King of the Pontiacs and first prize winner at National Dairy Show, made 27.70 lbs. butter from 624 lbs. milk in 7 days. Best day's milk, 101.5 lbs. Calf was born April 8, 1918, is evenly marked and a splendid individual. Write now for price, pedigree and photo.

N. DICKINSON & SON,
Lake Geneva, - - Wisconsin.

FOR SALE—Registered Holsteins

Young Bulls—5 to 10 months old, 2 sired by Johanna King Segis, the 40-lb. bull; 1 by the show bull, Beauty Walker Pietertje King; 2 by our splendid senior herd sire, Czar Walker 2d. We also have 7 beautiful heifers 4 to 15 months old sired by King and Czar above mentioned. *Eight well bred cows*, safe in calf to Czar 2d, offered. Must sell because of shortage of feed. Breeders, not dealers.
Elm Leaf Stock Farm, Bear Creek, Waupaca County, Wis.
Jas. McKone, Prop. Wm. Lucia, Manager.

Milford Meadows Stock Farm

Now Offers For Sale

M. M. Rag Apple Oak Denver

A most promising young sire, born June 4, '17. Nearly half white and an exceptionally good individual.

His sire is Dutchland Creamelle Denver Prince, a 36.25-lb. grandson of Colantha Johanna Lad.

His dam, Milford Josephine Oak DeKol, made 22.82 lbs. butter as a junior 2-year-old in June. Her sire is a son of Canary Paul Fobes Homestead and from a 29.55-lb. daughter of Homestead Junior DeKol. Her dam, 31.77 lbs. butter, 616.2 lbs. milk, is a granddaughter of Dutchland Sir Pontiac Rag Apple.

The three nearest dams of this young sire average over 30 lbs., one a junior 2-year-old. His dam is one of our good prospects and is to be retested this winter.

Highland View Place, - Whitewater, Wis.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

The E. C. Schroeder Farms, Box 576-H, Moorhead, Minn.

HEAD YOUR HERD WITH

A Young Bull of Ormsby Quality

One that has been bred for both production and individuality. A son of

Sir Ormsby Banostine Champion

will exactly fill the requirements. We have a few excellent youngsters by this royally bred sire. Write today for full information.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

Quality Heifers For Sale

I offer twelve head Granddaughters of Colantha Johanna Lad and Dutchland Creamelle Korndyke Lad.

They are large, beautiful markings and perfect specimens of the breed. Not a cull in the lot. They are from 14 to 18 mos. old, are all open but arrangements can be made to breed them to a 32.55-lb. bull whose dam has beaten 31 lbs. in three consecutive years. They are out of a tuberculin tested herd that is entirely free from abortion or any known disease and the heifers will be tested to go anywhere. They will be sold as one bunch. Price $3000.00. **THOS. L. J. REESE, Montoursville, Pa.**

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a better combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.

We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.

This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.

River Meadow Farms, Portlandville, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 12 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

Lakeside Herd

Best Bulls For the Money

State about amount to be invested, with quality required. I will describe the best for the amount. Large number of females to select from, all ages. Highest individuality, large production, best type, best udders are characteristics of Lakeside Herd. **E. A. POWELL, Syracuse, N. Y.**

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. **F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.**

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI — FORT ATKINSON, WIS., SEPTEMBER 13, 1918 — Number 8

ncreasing Consumption of Dairy Products

ERNEST KELLY, In Charge of Market Milk Investigations, United States Department of Agricu'ture

' it not necessary to spend time in arguing the fact that the consumpon of dairy products should be ineased. Anyone who has studied the od situation and the needs of the man race must admit the truth of e assertion. There is much talk at rtain times about a "surplus" of iry products. While there may be apparent surplus e to high production d low demand, there in reality, no true rplus. Even at the ight of our produce periods we, as a tion, do not raise ore dairy products an we should properconsume. Obviously en, something must done to increase nsumption to keep ace with production; nd even to stimulate reater production. hen supply exceeds emand, prices fall, and here is little encouragement for the proucer to enlarge his usiness.

Let us consider for a oment the quantity f dairy products used y the population of his country. It has een estimated that in 917, the average citien consumed approxiately the following mounts yearly:

ilk	170 quarts
utter	17½ pounds
heese	3¾ pounds
e cream	2 gallons

This would give a daily allowance f:

ilk	less than 1 pint
utter	about ¾ of an ounce
heese	about ⅛ of an ounce
e cream	less than ½ ounce

You could put all this butter, heese, and ice cream on a big spoon nd swallow it in one mouthful, washng it down with the milk. It would e laughable were it not so pitiful. Something like a dose of medicine to e gulped down in one dose.

What can be done to ameliorate his ridiculous condition? How can he consumption of dairy products be rought up to a sensible level? Three hings occur to me as being the basic actors in increasing demand:

1. Maintain the highest quality of product.
2. Keep prices as low as is consistent with quality.
3. Advertise: Educate the consumer to food value of products of milk.

The application of these principles involves the teachings of two old sayings. The first has been credited to Ralph Waldo Emerson, and is as follows: "If a man preach a better sermon, write a better book, or build a better mousetrap than his neighbor, though he hide himself in the wilderness, the world will make a beaten pathway to his door". The second maxim is shorter—"It pays to advertise". In modern business neither one of these mottoes will stand alone; but together they will turn the trick. It is true that superior goods will find a market but the rapidity with which they get into commercial channels depends upon advertising. Again, it does not pay to advertise goods that will not satisfy the consumer.

HARVEST TIME IN THE AMERICAN CORN BELT

Keeping in Quality

No matter how low the price, a permanent market cannot be established if quality of goods is not maintained. I do not wish to be misunderstood on this point. First sales and new customers are important because they serve as an introduction between producer and consumer. But if you meet another man, you do not accept him because of the introduction, but size up his qualities before making him your friend. However, introductions are useful, and many firms consider them so important that they make special offers to meet new people; for example, trial subscriptions to periodicals and samples of various commodities.

But, after all, it is the subsequent sales that build up a paying business; and no one will continue to buy if he is disappointed in the quality of the product. There is no doubt that poor quality in dairy products has often limited sales. The housekeeper who receives sour or strongly flavored milk will either reduce or discontinue her order. It is a well known fact that people will eat more of good butter than they will where a poor quality is set before them.

Certainly dairymen have much food for thought regarding this situation.

Maintaining a Fair Price

A good article is worth a fair price and should not be sold for less; neither should it be sold for more. The producer of reputable goods is entitled to receive cost of production and marketing plus a reasonable profit; otherwise, he must go out of business and an essential industry is thereby crippled. If the goods are sold at more than a fair profit, it wrongs the industry and the consumer as well. Generally speaking, the lower the price the greater the volume of sales. Consumers have the right to expect producers and manufacturers to apply such business methods to their work that wasteful practices are eliminated. Applied to the dairy industry, this means that individual dairymen and milk dealers should put production and distribution on an economical basis, then they should get a price as low as is consistent with quality and reasonable profits.

There are three classes of buyers. The first is relatively small, and is composed of those who are able to disregard price. The second and largest class are those persons who most carefully consider the relative questions of price and quality. The great bulk of purchasers of dairy products are in this class. The third class, fortunately a small one, includes those who buy the cheapest thing that is offered, regardless of quality. Dairymen can sell certain specialized products to the first class. The second class is the important one to reach. Reputable dairymen will do well to ignore the third class.

Many people, when convinced of the value of certain articles, cheerfully pay the higher price. On the other hand, there are many who realize that the articles are valuable; but when prices are high they cut down their consumption.

Therefore, high prices, even when plausibly explained, tend to reduce demand. On the whole, however, the public are becoming better educated. They are learning the real value of milk.

Advertising

Everybody is familiar with the advertising man's explanation of the fact that hen's eggs are more in demand than duck's eggs; the reason being that after laying an egg the duck waddled silently away while the hen cackled,—ergo, "It pays to advertise".

In the dairy industry, advertising is in its infancy. There have been some very good examples of individual and co-operative advertising; but the work must be pushed to the limit, and we don't know yet just where the limit will be. Certainly we haven't

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

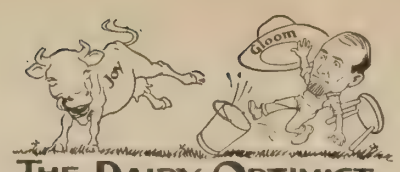
Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.



Entered at Fort Atkinson, Wis., as second class matter.

Sweeten up with Sorghum

Sorghum was introduced into this country from China and Africa a little more than fifty years ago and the culture spread rapidly. Many a little home learned to depend on sorghum syrup to replace sugar both on the table and in preserving. When the Civil War cut off Louisiana cane sugar, the North developed a liking for sorghum syrup. The present world sugar shortage has again raised sorghum from the ranks.

Sorghum is not like molasses, a sugar-house by-product, but an unmixed syrup made directly from sorghum cane by crushing and boiling. The grade and color of the syrup will depend on the making. If the syrup is allowed to caramel or burn on the side of the pan, a dark, strong syrup will result. Lime is used by some makers to overcome the acidity of the raw juice. Where this has not been done in the making, housekeepers frequently heat the syrup with a pinch of soda before using it.

When a well-made, light syrup has been produced the next point is to prevent fermentation, for after all the tang of sorghum syrup is mostly due to fermentation. Syrup that has been thoroughly sterilized by boiling will not ferment if poured hot into sterilized containers and sealed immediately. The tin quart can is the most convenient container for family use. Store in a cool place and you have a good all-winter table syrup and a fair substitute for sugar in desserts and jam making. When recipes call for sugar use half and half sorghum and corn syrup or sorghum and sugar or use sorghum alone.—U. S. Food Administration.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

In Blackberry Time

The patter of a boy's bare feet along the country road;
A little song—a happy song, he always liked to sing.
A meadow and a chummy stream that gurgled as it flowed.
The perfumed air of summer time, still mellow-like, from spring,
And, Oh, the freedom of the world—the mysteries of earth!
The haunted paths of fern and leaf, inviting you and me!
Fair memories of youth come back—its gladness and its mirth.
The heart-throb of your yesterdays—and mine—that used to be!

We push through realms of scented shrub and where the dogwoods grew;
We pass the shrine of violets that sleep a little while.
The honey suckle's past and gone, and flags are missing, too,
The slim, young trees are more mature along each gypsy mile.
But, Oh! the pungent berry-smell. The clusters of them there—
The reds and blacks and amber-gleam! The freckled hand outspread.
And you staked off a berry-claim in some dim-shadowed lair,
And I, with pitter-patter heart, swooped on a treasure-bed.

Each bucket tinkled to their fall—the berries, one by one;
The growing hoard of wildwood sweets that stained our fingers red.
A catbird, in a thicket, called—(He, too, enjoyed the fun)
Whilst tiny shafts of golden light stole down from overhead.
And, Oh! the wonder of it all! The silence—half a prayer.
The twilight on the country road—the last home-going bee,
The berry pails, the growing dusk, the shy stars, everywhere,
The spirit of the Infinite that sang in you and me!

"How does your new hand make out with the tractor?

"Fine, he used to be a city chauffeur. It keeps him busy every second trying to find somebody to run over."

Fables of the Dairy

Once upon a time there was a dairyman who built up quite a sizable place. Every time he saw a cow for sale—cheap—he bought it and added it to his herd. "The thing figures out easy," said he, "the more cows the more profit. If I keep adding them fast enough, I can retire in a few years."

In the meanwhile, he was astonished and aggrieved to find that the chap across the road from him, with only ten cows, made more profit than he did at the end of the first year.

Moral—The other fellow bought only good stock.

"Got a butter trier on your place?"

"That's th' trouble—everybody workin' fer me is one."

If Women Run the Farms

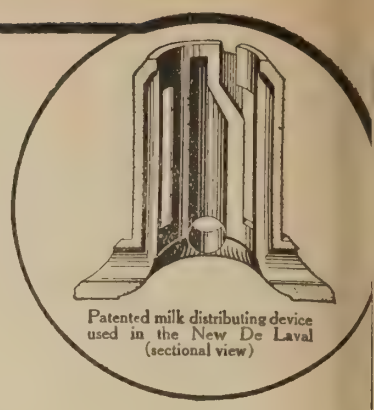
(It has been suggested, that if the war lasts long enough, women folks will run the dairy farms. A mad wag puts these down as possible styles.)

Flowered wall paper in all barns.

When not working, blue ribbons on teats.

All fat hawgs made to wear corsets.

Farm hands in evening dress after six.



Tractors supplied with three speeds and orchid holders.

Roses planted in all manure piles.

Layettes for calves.

Dandelion, rabbits, and taxes will never be exterminated, no matter how long the war lasts.

Patented milk distributing device used in the New De Laval (sectional view)

Some big advantages that you can obtain only in the

NEW DE LAVAL
CREAM SEPARATOR

GREATER CAPACITY: Without increasing the size or weight of the new bowl, its capacity has been increased.

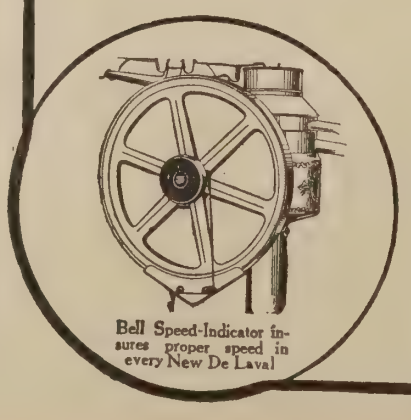
CLOSER SKIMMING: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

EASIER TO WASH: Simpler bowl construction and discs, caulked only on the upper side, make the bowl easier to wash.

HAS SPEED INDICATOR: Every New DeLaval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures full capacity, thorough separation, proper speed and uniform cream.

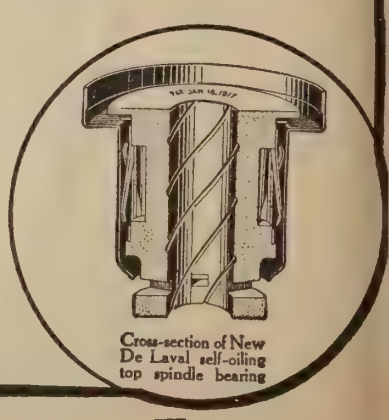
EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

WEARS LONGER: Due to its much lower bowl speed, high grade of materials used, and careful and exacting workmanship, the De Laval outlasts and outwears other makes by far.



ASSURED SERVICE: In almost every locality there is a De Laval representative, able and ready to serve De Laval users.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval at once. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.



Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

Bread-'n-Butter-'n-Jam

WM. H. CRAWFORD, New York

VERYBODY admits that the Amer- ican soldiers overseas are just ›ut the greatest fighters in the rld. But when it comes to meal ıe the valiant warriors turn back o little boys. They want jam on ir bread and butter. They simply ist upon all the sweets they can

Several thousand American boys er in France were demanding ad-and-butter-and-jam. It was easy enough matter for the army supply them with the bread and tter, of course, but the men in ıki wilfully insisted that it was the n that made the other foodstuffs atable.

The matter came to the attention Roy John, one of the divisional retaries of the Y. M. C. A.

'If the men want jam on their ad and butter they have got to e it," he declared.

'But there isn't any jam!" object- the army officials.

'I'll find some jam, or make it," mised Mr. John.

As it turned out, he had to make The district in which he was sta- ned was rich in fruits, and at last unearthed a jam factory which had en closed down because of the war. e Y. M. C. A. went on a still hunt for sugar, and within a few days had turned out 12,000 three-franc pails of jam, underselling the local market by fifty centimes or ten cents on each pail. Another 25 centimes was to be returned to each soldier when he returned the pail, but he never did return it. Nowadays you can see the boys in khaki going about with jam pails fastened to their belts, and on their faces the expressions of small boys who have been rifling the top shelf.

The demand for candy was even more urgent, if possible. Mr. John discovered a candy factory that had been closed because of the war, but at first thought this didn't seem to help much, since he hadn't any sugar. He went to the army officials.

"I'll give you two pounds of candy for every pound of sugar you'll furnish me from the commissary," he said. "Will you do it?"

"Will we?" said the army.

Chocolate was secured from a local manufacturer, and now the "Y" is turning out for American soldiers in that locality 600 lbs. of first class chocolate cream candy every week.

In the same way, the Y. M. C. A. and the army have co-operated in the making of cookies and macaroons and cakes for American soldiers.

The commissary furnished the sugar and the flour and the "Y" turned out the finished product. The Y. M. C. A. is able now to furnish macaroons two francs under the market price, and it makes real American biscuit, and glazed fondant and cookies that would make the mouth of any fighter water. Eight tons of cake have been turned out already, and more is in the oven baking.

EARL BALLEU, Y. M. C. A. WORKER, GIVING CHOCOLATE AND SMOKES TO SENTRIES IN ADVANCED LISTENING POST. THIS IS THE EXTREME ADVANCED POSITION ON THE ACTIVE FRONT

MAKING CHEESE AT HOME

ROSE SEELYE MILLER, South Dakota

OR many years we have made cheese at home for home consumpn and at one time for commercial rposes. The method used is one of simplest possible. Any one who ı follow instructions can make eese acceptably, and add to the nu something rich in nutrient val- as well as appetizing. This is no oretical recipe, but one tried out generations.

Only the most common utensils are uired. About the only things one eds to buy is a cheese hoop, cheese or, and rennet tablets, and even cheese hoop may be made from a pail or can by cutting off both top l bottom to leave a smooth edge, that the cheese may be turned and moved from either end. We had a eese hoop made from galvanized n and it has lasted through many ars. We think a heavy, unrusting would be better, as the galvanized n is not easy to keep looking well. follower is needed for the hoop, l we use one cut from wood, just slip in the hoop readily, with a han- fixed to it to make removal pos- le.

The utensils we use are a large cop- boiler for holding the milk, a bowl dip whey, and a kettle to heat the ey for the finish. If one has more k than enough for a boiler, a clean sh tub is all right.

Rennet tablets can be bought at al- st any drug store. Ask for se for cheese making. There are lets made for making junkets and se are not strong enough for ese. The tablets come in different es; we prefer the ones for one hun- d pounds of milk. Cheese color ts the same as butter color and is up by the butter color companies. you cannot get these things at the ne druggists, it will be perfectly e to send to any dairy supply house large city druggist.

We use from two to three milkings a cheese, depending upon how ch milk we have or how much ese we want to make. A small ese cures quicker, and so comes to use sooner than a large one. Save the night's milk in a utensil which is open and stir the milk as often as convenient; do not cool rapidly, as rapid cooling causes the rising of the cream. The object is to keep the cream in solution in the milk. In the morning bring the night's milk to about eighty degrees by a dairy thermometer and add the milk direct from the cows, which will probably be ninety degrees. The milk for the cheese should be just eighty-five degrees Fahrenheit. A greater degree of heat causes the cheese to be tough, and a less degree causes the curd to be soft, the whey to be difficult in dipping off, and releases too much of the butterfat. Do not skim the night's milk. If managed right, by cooling slowly and stirring often, only a little cream rises; stir this in as much as possible. Keeping the milk covered will help to keep the cream from rising and being thick.

Having the milk at eighty-five degrees, place it in whatever receptacle you wish it for cheese making. For one hundred pounds of milk dissolve one of the rennet tablets in water. Add it to the milk and stir well. Any cream dipper or long handled spoon or even a bread knife will do to stir it. Add the cheese color in the proportion of one tablespoonful for a hundred pounds of milk, making the measure scant rather than otherwise. Stir this in and put a cloth cover over the product. Nothing more to do to this for an hour, and the usual run of housework can be done while the cheese is "setting".

In an hour press the thumb into the milk, and if it is resilient, thick like clabbered milk, and a little whey exudes as you break the surface, it is ready to cut. We use a common, long bread knife and cut the thick milk into squares about an inch or more in size. Cut to the bottom of the milk. Let stand a few minutes, when the whey begins to come to the top. Wet a cheese cloth, or a thin cotton flour sack will do; spread this cloth over the top and let it sag into the whey, and with a bowl dip off all that exudes. Dip carefully. All work should be done gently in order that the cream may not be released. Move about from place to place over the surface of the curd, and when you have dipped as much as can be removed, either let it stand a little while, or else reach the hands into the curd and break it carefully. This will release more whey. Usually two breakings of the curd will release all of it, or as much as can be dipped off.

When nearly all of the whey has been eliminated, we sometimes put the curd into the cloth and let it drain a few minutes. Put back in utensil, have about four quarts of whey heated to ninety degrees ready and pour this over the curd, breaking it gently with the hands. Pour this off, and if the curd squeaks a little as you break it, it is ready for the salt; but if it is soft and does not cling tenaciously together heat another kettle of whey and pour over, breaking the curd as before. Pour off and add salt in the proportion of about four tablespoonfuls to six or seven pounds of curd. Put a clean, wet cloth in a milk pail, lift the curd on to this cloth, and your cheese is made with less work and bother than a churning of butter.

Now for the press. We have an improvised way of pressing that gives good results. A two by four is nailed to an outbuilding three or four feet from the ground. A box is placed under this, and the cheese hoop upon the box, the curd is lifted into the hoop right in the cloth; it is levelled some with the hands, and the corners of the cloth are folded over as smoothly as may be, which isn't very smooth as a general thing. Put the "follower" on and slip it down till it touches the curd. If the curd fills the hoop, no blocks will be needed on the cover. Take a second two by four, and put one end under the two by four nailed to the building, forming a lever with cheese hook as the fulcrum. Let the weight of the two by four rest down upon the cover of the cheese. If the cover is sunk down into the hoop, put some blocks, or even some pieces of brick, on the cover to build it up enough so that the lever

(Continued on page 232)

GRADE GUERNSEY HEIFER OWNED BY D. K. DAVIS, ILLINOIS

In one year, beginning at 2 years, 5 months, she produced 8,320 lbs. milk containing 464.92 lbs. of fat. At market valuation of $.43 per pound, the heifer's yearly fat production was worth $199.91. She carried a calf 220 days of her test.

Iowa's Sixty-fourth Fair

IOWA held her sixty-fourth annual fair and exposition August 21 to 30. Considering the unusual difficulties attending the 1918 show circuit, the most optimistic must have failed to predict the large success of the week. The total number of exhibitors fell short of the 1,720 average for the past eight years and the total attendance hardly came up to the average total count of visitors for a like period, 276,646, but the final records will tribute liberally to the management of this, the first real war fair and exposition in the sixty-four Iowa has held.

Iowa is prosperous. While her total 1918 production will not come up to early estimates, increased prices give this year's crop the highest cash value ever known in the Hawkeye state. Unfavorable weather during part of the growing season limited the yields in some sections of the state, yet the returns from Iowa's acres will still be bounteous. Her cutting of hay was a bit short of normal but small grains yielded heavily. Drought in the southwest ten or twelve counties has reduced their corn crop fifty per cent while excessive rains injured many fields in the North. Even so, it is estimated that the 11,000,000 acres planted, some of which was reported past danger from frost fair week, will harvest 450,000,000 bushels.

College Exhibits

Two exhibits by departments of the State College of Agriculture were of practical wartime value to Iowa farmers. They pointed the way to the present single objective of progressive agriculturists, the production of increased crops with a minimum labor expenditure.

Nineteen counties of the state have soil surveys completed. These define the various types of soil so that recommendations concerning crop adaptations may be followed intelligently. The Soils Department of the College is doing a splendid service in thus assisting farmers in choosing the crops which will give them largest returns from their particular types of soil.

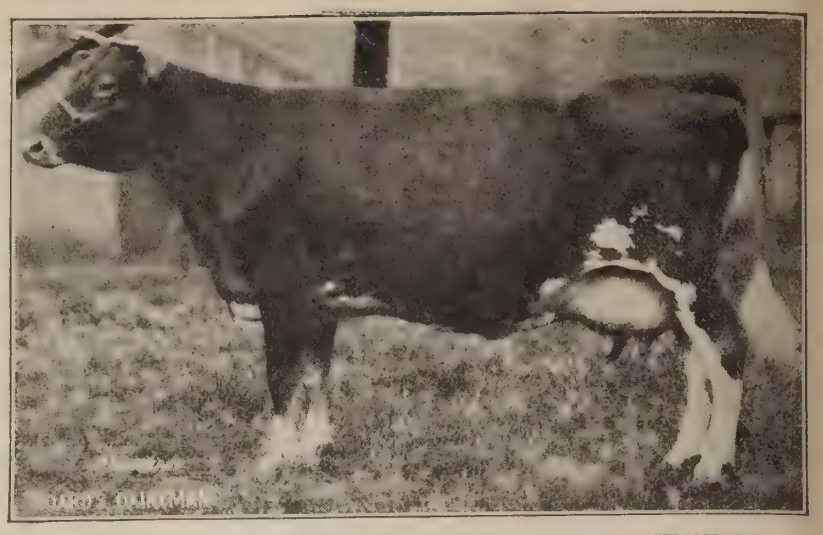
Experimental work on a large number of farms over the state is establishing the values of various fertilizers. In a four-year rotation the following amounts of products have been secured from the fertilizers used:

Crop	No treatment	Manure	Manure and limestone	Manure, limestone, rock phosphate	Manure, limestone, acid phosphate
Clover	4,096.0 lbs.	6,098.0 lbs.	6,751.0 lbs.	8,799.0 lbs.	10,367.0 lbs.
Oats	33.5 bus.	54.2 bus.	55.5 bus.	91.6 bus.	77.8 bus.
Corn	37.3 bus.	46.7 bus.	55.9 bus.	60.8 bus.	61.7 bus.
Wheat	19.3 bus.	26.1 bus.	24.0 bus.	24.3 bus.	27.5 bus.

"Stairway to Victory"

To save one-fifth on labor, increase profits twenty per cent, and quadruple profits! Figures gathered by the Farm Management Department from 832 farms, all in 12 townships, show how this may be done. The data presented by Professor H. B. Munger and O. G. Lloyd showed that improved efficiency in the use of labor on Iowa farms would: first, increase crop production enough to feed 3,000,000 soldiers for 4⅔ months and, second, would at the same time release 44,000 farm hands for army service. The statistics were presented graphically as the "Stairway to victory and prosperity by man power efficiency with proper farm organization and management", each factor being represented by the rise of a step in the stairway. The following gives the facts from the farm survey which may well be closely studied by every Iowa farmer and others under similar farm conditions:

	Ave. of all 832 farms	Ave. of 109 best farms
Profit per farm	$370	$1,433
Profits per man	261	896
Profits per acre	237	673
Lbs. of live stock per farm	21,800	37,900
Lbs. of pork per man	6,344	9,197
Bus. of wheat per man	223	401
Bus. of corn per man	1,001	1,378
Acres of crops per man	63	76
Acres of crops per horse	17	21
Acres of crops and live stock per man	123,000	172,000
Acres per farm	156	213



One deduction from this study is the pointed suggestion given with it, "Quarter acre corn belt farmers could use man power more efficiently if they would buy or rent 40 acres more rather than sell 40 acres."

Cow Testing Exhibit

A year ago last month Marshall County, Ia., started its first cow testing association with 450 cows. The 267 sold after records were begun were not all "boarder" cows but many of them were. At any rate the members could have a close idea of what these cows were able to return in profits before selling them. Last month when C. L. Blackman, in charge of association work in the state, went to Marshall County, he could not find a single animal not making a return above fed cost. Ten cows were selected, however, to illustrate three pointed dairy truths before the State Fair crowds: that cows must be tested to prove their worth, that the pure-bred sire is an almost certain means of improving, and that good care pays.

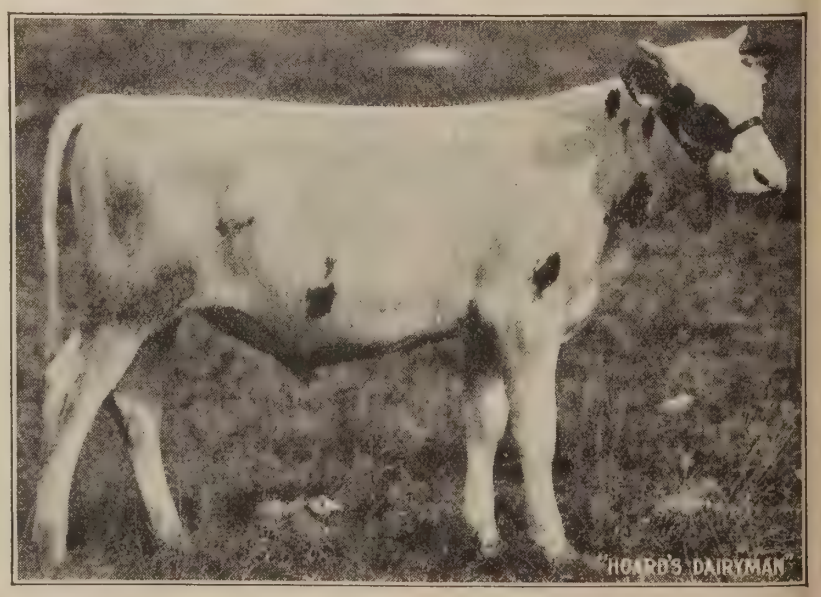
IMP. KENILWORTH GOLD, SENIOR AND GRAND CHAMPION GUERNSEY BULL AT THE IOWA STATE FAIR
OWNED BY W. W. MARSH, IOWA

IMP. BELLA 2D DU GRAND FORT, SENIOR AND GRAND CHAMPION GUERNSEY COW AT THE IOWA STATE FAIR
OWNED BY ISLAND FARM, MINNESOTA

A grade Shorthorn was exhibited which produced in a year 4,171 lbs. milk, 139 lbs. fat, test 3.3 per cent, and with a labor income of $32.54. Her 4-year-old daughter by a grade Shorthorn in six months made 4,252 lbs. milk, 160.2 lbs. fat, 3.8 test, and a labor income of $26.66. A 3-year-old daughter in a similar period has made as much fat from milk with a test an even per cent higher, and a labor income of $38.48, 44 per cent more than the half sister by a grade Shorthorn.

In another group comparison, a grade Holstein cow was shown which in the association made but 3,995 lbs. milk, 135.8 lbs. fat, 3.4 per cent fat, and a labor income of $22.64. Her 3-year-old heifer by a pure-bred Holstein bull produced 5,532 lbs. milk containing 204.3 lbs. fat and a labor income of $25.51. In six months a second daughter, a 2-year-old, produced 3,341 lbs. milk, 160.1 lbs. fat, 4.8 test. The labor income for this two-year-old was $28.27, a considerable improvement over the dam.

A third group of three cows well illustrated three kinds of association cows; a productive appearing animal with a good record (11,343 lbs. milk, 393.3 lbs. fat, 3.5 per cent test, and $99.2 labor income); a good typed, extremely low producer (4,613 lbs. milk, 133.7 lbs. fat, 2.9 per cent fat, and $10.97 labor income); and a poor typed, high producer (9,807 lbs. milk, 361.8 lbs. fat, 3.7 per cent fat, and $94.91 labor income). The comparison interested many farmers into trying to guess the records and led to the conclusion by a number that "the test is the only safe way".



A cow was shown which had made two records; one under poor management and one when she was given good care. In her second test, when well cared for, she made double the increase in production which a change from two- and three-year-old form to 4-year-old form would account for.

The exhibit, conducted under the direction of C. L. Blackman, had three specific lessons continually before many farmers. It accomplished a good deal toward improved dairying in Iowa.

Live Stock

The fact that this country is at war is nowhere more clearly in evidence than on the show circuit. Many of the familiar figures in the stables and around the ringside in other years are gone; many herds are not brought out because experienced help, so necessary to successful showing, cannot be secured. Some of the herds on the circuit were cared for by less than half the usual force. Pete Ledgaard showed eighteen head of Holsteins for the Cass Farm Co. and was alone in caring for them. Freight and feed charges are so high as to be practically prohibitive to many of the less wealthy exhibitors. Another factor reducing the number of animals is the active sale demand for nearly all classes of live stock. Several old time show men have sold so closely that they could not pick herds for the circuit.

An unfortunate conflict of date with the Illinois State Fair kept a number of herds away which would otherwise have been at Des Moines. Because of celebrating the State's Centennial, the Illinois fair management moved the dates ahead so that the days for the live stock show duplicated some of those set aside for many years for the Iowa Fair. Since herds were not released at Springfield so they could reach Des Moine

ROSEBUD'S PRIDE, GRAND CHAMPION AYRSHIRE BULL AT THE IOWA STATE FAIR

ALMEDA LUESKE HENGERVELD, SENIOR AND GRAND CHAMPION HOLSTEIN COW AT THE IOWA STATE FAIR
OWNED BY CASS FARM CO., IOWA

in time for showing, those which were exhibited at Sedalia had to lay over a week in order to appear at the Iowa Fair.

One of the best attractions at the whole fair was the exhibit of baby beeves from the Iowa boys' calf feeding contest. One hundred and seven calves were shown, 98 boys and one girl competing. Altogether in the state-wide contest there were 743 members with records kept up-to-date. The quality of the entries was of the very highest, the winning animals being fit for the strongest of competition.

It was an inspiration to see the 99 club members with their 107 animals in the arena at one time. Every club member was at the fair for a purpose—and will go back home with a larger conception of agriculture. Those who were responsible for interesting so many of Iowa's future farmers in good feeding and care of high class live stock have earned the gratitude of the state. They might well change the name of their work to a "keep the boy on the farm" movement. Similar contests with dairy calves would put enthusiasm into many a boy who would grow to be a successful dairy farmer.

Dairy cattle were in fewer numbers than usual, Guernseys alone exceeding their 1917 show. The quality was fully up to average, very few inferior animals making their appearance and the great percentage being as well fitted as in normal times.

Guernseys

Exhibitors: Island Farm, Minnesota; Dairyland Farm, W. W. Marsh, Mountain Bros., and J. A. Yoder, all of Iowa.

Judge: Hugh G. Van Pelt, Iowa.

Guernseys retrieved their reputation at Des Moines. They made the poorest show of the breeds there last year, and, this year, the best, with the largest number of exhibitors, more cattle, and a better general quality than any other breed.

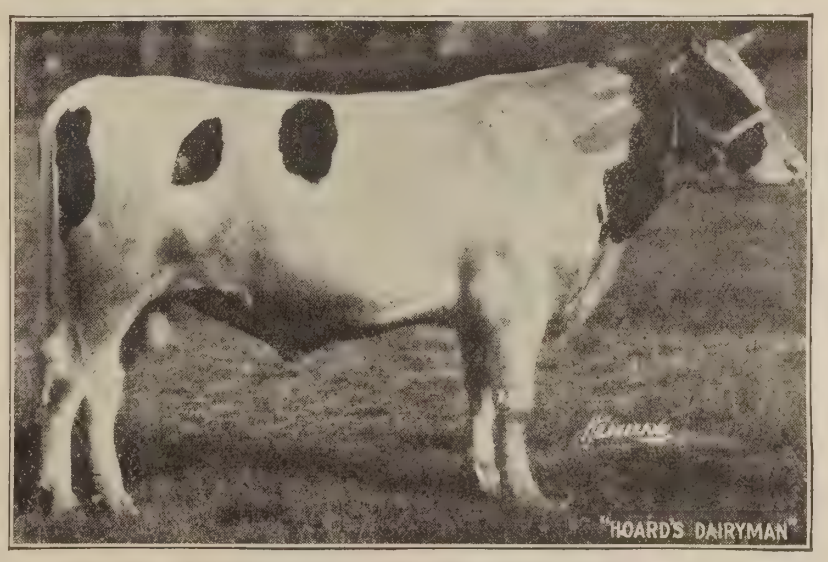
In a class of four aged bulls, Imp. Kenilworth Gold was selected to head the line. He is greatly improved over his 1917 form when he was first prize aged bull at the Dairy Cattle Congress and third at the National. He is splendidly fitted and is so well grown and filled out that he makes a much stronger showing than last year. His chief fault is lack of sufficient scale and spirit to carry him to the top against larger framed bulls of equal quality, though in his present condition he weighs around 1,600 lbs. Cherub's Winner, owned by Mountain Brothers, was placed first at Sedalia over Island Farm's Gold Lassie's Julian but went to fourth place at Des Moines, the Minnesota entry ranking next to the winner. The first four of the latter bull's heifers, with their first calves, are on test and producing at the rate of a 600-lb. average.

Senior and grand championship went to the Marsh bull, though he met two very worthy contendors after winning in the aged class, Imp. Kitchener's Express, winner in the two-year-old class and grand champion at Sedalia, from Mountain Bros. herd and, the junior champion, Cherub's Prince, a yearling shown by Marsh. The yearling is uncommonly large for his months and gives unusual promise of maturing into a bull of exceptional producing conformation.

Island Farm furnished the grand champion female, Imp. Bella 2d Du Grand Fort, an A. R. cow with a record of 595 lbs. fat, shown dry in the aged class. Her chief rival among the mature animals was Hayes Felois 4th, a 12-year-old with a record at 10 years of 635 lbs. fat, from the Marsh herd. The 12-year-old showed extreme dairy type in openness of framework and in udder and vein development. Her udder was broken in front, however, and she evidenced her age too strongly to be placed over the showy, strong, deep middled, strong backed cow from Minnesota.

The grand champion's daughter, Bella's Gold Lassie, won among the two-year-olds over Ingleside Pretoria Vrangue, owned by Marsh, in milk and showing splendid form, but without the growthiness, strength, and promise of the winner. When dam and daughter met for the senior championship the contest was close, the heifer showing every indication that her maturity will add a splendid individual to the Island Farm herd. Bopeep Queen 2d, a junior yearling, brought the junior championship ribbon to the Marsh herd, excelling Island Farm's senior calf and Dairyland Farm's junior, which in her class defeated a Marsh heifer whose dam and grandam have both won firsts at previous Des Moines fairs.

The list of awards follows:



Bull 3 years or over—1, Marsh on Imp. Kenilworth Gold; 2, Island Farm on Gold Lassie's Julian; 3, Dairyland Farm on Duke's Sheet Anchor; 4, Mountain Bros. on Cherub's Winner. Bull 2 years, under 3—1 Mountain on Imp. Kitchener's Express; 2, Dairyland on College Star's Dairyman of Tilly Bardin. Bull 1 year, under 2—1, Marsh on Cherub's Prince; 2, Rookwood Farm on Rookwood Cherub; 3, Island Farm on Maxim of Linda Vista; 4, Dairyland on Billy Bumps; 5, Mountain on Cherub's Glenwood of Iowanola. Senior bull calf—1 and 2, Marsh on Marie's Cherub of the Prairie and Lily du Preel's Prairie Gold; 3, Mountain on Cherub's Recollection of Iowanola; 4, Dairyland on Handsome Clyde; 5, Island Farm on Beda's May King of Island. Junior bull calf—1, Marsh on Alyssum's Cherub; 2, Dairyland on Marie's Fannie Sequel; 3, Island Farm on Princess Jewell of Island Farm.

Cow 4 years or over—1, Island Farm on Imp. Bella 2d Du Grand Fort; 2, Marsh on Hayes Felois 4th; 3 and 4, Dairyland Farm on Yeksa Margaret and Imp. Herival's Betty; 5, Mourtain on Martha W. of Alfalfa Farm. Cow 3 years, under 4—1, Dairyland on Belle Princess. Heifer 2 years, under 3—1 and 4, Island Farm on Bella's Gold Lassie and Bella's Golden Lassie; 2, Marsh on Ingleside Pretoria Vrangue; 3, Mountain on Pollyanna of Iowanola; 5, Yoder on Pocotello's Renivetta. Senior Yearling Heifer—1 and 2, Marsh on Imp. Prospect's Rose des Houards and Felois of the Prairie; 3, Dairyland on Bonny Boy's Beauty Eagle; 4 and 5, Island Farm on Gold Lassie's Beldame and May Rose of Island Farm. Junior Yearling Heifer—1 and 2, Marsh on Bopeep Queen 2d and Golden Cherry of the Prairie; 3 and 5, Mountain on Golden Queen of Iowanola and Gaby Rose; 4, Dairyland on Flossette of Grayside. Senior Heifer Calf—1, 4, 5, Island Farm on May King Beda of Island, Milvias Beda of Island Farm, and Beda Maid of Island Farm; 2, Mountain on Cherub's Lilly of Iowanola; 3, Marsh on Express of the Prairie. Junior Heifer Calf—1, Dairyland on Dairyland Fanny; 2, 3, 4, Marsh on My Figtree of the Prairie, Cherry's Good Luck, and Cherub's Grace Darling; 5, Mountain on Imogene of Iowanola.

Graded Herd—1, Marsh; 2, Island Farm; 3, Mountain Bros.; 4, Dairyland. Breeder's Young Herd—1, Marsh; 2, Island Farm; 3, Mountain. Breeder's Calf Herd—1, Marsh; 2, Mountain; 3, Island Farm; 4, Dairyland. Get of Sire—1, Marsh; 2 and 4, Island Farm; 3, Mountain; 5, Dairyland. Produce of Cow—1, Island Farm; 2, Marsh; 3, Mountain; 4, Dairyland.

Senior and Grand Champion Bull—Imp. Kenilworth Gold. Junior Champion Bull—Cherub's Prince.

Senior and Grand Champion Cow—Imp. Bella 2d du Grand Fort. Junior Champion Cow—Bopeep Queen 2d.

FAYNE BESSIE HOMESTEAD, SENIOR AND GRAND CHAMPION HOLSTEIN BULL AT THE IOWA STATE FAIR
OWNED BY CASS FARM CO., IOWA.

Ayrshires

Thus far on the circuit, Ayrshires have not been out in numbers. Sedalia had three herds; Springfield, two; and Des Moines but one. From the Sedalia show, the Seitz herd went to Columbus, Ohio, and Van Etta's to Kankakee, Illinois, leaving the third, that owned by C. H. Peverill, Iowa, to represent the Scottish cattle at the Iowa Fair.

Mr. Peverill has been a breeder of Ayrshires but a short time, building from a small beginning. The selection of his showing was limited to a herd of but 30 pure-breds. Considering this, the exhibit of fourteen head he placed in the ring was a notable success. J. G. Watson, Secretary-Treasurer for the Ayrshire Breeders' Association, placed the ribbons. Yankee Doodle was the only aged bull shown. While he is not of the choicest Ayrshire type and would not win in stiff competition, he has an unusual record as a breeding bull. Used largely with grades he has 150 calves, only three of which are pure-breds. It is remarkable that all but 14 of the 150 offspring are females. Among the 150 were 9 pairs of twins.

Rosebud's Pride, a junior calf, led the "under two" males and was awarded grand championship over the old sire.

Among the aged cows, Enid Lessnessock best pleased Judge Watson's ideas of Ayrshire type. Nona Spencer, the noted prize-winner of former years, lacked sufficient size and strength and balance of udder to warrant her outranking the aged entry, even though the latter was in thin condition. Bertha Carlton, senior calf, was made junior champion but yielded the premier honors to the mature cow.

Holsteins

Exhibitors: Cass Farm Co., J. H. Cleverley, Hargrove & Arnold, and Henderson & Erickson, all from Iowa.

Judge: H. H. Kildee, Iowa.

Four Iowa Holstein herds made up the show of black and whites. Cass Farm and Hargrove & Arnold won the bulk of the money, with Cleverley carrying off four firsts, and Henderson & Erickson attaching a blue with the only animal they exhibited. Cass Farm Co. was premier exhibitor and Hargrove & Arnold, premier breeder.

The 53 head were of full average quality but made a considerably reduced total, as compared with 1917's collection from eight herds.

Sir Ormsby Korndyke Mechthilde, Cleverley's aged sire, had the depth

Dairy Supplies or Equipment of Any Kind

We are manufacturers as well as dealers and we are therefore in a position to give the dairyman the very best value for his money considering the high quality of our goods.

The following are some items selected from our big Dairy Catalog. They are pieces of equipment which every dairyman can use to advantage and are sold under The Creamery Package Mfg. Company's guarantee of quality.

New Elgin pattern Milk Can, 10 Gal. size	$5.55
Duro Sanitary Milking pail with hood, 10 qt. size	1.60
Chapman Changeable Strainer	1.70
Jupiter Can Brush	1.75
Pail balancing scale 30-lb. capacity	2.85

Complete description of these and all other equipment in our catalog will be sent on request. Send your check for items you want and they will be shipped direct to you.

and development and breediness about the head to place him over Cass Farm's three-year-old bull, King Aaggie Hengerveld, a bull which will be much improved by bodying down as he becomes older. Fayne Bessie Homestead, a Cass Farm two-year-old just out of the class for yearlings, was a general favorite about the ringside. He has an extraordinary development of body—with a depth and length of middle and a width, length, and levelness of rump which is uncommon. His great scale for his age gave him a feminine appearance about the head which a year or two should remedy. He was popular as senior and grand champion. Cleverley's yearling was given the purple for excellence among the juniors. The Henderson & Erickson entry, Tritomia Pietertje Ormsby, easily led the senior calves, but was at a disadvantage in size and age in the championships and lost to the yearling.

At Sedalia the Cass Farm Co. came near drawing the same loss which befell the Seitz Ayrshire herd—the loss of their aged cow. Almeda Lueske Hengerveld, as it was, was reduced so much in flesh that it will be extremely difficult to get her back to normal weight by the end of the season. Her clean cut dairy form, greater depth of body, and spring of rib, together with an advantage in balance of udder, won her ranking over Hargrove & Arnold's Josephine Nudine Ormsby. The latter firm's only good chance for senior championship, and, later, grand championship, depended on the day, perhaps the hour, of freshening of Rose DeKol Wayne Butter Boy, a heifer which, beginning at 2 years, 2 months, produced 20,830.4 lbs. milk, 913.84 lbs. fat. She calved at 10 o'clock in the forenoon of show day and was shown, winning in her class but being too gaunt and feverish from parturition to establish herself in the championships. Professor Kildee found his junior champion in Rose King Mutual Wayne, the daughter of Rose DeKol Wayne Butter Boy, and, therefore, the heifer whose dam and sire's dam have the two highest yearly 2-year records. This heifer did not have the ringside favor accorded Cass Farm's junior calf, Aaggie Mona Clothilde, a showier, better topped contestant. The strength of body and general promise of productive ability of the older animal, however, made her pleasing to the eyes of dairy farmers.

The list of awards follows:

Bull 3 years or over—1, Cleverley on Sir Ormsby Korndyke Mechthilde; 2, Cass Farm Co. on King Aaggie Hengerveld. Bull 2 years, under 3—1, Cass on Fayne Bessie Homestead. Bull 1 year, under 2—1, Cleverley on Sir Pietertje Watson Homestead; 2, Hargrove & Arnold on King Mutual Josephine. Senior bull calf—1, Henderson & Erickson on Tritomia Pietertje Ormsby; 2 and 3, Hargrove & Arnold on King Mutual Erna and King Mutual Beauty; 4 and 5, Cass on Aaggie Hengerveld Segis and Aaggie Hengerveld Bismarck DeKol. Junior bull calf—1, Hargrove & Arnold on Tang Mutual Carlotta; 2 and 4, Cass on Aaggie Almeda Hengerveld and Aaggie Hengerveld Lilith Walker; 3 and 5, Cleverly on Fairlawn Colantha Ormsby and Fairlawn Burke Ormsby.

Cow 4 years or over—1, Cass on Almeda Lueske Hengerveld; 2 and 3, Hargrove & Arnold on Josephine Nudine Ormsby and Oak Dale Lady Clothilde; 4, Cleverley on Piebe Colantha Ormsby. Cow 3 years, under 4—1 and 2, Hargrove & Arnold on Rose DeKol Wayne Butter Boy and Kirby Hengerveld Inka DeKol; 3, Cass on Opal Segis Pontiac. Heifer 2 years, under 3—1 and 4, Cass on Mercedes Aaltje Johanna and Piebe DeKol Pride Homestead; 2, Hargrove & Arnold on North River Tidy Netherland; 3, Cleverley on Gudultje Pietertje Burke. Senior yearling heifer—1, Cleverley on Colantha Ormsby Homestead; 2 and 4, Cass on Alcartra Pink Johanna and Pauline Mechthilde Walker; 3, Hargrove & Arnold on Kirby Martha Girl. Junior yearling heifer—1 and 3, Hargrove & Arnold on Rose King Mutual Wayne and Rose King Mutual; 2, Cass on Pietertje Fayne Concordia; 4, Cleverley on Miss Piebe Pontiac Korndyke. Senior heifer calf—1, Cleverley on Fairlawn Ormsby Beauty; 2, 4, and 5, Cass on Aaggie Hengerveld Carlotta, Sadie Fobes Homestead, and Aaggie Hengerveld Daisy Homestead; 3, Hargrove & Arnold on King Mutual Korndyke Dulcie Jewel.

Junior heifer calf—1 and 5, Cass on Aaggie Mona Clothilde and Aaggie Hengerveld Canary Segis; 2, Cleverley on Fairlawn Ormsby Pontiac; 3 and 4, Hargrove & Arnold on Lady Mutual Vale and Miss Rose Mutual.

Graded Herd—1 and 3, Cass; 2, Cleverley. Breeder's Young Herd—1, Cass; 2, Hargrove & Arnold; 3, Cleverley. Breeder's Calf Herd—1, Hargrove & Arnold; 2, Cass; 3, Cleverley. Get of Sire—1, Cass; 2 and 4, Hargrove & Arnold; 3, Cleverley. Produce of Cow—1, 3, and 4, Hargrove & Arnold; 2 and 5, Cleverley. Premier Exhibitor—Cass. Premier Breeder—Hargrove & Arnold.

Senior and Grand Champion Bull—Fayne Bessie Homestead. Junior Champion Bull—Sir Pietertje Watson Homestead.

Senior and Grand Champion Cow—Almeda Lueske Hengerveld. Junior Champion Cow—Rose King Mutual Wayne.

Jerseys

Two southern Jersey herds, from Longview Farm, Missouri, and White City Jersey Farm, Oklahoma, exhibited 44 head and made a strictly high class showing for the breed, though nearly twice as many animals and three times as many breeders were entered last year.

Professor J. B. Fitch of Kansas served as judge.

In the aged bull class, Noble's Handsome Prince, a 9-year-old, put up a strong fight for the blue against Viola's Majesty's White Sox but finally was forced to second honors, a reversed decision from their placing by Professor C. H. Eckles at Sedalia.

The former bull was shown lacking and is beginning to evidence maturity of age. He did not have the spring of rib, style, and general indication of vigor the Longview bull brought into the ring but was a decided improvement in width and levelness of rump and clean cut thighs over the younger sire. The aged winner was made grand champion over Longview's Poet's White Heart, a highly acceptable two-year-old, and over Warder's Oxford Chieftain, a senior calf from the same herd which carried rank as junior champion.

Age was the deciding factor in the mature cow class. Two good ones headed the line-up. Oxford's Majesty's Crocus, a ten-year-old with a record of more than 500 lbs. fat, led to Fairy Glen's Flora, a young cow which has produced 595 lbs. fat a year, losing largely because of her age. The older animal was thin and seemed to lack the vigor of her competitor but was a cleaner cut dairy type, more attractive about the head, and with a superior level of rump. Her udder and veins were indicative of larger productive capacity, though the udder halves were divided alike. Either cow was a worthy winner, the greater number of years of service left to the younger cow, as shown by her strength, making her slightly favored. She was successful in her contention for grand championship.

In the younger female classes competition was close, there being frequent chance for the selection of very worthy animals from those turned down by Judge Fitch. These younger classes, especially, were of exceptional average quality and made noteworthy showings in the group. Raleigh's Oxtivity, Longview's junior yearling, was made junior champion.

The list of awards follows:

Bull 3 years or over—1 and 3, Longview Farm on Viola's Majesty's White Sox and Warder's Chieftain; 2, White City Jersey Farm on Noble's Handsome Prince. Bull 2 years, under 3—1 and 2, Longview on Pogis White Heart and Dorariscus Raleigh. Bull 1 year, under 2—1, White City on Tulsa Chief; 2 and 3, Longview on Emily's Poet and Count Raleigh. Senior bull calf—1 and 2, Longview on Warder's Oxford Chieftain and Raleigh's Bright Prince; 3, White City on Guenon's Handsome Prince. Junior bull calf—1 and 2, Longview on ———— and Norma's Perfect Raleigh; 3 and 4, White City on Eventide's Bell Boy and Pansy's Handsome Prince.

Cow 4 years or over—1 and 2, Longview on Fairy Glen's Flora and Oxford's Majesty's Crocus; 3, 4, and 5, White City on Zizi of Elmendorff, Oxford's Gamboge Queenie, and Fern's Precious Lass. Cow 3 years, under 4—1, Longview on Rower's Benedictine Girl. Heifer 2 years, under 3—1, 2, 3, Longview on Fontaine's Nema, Raleigh's Star of Peace, and Raleigh's Oxford Thistle; 4 and 5, White City on Distinction's Princess and You'll

ampion's Queen. Senior yearling heifer—nd 3, Longview on Fairy Feather and My ary; 2, White City on Egyptian's Fairy. nior yearling heifer—1, 2, 4, Longview on eigh's Oxtivity, Raleigh's Velvet, and eftain's Flora; 3, White City on You'll s Silverine Rose. Senior heifer calf—1, 2, Longview on Raleigh's Evening Star, jesty's Golden Plymouth, and Raleigh's Red ther; 4 and 5, White City on Catherine's vel and Majesty's Beautiful Star. Junior fer calf—1 and 3, Longview on Raleigh's ry Finance and Red Flag's Susan; 2, White y on Rosebud's Isis.
raded Herd—1, 2, 4, Longview; 3, White y Jersey Farm. Breeder's Young Herd—1 l 3. Longview; 2, White City. Breeder's f Herd—1, Longview; 2, White City. Get Sire—1, 2, 3, Longview; 4, White City. duce of Cow—1, 2, 3, 4, 5, Longview. mier Exhibitor and Breeder—Longview.
enior and Grand Champion Bull—Viola's jesty's White Sox. Junior Champion Bull Varder's Oxford Chieftain.
enior and Grand Champion Cow—Fairy n's Flora. Junior Champion Cow—leigh's Oxtivity.

Control of All Cheese

Regulations governing manufactur-s, dealers, brokers, and commission rchants in all kinds of cheese have st been issued by the Food Ad-nistration. They supplant the rules t out a short time ago on Ameri-n or Cheddar cheese and include e foreign types such as Round viss, Block Swiss, Brick, Limburg-, and Munster.

The margins that dealers may take er cost are the same for American Cheddar as previously fixed and finite margins have also been made r the leading foreign types. The ndamental principles of the rules plied to the handling of American Cheddar have been used in the con-ol of the foreign types.

All cheese must now be sold with-t regard to the market or replace-ent value at not more than a reason-le advance over cash. Cost may be eraged by weight of all cheese of e same type, shape, and grade ned at the time of sale. Licensees ust keep a record of the manner in hich the average cost has been de-rmined.

Cost shall include nothing more an the purchase price; transporta-on charges, if any, storage charges, tual insurance charges, and interest n money invested at the current te if the cheese has been in storage ore than sixty days; and the actual st of paraffining, if any, providing is not more than one-fourth cent a und. The cost shall not include any ovision for shrinkage, commissions, cking expenses, or other expenses it is intended that these shall be vered by the margins allowed.

A full report on costs and margins prices charged in any given period r any style of cheese, or any other cessary information, must be fur-ished by the licensee upon demand of e U. S. Food Administration or the ederal Food Administrator for the ate.

The margins specified are to be nsidered as maximum margins and re designed to be in excess of reason-le margins. They are purposely ade wide enough to take care of ecial cases where the cost of doing siness is exceptionally high. The dvances taken must never be enough give the dealer more than a reason-le profit.

Provisions are made restricting ansfers from branch houses, and les by one dealer to another at a rice higher than the buyer would ave to pay on the open market will be nsidered as collusion to defeat the urpose of the rules.

Since imports of foreign cheese ave been cut off from our markets y reason of the war, the demand for oreign types made in this country as increased greatly and competition etween dealers has been such as to esult in the buying of much cheese, specially Round Swiss, before it has een properly matured and, therefore, efore its quality could be determined. This has meant a highly speculative business with prices in accordance with the risk. It has also resulted in a noticeable lowering of the standard of quality of the cheese as it was removed from the factories and put into cold storage before being properly matured.

The rules now provide that the cost of any grade of cheese must be figured on the purchase price of that grade. When ungraded cheese is bought at a uniform price the dealer must not figure the purchase price of any part of it higher than the actual price per pound paid for the entire lot.

Clearly, if the dealer can not sell the portion of the ungraded cheese that develops into No. 1 at a higher price than the average cost plus the specified margin, the risk will be too great and the tendency will be to delay purchasing until grades can be determined and the standard of quality will be improved due to proper handling by the maker. Dealers realize that this provision in the rules will be a great benefit to the industry in meeting the after-the-war competition that is sure to come when the foreign cheese again enters our markets.

The maximum margins on American or Cheddar cheese are the same as made previously. They range from three-fourths cent a pound on carlots to three and one-half cents on sales less than 100 pounds, with graduated margins for intermediate amounts. On this kind, when held in a warehouse for more than thirty days, an additional margin of one-eighth cent per pound per month may be taken, but in no case shall such additions aggregate more than one cent a pound.

On Round or Tub Swiss the margins range from one and three-fourths cents on carlot sales to eight cents on cut-loaf sales less than 120 pounds. Additional margins are provided for cheese held in a warehouse more than thirty days.

In the case of all different varieties a higher margin is allowed on the smaller sales for the reason that the expense is much greater in handling and selling these small amounts. Much of the cheese disposed of in these small quantities is sold by the so-called "peddler" wholesaler from his wagon. The higher margins allowed to dealers selling the foreign types were decided upon because of the greater perishability of these kinds, the larger investment on account of the high price, the greater shrinkage due to the high moisture content, and the greater danger of spoiling.

Margins on Block Swiss begin with one cent a pound on carlot sales and increase to four and one-half cents on sales less than 150 pounds. Other margins are provided for cheese held over thirty days in a warehouse and for transfer to a branch house when the main house actually handles the cheese.

On Brick, Limburger, and Munster the maximum margins run from one and one-fourth cents on carlots to five cents on sales less than 130 pounds. Storage and transfer margins are provided for as in the case of the other varieties.

Manufacturers of any of these kinds of cheese who do the work of assembler, wholesaler, or jobber are subject to the rules governing men in those classifications. But instead of a purchase price as assembler, wholesaler, or jobber, he must either compute the cost of raw materials and the expense of manufacture or, in case of American or Cheddar cheese, take the price during the ten days after the cheese is manufactured on the established primary market on the basis of which this kind and grade of cheese is usually sold by manufacturers.

Definite commissions are specified

(Continued on page 242)

All separators are turned at wrong speed some of the time;

Some separators are turned at wrong speed most of the time;

But the Sharples Suction-feed Separator is *automatically* turned at the right speed *all of the time.*

Why take a chance?

Why not use the separator that is right all of the time no matter at what speed you turn?

Why not help save at least your part of that tremendous eighty-million pounds a year butterfat wastage that is a monument to carelessness in this country?

When you turn fixed-feed separators under speed you absolutely lose a percentage of cream. Bells and speedometers may remind you of this loss, but *an ounce of prevention is worth a pound of cure.*

With the Sharples Suction-feed Cream Separator there is no waste—the Sharples skims clean at *any* speed. No other separator does—its construction prevents. Only the Sharples has the suction-feed principle that draws the milk into the separating bowl in proper proportion to the speed in turning. Uniform separation—that's the Sharples way. Any other way is wasteful. No discs in the Sharples—that means easy, quick cleaning. More than a million users are saving with a Sharples. Write for catalog today; address Dept. 10.

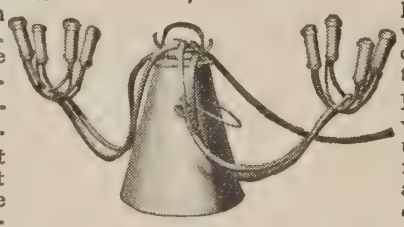
Buy Milking Machines As You'd Buy Stock

When you buy a pure-bred cow you are interested as much in her pedigree as in her butter-fat record.

Scrub cows sometimes establish a highly productive record for a limited time. But when you buy a pure-bred cow, her pedigree is your guarantee of uniform, heavy production year in, year out. You know you are taking no chances.



Buy milking machines the same way.

Investigate their past records. Find out what machines are standing up best under years of service. Inquire into their effect on the herd—milk production, lessened udder and teat trouble, effect on lactation period, etc. Also find out what machines the big milk producers and breeders use.

When measured by these standards, you'll be surprised at the overwhelming Empire leadership. You'll find them milking the foremost herds in the country, and you'll find them on the small dairy farms of 10 cows or more.

They're everywhere. Why?

Because the Empire works in harmony with the cow. The Empire Super-Simple Pulsator—the pulsator without a piston—causes a uniform action on teat cups.

Pistons wear and leak vacuum, resulting in uneven teat cup action, nervous, irritated cow and reduced milk flow.

The Empire Pistonless Pulsator cannot leak vacuum. The action is always regular and positive.

Cows like it. It soothes them and they let down their milk in increased quantities. Lactation period is increased. Teat and udder troubles diminish and the health of the herd is improved.

Investigate the Empire. Look into its "pedigree"—past performance. Get our 1918 Catalog No. 21. Let us have our dealer give you a demonstration. No obligation, of course.

The Dairyman's Real Problem

How to overcome Loss of Man Power and To Lower Cost of Production—To Keep Things Going at Home

After Our First Year at War, Necessity Has Produced Many Answers to These Problems, at the

National Dairy Show

COLUMBUS, OHIO, OCT. 10th to 19th, Inc.

You Can Learn What Has Been Done for You. There Will be Labor-Saving Devices—Machinery to Take the Place of Man Power—Improved Methods of Operating. The United States Government is Bringing to Your Show, Helpful Ideas and Suggestions.

To Win the War Must be Our One Great Thought, and the Government wants to Co-operate with You to this end.

The Show this year will be a real patriotic getting together of the whole Dairy Industry to work out its problems.

You can give and receive help by mingling with your fellows a few days at the Show.

Four Departments of Government are bringing to the Show, the meaning of our Industry to the people of the world.

The Greatest National Exhibit of Milk, Butter and Cheese Ever Assembled.

Creamery Men—Cheese Makers—Ice Cream Manufacturers—Cattle Breeders—Milk Dealers.

Dairy Farmers Will Hold Big Conventions

There is a duty and an opportunity in why you should not miss this Show this year. We must feed the world, and restock Europe with Dairy Cows.

Machinery Exhibits—Infant Welfare Demonstrations—Dairy Products Manufacturing Demonstrations—Home Economics School—Best Bred and Most Practical Cattle in the World.

Horse Show—Cattle Judging—Competitive:—Students' Products Judging—Bull Clubs—Calf Clubs. Cow Testing Associations—Lower Cost Feeds—Practical Farm Herds of Cattle.

Read your paper closely for stories of the valuable events to take place at this year's Show.

Farmers and Businessmen to Co-operate

HOARD'S DAIRYMAN:—Professor F. L. Musbach, in charge of the Branch State Experiment Station located at Marshfield, Wisconsin, has in co-operation with the Chamber of Commerce organized a movement to secure a closer spirit of co-operation between the farmers and business men of this section of the state. On July 30th and 31st, over seven hundred farmers from Wood and neighboring counties gathered at the farm where an educational program of addresses bearing on farm problems had been arranged for the instruction of the visitors. Among those who participated in the programs were C. P. Norgord, Professor F. B. Morrison, Miss Gladys Stillman, E. J. Delwiche, F. L. Musbach, B. D. Leith, Rev. F. J. Jordon, F. B. Lamson, and E. C. Pors.

The Tuesday delegation was made up entirely of farmers and business men from Taylor County who had been organized for the tour by R. A. Kolbe, agricultural agent for that county, and William Schmidt, secretary of the Medford Business Men's Association. The delegation was met in Marshfield by a committee of business men and a brief address of welcome was given by I. P. Tiffault. Lunch was served at the farm.

The leading address on Wednesday was given by C. P. Norgord, Commissioner of Agriculture. He emphasized the importance of this section of the state as one of the great dairy centers of the nation, and dwelt on the importance of raising well bred stock adapted to the needs of the farmer, and the necessity of securing stock free from contagious diseases. Among the diseases of a dangerous nature he spoke of tuberculosis and gave figures to show the alarming increase of this disease among cattle in the United States, and of the dire effects of this disease being spread among calves and pigs until it became a serious menace to human life.

FARMERS AND BUSINESSMEN GATHERING AT THE MARSHFIELD BRANCH EXPERIMENT STATION FARM

Among the problems discussed of special interest to the farmer was the importance of soil treatment and management, and the importance of securing varieties of grains adapted to the type of soil common to Wood and adjoining counties.

The ladies in attendance were deeply interested in the lecture and demonstrations relating to the canning of food products and the use of wheat substitutes which were ably treated by Miss Gladys Stillman of the Home Economics Department.

One of the most important features of the two days' gathering was the personal inspection tours made of the farm.

As a result of the Marshfield gatherings at the Experiment Farm, farmers and business men alike have been deeply impressed with the work done at the farm, and are realizing the great value of this Branch Station to the farming interests in this section of our state.

Wisconsin. F. B. LAMSON.

A rainy day job: Put tin around the feed bins where the rats are most likely to gnaw through. And plan a campaign against the rats.

To Improve Market for Minnesota Butter

A series of experiments, which it is hoped will result in great profit to the butter making industry of Minnesota, through what may be called a standardization of Minnesota creamery products, are being carried on this summer in the Dairy Division of the Department of Agriculture of the University of Minnesota.

The aim of these experiments is to improve the methods of butter manufacturing so as to combine in one product the keeping qualities of export butter, such as was first manufactured in Denmark, and the high flavor of America's butter.

If these qualities can be combined in one product, the products of Minnesota's creameries can be graded at a central station and shipped to markets outside of the state with the certainty that the butter will hold up to the grades certified. This will insure a better market for Minnesota's butter, and, it is felt, stimulate the dairy industry in a large degree, though Minnesota already produces more butter than any other state in the Union.

The experiments are being carried on by E. J. Holmers, state creamery inspector and dairy school instructor, and R. M. Washburn of the dairy division at University Farm. These two men have had more than a score of years of experience as expert buttermakers on top of years of farm experience. Yet they laughingly remark that they are just now learning to make butter.

The problem they have in hand is one of biochemistry, that of controlling the number of bacteria and enzymes in the butter.

Butter is produced under conditions that are practically identical and then placed in storage under the direction of federal experts. One sample is opened after 10 days, another after 30 days, another after 3 months, and another after 5 months. Each sample as opened is scored by state experts who are not informed as to the length of time the sample has been stored, or as to any of the conditions under which it was manufactured. In this way it is hoped an impartial judgment of the keeping and other qualities of the butter may be determined.

The experiments are in line with the ideas of a commission appointed by Gov. J. A. A. Burnquist to assist in improving conditions under which Minnesota's butter is marketed. Members of the commission are James Sorenson, chairman; H. Sandholt, secretary; R. M. Washburn and A. J. McGuire of University Farm, and Chris Heen, secretary of the Minnesota Dairymen's Association.—MINNESOTA COLLEGE OF AGRICULTURE.

Weeds result not only in big financial loss but also in great annoyance. Diseases, such as hay fever, could be eliminated almost entirely by adopting efficient methods for controlling the incidental weeds found along roadsides, in vacant fields, and in waste places.

Quality Cream for Quality Butter

The following advice comes from a communication to creamery managers written by W. B. Liverance of New York:

The recent spell of hot weather has brought to light at this end those creameries whose patrons do not attempt to produce a uniform high quality of cream. During the past two weeks creameries, which up until that time had been shipping a fairly uniform grade of butter, have sent shipments of uneven grade and of mediocre quality. The results have immediately shown up in the form of a financial loss. On the other hand, there are creameries whose patrons have co-operated in building up a reputation for high quality for the creamery. That the reputation is justified is shown by the fact that butter from such plants shows up fully as good during hot weather as under ideal dairy conditions, and, we might add, several such creameries are gathered cream plants. Financially, patrons of such creameries are well paid for the small extra trouble to which they have gone to produce milk and cream of high quality. During the very slackest of times in the butter markets of the country there is always a strong demand for high quality butter and the buyer is always glad to pay top quotation for such butter.

The writer knows from experience that creamery managers do very little to secure the co-operation of their patrons in an attempt to improve the quality of their butter. Too many look upon it as a hopeless task. That it is not hopeless has been demonstrated in many instances. It can not be done over night. It takes time and persistence. With the proper incentive many creameries have seemingly accomplished miracles in a month. In Iowa and Minnesota many creameries which were receiving practically nothing but sour cream were prevailed upon to make a contract with the Navy Department to supply it with a certain quantity of the highest quality butter. Many managers were inclined to have "cold feet" as soon as the contract was signed. However, practically all of them have been very successful in carrying out their contracts.

A Bull Warning

HOARD'S DAIRYMAN:—I have read so many warnings offered by you on the handling of bulls that I think it is my duty to give my own experience.

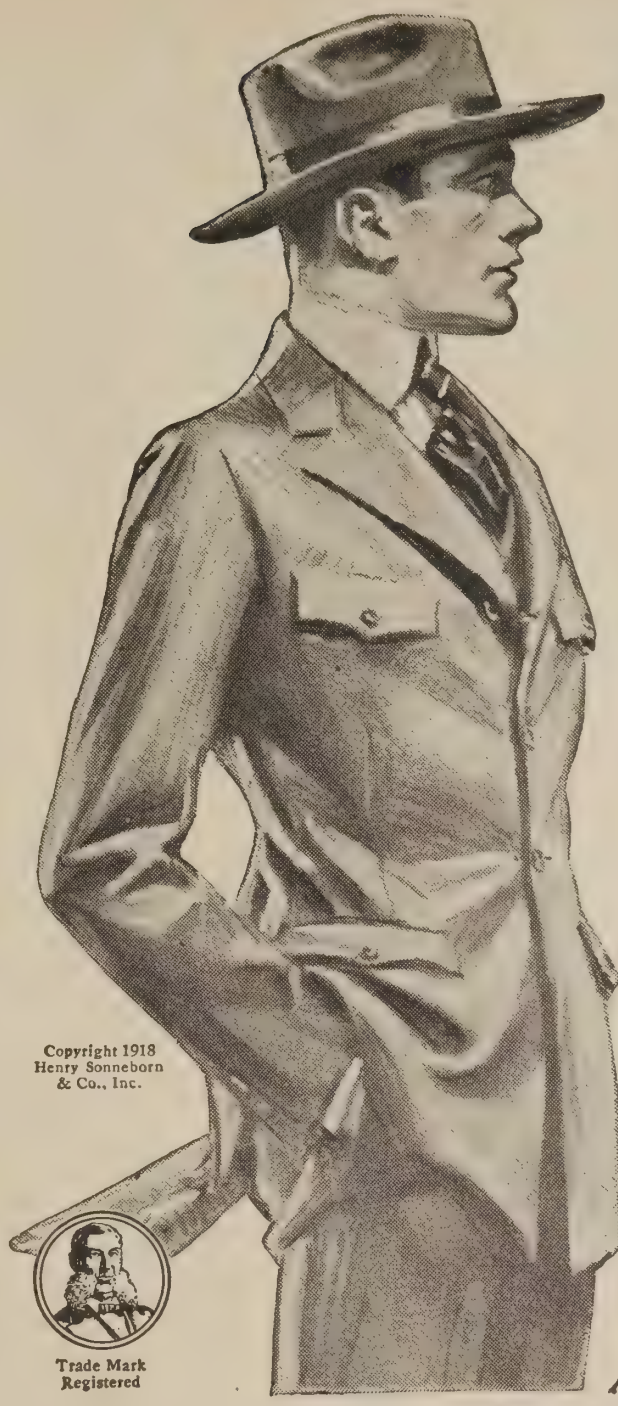
Not many years since, I was driving my eighteen-month-old bull to pasture across the railroad track. I opened the gate and then returned to drive the cows and the bull across the track. I rounded up the cows all right but before I could turn around for his majesty, he had me down and I could not get a chance to get on my feet. He rolled me over and over until he had me on the railroad track, then he jumped over me and rolled me back again. Sometimes he lifted me partly up and again pushed me with his muzzle, but in returning me he did not appear to try to put me back to the place where we started from. He rolled me up against the fence and I remember yet how I dreaded being crucified on a barbwire railway fence.

During all this time I did not lose my senses and kept watch carefully for the first opportunity that might present itself for escape. On reaching the fence, I put up both hands and got out of his reach and over the fence. The bull stopped for the first time, looked me over, threw up his tail and ran off. He broke only three ribs, but I felt the bruises and the nervous shock more than the breaking of the ribs.

The above experience (fortunately I am alive to tell it) causes me to be nervous when I see another person approach a bull. I have stood outside my yard gate and begged the hired man not to approach the bull unguarded and defenseless. I received the reply that he had told the bull to go in and he must mind. My reply was, "But you must not forget it is a bull you are dealing with."

I always treat a bull kindly but in some way see that he complies with my commands. I lead the bull and don't want the bull to lead me. I am always prepared for a surprise and on my guard that he does not take me unawares. In leading a bull with a staff, I never go ahead of him. I have found he is more easily controlled if I walk at his side and opposite his shoulders.

Kansasville, Wis. M. O. C.



Cort to Minnesota

Joe C. Cort, lately extension agent for the Holstein-Friesian Association of America, and formerly in charge of dairy extension for the Iowa State College, has been appointed Assistant Professor of Dairy Husbandry in the Minnesota College of Agriculture. He will engage in the production side of the instructional and investigational work.

Mr. Cort's work with cow testing associations in Iowa and the beginning made in the publicity movement for Holsteins fits him well for practical results in the class room. Extension workers will regret his leaving field activities.

The nation's standard in clothes of moderate price

Styleplus are the only clothes in America identified each season at nationlly known prices.

Each Styleplus grade is one price the nation over.

We center our volume on a few grades—cut down the expense of manufacturing—this is the reason behind the famous Styleplus quality.

No matter where,—no matter when—you buy Styleplus Clothes you *know* they are right in style, in wear, and in price.

Go to the Styleplus Store and see for yourself. Try on the clothes. Get exactly the kind that suits your build and your taste—that fit right and look well.

When you see your clothes before you buy them you know what you are getting. Buy Styleplus and you will always be sure of the big value at a moderate price.

Two grades in Styleplus suits: $25 and $30.

Three grades in Styleplus overcoats: $25, $30 and $35.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AG) for Styleplus booklet and name of local dealer.

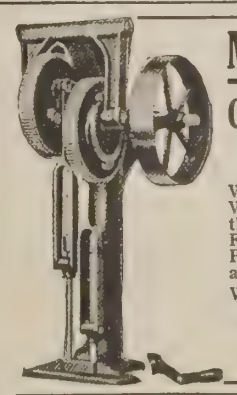
BURRELL  MILKERS

The B-L-K Milking Machine will solve your labor troubles. Write for free booklet and information.



We handle a full line of supplies for the Dairy and Dairy Farmer. Highest grade goods at lowest prices. Prompt shipments.

N. A. Kennedy Supply Co., Kansas City, Mo.

Cow Waters Herself

You must read about the new LIBBEY AUTOMATIC WATER BOWL for cows and horses—a wonderful improvement in barn watering. No float tank needed. Every bowl is automatic—controls its own water supply; can be placed any height and in any stall or pen. Most sanitary bowl sold. PREVENTS SPREAD OF CONTAGIOUS DISEASES. Increased milk yield quickly pays cost. Saves labor, saves feed. Write today. Also for Catalogue No. 9, if interested in stanchions, stalls, carriers, etc. Sent free.
C. A. LIBBEY CO., 195 Marion St., Oshkosh, Wis.

More Water?

Chippewa Steady Stream Pump

Will Produce More Water with less Power than any other Pump. For Farms, Ranches, Pressure Systems and all other purposes.

New York Butter Market

NEW YORK CITY, September 3:—During the past week the market has been exceptionally strong. At the outset last week the seasonal decrease in make was beginning to make itself felt and there was an increase in price as a result. However, on Thursday all receivers and handlers of storage butter received instructions from the Federal Food Administration requesting them to reserve 60% of all grades held in storage August 1, for government use. The order had the immediate effect of further strengthening the market and its influence is yet very apparent. As a result all grades of butter advanced a half cent in price. On Friday the quotation was further advanced a half cent and today the quotation is again a half cent higher. Indications point to still further advances in price and a quotation of 50c for extras is expected before the close of the week. At the close today quotations were as follows: Extras (92 score butter), 48½c; Higher scoring than extras (93 score or higher), 49@49½c; Firsts (88 to 91 score), 46@48c; and Seconds (83 to 87 score), 43½@45½c. There is as yet a great scarcity of unsalted butter and it is quoted at a differential of one and a half cents above corresponding grades of salted butter.

It is very interesting to note that our armies which up until a short time ago were receiving considerable quantities of oleomargarine in place of butter are receiving at present larger quantities of butter. That fact is interesting from a butter marketing standpoint as it naturally will have an important bearing on the stability of the market during the present year, if not for the duration of the war. This year promises to be a banner one for the creamery industry and farmers who patronize the home creamery will find themselves well repaid because of their loyalty to the local institution. There is a world of promise in future export trade in butter as there will be a strong demand from the war infested countries for dairy products to serve as up-builders of the peoples whose vitality has been so seriously impaired because of the hardships which they have experienced. High quality butter will be in strong demand and it is very important that farmers co-operate to the limit with their creameries in order that a butter may be produced that will be demanded from across the seas. W. B. LIVERANCE.

Hay Prices

It is evident that the price of all hays will range high the coming winter. Quotations received from Kansas City on hay delivered at the buyer's railroad station are as follows: No. 1 alfalfa per ton, $36.25; standard alfalfa, $34.75; No. 2 alfalfa, $29.25; No. 1 upland, prairie, $29.75; No. 2, $28.75; No. 1 timothy, $32.50; No. 2, $30.50. These are August prices. It can hardly be expected that they will decrease as the season advances.

A Correction

In our report of the New England Ayrshire Club sale published June 28, Willowmoor Peter Pan 92nd was listed as having been purchased by E. E. Sawyer of New Hampshire, which was a mistake. W. H. Druckemiller, owner of Crestmont Farm, Pennsylvania, was the purchaser.

First Meeting Wisconsin Dairy Council

THE first meeting of the Wisconsin Dairy Council was held at Madison August 31st in the office of C. P. Norgord, Commissioner of Agriculture. Ten of the nineteen persons suggested for members of the Board of Directors by the representatives of the dairy and agricultural organizations of the state who met in Milwaukee on August 7th were present. Several others interested in the welfare of dairying in Wisconsin were also in attendance. The meeting was called to order by A. J. Glover, chairman of the meeting held in Milwaukee.

Mr. James Clemens made the suggestion that the Board of Directors be enlarged so that the State Grange, Society of Equity, Milk Producers' Association, and the Cheese Federation could have representatives upon the board. A resolution was offered and adopted enlarging the board from 19 to 27. The meeting then proceeded to formally elect the following members as representatives of the various organizations, they to serve as the Board of Directors: Milk Producers: Howard H. Greene, G. R. Rice, J. H. Kelly, W. C. Brill; Purebred Dairy Cattle: Fred Pabst; Butter Manufacturers: Guy Speirs; Cheese Manufacturers; C. E. Reid; Condensed Milk Manufacturers: J. H. Harris; Manufacturers of Dairy and Barn Equipment: W. D. James; Dealer in Dairy Products: George C. Mansfield; Milk Distributors: John LeFeber; College of Agriculture: H. L. Russell; Dairy and Food Commission: C. E. Lee; State Department of Agriculture: C. P. Norgord; Public Instruction: C. P. Cary; Dairy Press: A. J. Glover; Consumers: Mrs. Edith Hoyt; Wisconsin State Grange: A. L. King; Wisconsin Cheesemakers' Association: J. L. Sammis; Wisconsin Buttermakers' Association; G. H. Benkendorf; Society of Equity; James Clemens; Cheese Producers' Federation; Henry Krumrey; Members at Large: George Buckstaff, Dr. G. A. Kletsch.

It is the purpose of the Wisconsin Dairy Council to have each of the several dairy and agricultural organizations at their regular meeting select two persons from whom the members of the Council may elect one to serve upon the Board of Directors to represent the organization from which he was selected. In other words, each dairy and agricultural organization shall have a representative upon the Board of Directors of the Council and members shall be selected by the organization which is represented.

After the Board of Directors were elected, the meeting of the members of the Council adjourned and the directors' meeting was called. This body selected for officers for the ensuing year the following: President, A. J. Glover, Fort Atkinson; vice-president, G. R. Rice, Milwaukee; secretary-treasurer, John LeFeber, Milwaukee.

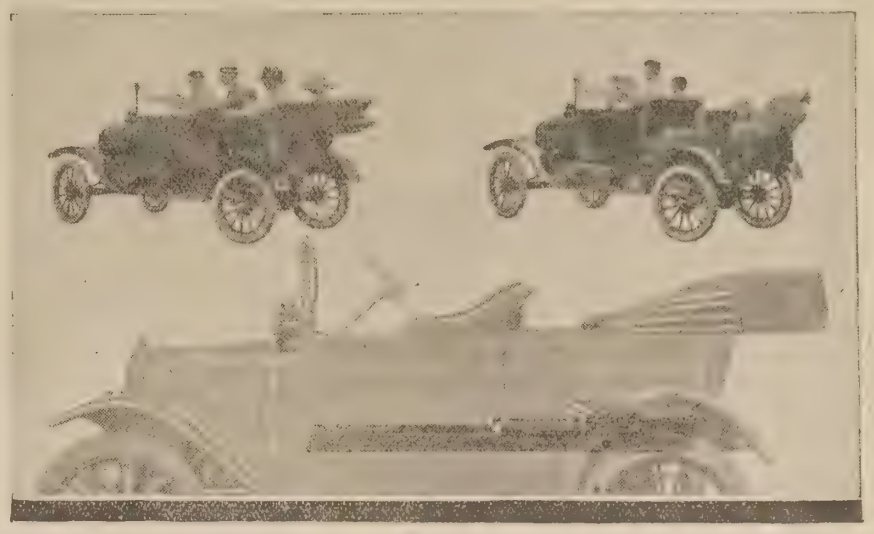
This body then discussed the policy of the Council and plans for educating the consumer regarding the importance and food value of milk and its products. Mrs. Edith Hoyt, chairman of the Child's Welfare Committee of the State Council of Defense, stated it was particularly important that mothers should be advised of the necessity and value of milk for young children. In her child welfare work she has found young children fed on sauerkraut, beer, and coffee, and that milk forms but little or no part of their diet. Children fed in this way are low in vitality and do not develop properly. She urged the establishment of milk stations, especially in the larger cities, where pasteurized milk might be sold to the poorer classes at lower prices than when milk is delivered. She also believed there was opportunity to co-operate with the health departments of the municipalities and in this way reach the mothers who do not read and have not yet learned of the food value of milk for growing children.

Dean Russell of the College of Agriculture informed the board that the Wisconsin College of Agriculture had under way a poster discussing the food value and the necessity of milk, which they expected to place in every schoolhouse in Wisconsin. He believed that if every mother could be led to tabulate the weight of her child that it would do much to interest her in its diet. He believed, also, that it was necessary to educate the doctors of the state regarding the nutritive value of dairy products and that the city press must be advised concerning the importance of milk. It has been very noticeable that whenever the price of milk has advanced, the city press has raised objections, notwithstanding milk is the cheapest animal food now on the market.

Owing to the large demand for butter, cheese, and condensed milk, it did not seem to the Board of Directors that it was necessary to do anything to stimulate the consumption of these products. The government recently commandeered 60% of all the butter in cold storage and the demand for condensed milk is far beyond the supply. There is less cheese now in cold storage than a year ago and the prices are higher and the demand is increasing.

It did seem though that it was important to advise mothers of growing children regarding the necessity of milk and to encourage a larger consumption of skimmilk and its products. Many millions of pounds of skimmilk are being fed to swine that could be well diverted and used as human food without converting it into pork. The splendid campaign for increased production and consumption of cottage cheese now being carried on by the Dairy Division of the U. S. Department of Agriculture is bringing a larger amount of skimmilk into use as human food.

It was decided that some effort should be made at the Wisconsin State Fair to inform the dairy industry regarding the purpose and object of the Wisconsin Dairy Council and to call the attention of the consumer to the value of milk as a food and its relative value as compared to other foods.



The board decided that one of the most effective ways to bring the consumer's attention to the value and importance of milk was through the school system. The president was directed to appoint a committee whose duty it would be to formulate a plan for getting such information in the hands of every teacher in the state and to provide suitable matter regarding milk and its products. There are a few schools already doing some work to determine the effect of the consumption of milk upon the physical and mental development of the child and the Council desires to lead every school to take up the same kind of work. It was also decided to cooperate with the State Council of Defense, the Child's Welfare Committee, and the county councils of defense in a campaign to educate every home regarding the food value of milk and skimmilk and its products.

The president was also directed to appoint a financial committee. An association of this character must be provided with funds or it cannot hope to accomplish much. It is the purpose of this organization to secure funds from the producer, the distributor of dairy products, the manufacturers of cheese, butter, condensed milk, and dairy machinery and barn equipment companies and from every one interested in the development of the dairy industry.. At this meeting about $300 was pledged for work in the month of September. It is to be hoped this will be increased when others are advised of the purpose and object of the Wisconsin Dairy Council. The Board of Directors expects to hold another meeting in October or November for the purpose of laying further plans for increasing the consumption of milk and its products.

It is not the purpose of the Wisconson Dairy Council to absorb any of the activities of the dairy and agricultural organizations already in existence, and which have done splendid work in their respective endeavors. The Wisconsin Dairymen's Association, the oldest of our organizations, is devoting its energy to the increased and more economical production of dairy products; the Cheesemakers' and Buttermakers' Associations are endeavoring to improve the workmanship of their members and to improve the quality of butter and cheese. Then, we have breeders' associations organized for the purpose of assisting them in advancing our several breeds of dairy cattle. There are also marketing associations and various other organizations which are engaged in special fields for the purpose of advancing the dairy and agricul-

(Continued on page 231)

TWO CAR SERVICE at ONE CAR COST

The Heath-DUPLEX patented folding truck body for Ford touring cars will pay for itself quicker than any machinery investment you ever made.

It is attached securely to the chassis. It fits old or new Fords.

The Heath-DUPLEX delivery body stays out of sight under the tonneau, with no outward sign of its truck utility, when the Ford is used as a touring car. The tonneau of the Ford touring car is made removable.

To make it a truck you simply slide off the tonneau and unfold the delivery body. Sixty seconds is all it takes. No tools are necessary.

To return it to a passenger car you fold up the delivery body and slide on tonneau. Another minute accomplishes this change.

Many a farmer will save the price of his Heath-DUPLEX this season by his ability to haul men and supplies in time to salvage a crop from disaster by storm or frost. On the average farm it will pay for itself in a month's use.

The Heath-DUPLEX is a product of the same spirit that moves a farmer to grow twice as many bushels to the acre as he did before the war.

It adds truck use to touring car use at a small cost, utilizing the low cost operation of the Ford for a double purpose.

It is indispensable to the small farmer who can't afford a separate truck. It is equally essential to the big farmer because of its ability to haul the lighter loads at less expense than his heavy truck.

One demonstration of the Heath-DUPLEX will convince you beyond further question as to its utility. Write us for folder explaining clearly the Heath-DUPLEX. We will also tell you where you can get a demonstration.

Look for a demonstration of the Heath-DUPLEX at your state fair.

EDITORIAL COMMENT

COMMON COURTESY

Quite frequently we receive complaint that those who advertise for hired help, and as well the hired man who advertises for a position, will neglect to answer the letters that the advertisement brings them. This may be generally a thoughtless discourtesy but it is none the less reprehensible. It may be a little trouble to buy some postal cards and notify those who have written you that you have secured your man or have secured your position but any one unwilling to do this should not advertise. It is just ordinary and common courtesy that one has no business to intentionally neglect. It comes usually from the thought that the answer is of little consequence, having secured what was wanted, but those who have written in response to the advertisement do not know the position is filled or that the man has secured his position and the neglect causes needless annoyance. Neglect of this kind is unbusinesslike and discourteous. "Do unto others as you would be done by."

FACTS CONCERNING BACTERIA

In a recent address by Dr. Jacob G. Lipman, dean of the New Jersey Experiment Station, the following facts are given in regard to the knowledge we now possess regarding bacteria:

"Anton Van Lleuernheuk, a Dutch lens grinder of the 17th century, was the first to discover bacteria. In 1887 Pasteur discovered that decay was due to living organisms; in 1877 two Frenchmen experimented on nitrification and the relation of living organisms to crop production, and in 1883 the Americans, Atwater and Wood, showed why legumes increased the productivity of the soil but failed to discover their exact connection with bacteria. For more than 4,000 years the Chinese farmer has known of the application of legumes and compost and of their value in treating the soil so as to stimulate production."

KEEPING THE ADVERTISING COLUMNS CLEAN

Every reputable agricultural journal and, for that matter, every wise and honest newspaper as well, has to be constantly on guard against being misled by its own desire for financial gain to the sacrifice of its usefulness to its readers. The way to this accomplishment lies through the counting room in the form of artful advertisements that are not intended for the public good.

A writer in the Atlantic Monthly tells how the German press was debauched, and the German people most terribly misled during the war by the firm of Krupps with their advertisements for which they paid the highest rates. They used all kinds of papers to effect this debauchment of the German press and people, even to the humblest bee journal.

The first thought of every right thinking editor and manager of a paper should be to deal honestly with his readers and see that they are not misled and deceived to their hurt by dishonest and untruthful advertisements. Hoard's Dairyman refuses thousands of dollars' worth of advertising every year because we doubt its honesty and truthfulness. We lay no claim to any credit for this. It is a solemn duty we owe to our subscribers who pay for what they hope and suppose to be a reliable, honest journal.

A WEEK OF THANKS AND PREPARATION

Our government has already under way plans to increase the production of food for next year. In sections that grow winter wheat attempt is being made to increase the acreage. But the big drive for an increased food production for next year may be held during the week of Thanksgiving.

The feasibility of devoting this time to the purpose of a larger food supply has been discussed favorably by the Agricultural Advisory Committee of the Wisconsin State Council of Defense.

This is a very appropriate time to discuss ways and means of increasing food production for 1919. It will be a week of profound gratitude to Him who has dealt so generously with us. In offering our thanks for the bounteous harvest we shall show wisdom in providing plans to do our part to provide for a still larger crop next year. The shortage of farm labor and the extra burdens laid upon the farmer call for higher efficiency in farm work than ever before. It not only means that the farmer must make every movement count, but he must treat his soil so that it will do its best. Good management everywhere in the field, in the barn, and in co-operation with neighbors must prevail. Machinery and equipment must be purchased with the view of saving labor.

Considering plans for increasing crop production for 1919, during the week of Thanksgiving, is both fitting and wise as it will give the farmer opportunity to consider them during the winter and provide means for carrying them out.

ROCK PHOSPHATE AND WHEAT

For some years there has been more or less contention regarding the value of raw rock phosphate and acid phosphate as a fertilizer to increase the phosphorus content of the soil. The advocates of raw rock phosphate hold that it is the cheapest and best way to secure phosphorus for building a permanent system of agriculture. Their method of application is to apply it with barnyard manure or plow it under with some green crop, preferably clover or alfalfa. This is done for the purpose of associating it with the raw rock phosphate, which contains phosphorus in the unavailable form, that it may be converted into a form which may be taken up by the plants. Raw rock phosphate does not bring the quick returns that the acid phosphate form does, but the large yields of wheat secured this year by farmers in Illinois who have used the raw rock phosphate demonstrate clearly its value. It may be said that those desiring immediate returns from an application of phosphatic fertilizer should use acid phosphate; in other words, the form of fertilizer which has phosphorus in the available form.

This coming year it is highly desirable to increase the production of wheat and for this purpose acid phosphate should be used rather than raw rock phosphate. It seems both forms of phosphorus have their places and farmers who desire to increase their crop production may well consider the use of phosphorus in some form. In the dairy sections where clover, alfalfa, and barnyard manure are used for increasing fertility, the land is likely to become too rich in nitrogen and lack in the element phosphorus, which is very necessary for the development of plump grain and to strengthen the straw that it will not lodge easily.

MILK AS A FOOD

We desire to call attention to the splendid article by Ernest Kelly of the Dairy Division on the front page of this issue. It is an unusually well balanced article, and sets forth clearly the reasons why effort should be made to inform the people concerning the importance and food value of milk and its products.

As we note the amount of milk consumed per capita, we are led to believe that there are but few people who appreciate its food value. More than four years ago we began to publish articles concerning the splendid work done by McCollum and Hart at the Wisconsin College of Agriculture, and about three years ago Dr. McCollum wrote us a series of articles which showed up clearly that milk is essential to the proper development of the human race. It is our duty to carry this message to every home. Not only does the farm home need to be advised concerning the splendid food value of milk and its products, but also the city home and especially those whose incomes do not permit them to be extravagant in their purchases of food. The war has called attention, as nothing else could, to the necessity of buying food according to its nutritive value. The American people have been supplied so generously with foods and they have been so cheap that most of the purchases have been made according to taste with little regard as to nourishing properties. A few people realize that milk is the most economical animal food and one of the most nourishing foods, but the number is so small that there is necessity of carrying this information through various channels to every household in our country.

In our little city where the people have been advised many times through the local papers concerning the importance of milk, we found this year a young boy working on Hoard's Dairyman Farm whose breakfast consisted of bread and syrup and coffee. He was a plucky little chap, but observation revealed that he was under-nourished and not capable of doing as much work as the other boys with whom he was associating. We learned through him that his folks thought milk was too high in price and they were not purchasing any. They did not know that meat was far more expensive and not nearly as good for a growing boy as milk. In the short time that he worked on Hoard's Dairyman Farm he was given all the milk that he could drink and we could see an improvement in his physical condition.

If parents are not in position to buy an adequate supply of whole milk, they should at least purchase a liberal amount of skimmilk. It is a splendid food for growing children, but how common it is to hear people speak of skimmilk in a jesting way. They do not know that 100 lbs. of skimmilk contains as much nourishment as 15 or 16 lbs. of beef. For the welfare of the nation it is the duty of dairymen to carry the message of the value of milk and its products to all the homes in our nation.

THE SPIRIT OF THE SOLDIER

We have never under-estimated the spirit of farm boys to serve their country in time of war. No class of people responds more quickly to their country's call than the farm boys. It has, of course, been hard for the farmers to give up their sons to serve Uncle Sam, but we know very few farmers whose sons have enlisted would care to call them back. They need them badly in their farm work; they need them for the source of pleasure and the comfort they bring to the home; but these men have risen above their selfish interest and are willingly making the sacrifice necessary to bring victory to this nation.

The spirit and object of the soldier is well expressed in the following letter recently written Wallaces' Farmer:

"The company in which I am is composed of Iowa boys almost exclusively, and of course that means they are mostly farmers. I have talked with a good many new men since I came into the service, and you may be interested in knowing how we all look at this whole affair. I have found very few who would be glad to go home, even if they could. We all want to get our training and get across as soon as possible. We are very confident that we can do our work in a manner that will be an honor to our country, to our home state, and to our community. The general sentiment of the boys here is that the folks at home must do their part well, and leave it to us to determine when peace shall be made. We are willing to stake our fortunes, our lives, and everything we have, and we want peace to come only when the war is won. We do not say 'when the war is over'. If the folks at home will refuse to listen to German peace propaganda, we will promise them we will never want to come back until Belgium is restored, Russia is delivered, and peace terms decided upon which will settle the vital issues of this war for the future."

This soldier farm boy reveals the spirit which animates those called upon to serve their country in foreign lands. May this spirit permeate every home because it is just as essential for those who remain here to be steeled to the job of winning the war as it is for those who are actively engaged in it.

WRITE TO THE SOLDIERS

We had the good fortune to hear a French soldier, who had served nearly four years at the front. He told of several battles in which he had engaged, of the spirit of the soldiers and their determination to win victory for freedom. He said there was no question about the outcome of the war and that the soldier would do his part willingly and well. But certain duties fall upon all of us back home, and one thing he emphasized was writing letters regularly to the boys in the army and navy. He said there was not an hour in the day that the soldier was not thinking of home, wondering what his loved ones were doing and whether they were thinking of him. Letters haven't come to the soldiers over the seas as regularly as they should. They crave news from home. When a soldier goes to the post office for his mail and finds no letter it makes him feel despondent and depressed. This speaker urged that a few words be written each day; that is, start a letter on a certain date and write a few lines or paragraphs; then continue it the next day and so on, but put in the date each time. This will let the soldier know he has been thought of every day, the greatest encouragement he can receive.

We know how busy all the folks are on the farm and that letter writing is not the easiest task for people engaged in manual work, but if plans are made to pen a few lines every day to the boy who is away from home, telling him in brief what has been done on the farm that day, it will do much to lighten his heavy burdens. He would like to know about the crops raised, what the yield is per acre,

when his choice cows come fresh, how their calves are growing, when his younger brothers and sisters start to school, what they are doing in school, and all the little details which seem unimportant to those acquainted with them. These are all important and cherished information to him. It would be our suggestion to send letters at least twice a week, but write him a few lines each day and let him know that he has not been forgotten back home.

Drain for Silo—Moldy Silage

Some years ago I built a silo 12x22. Every season, rather earlier than this date, I have it freshly creosoted inside, after thoroughly cleaning it. It is all above ground on a solid stone and cement foundation. Should there be an opening for drainage near or at the base? If so, how large?

Last year the corn was put in early in September, the corn almost glazing, the leafage bright green, the stalks full of juice. It was cut into half-inch lengths and well trodden. There was not a sufficient quantity to quite fill it. When we began using it, some weeks later, it smelled as sweet as a clover field, but very soon it began molding and grew worse and worse so that we had to discard more than fifty per cent of it—a serious loss. We fed six cows from it, and used up daily about two inches. Some of the mold was pinkish and some greenish, and it was pretty evenly scattered over the surface. The corn was so juicy when it was put in that no water was put in and the silage was juicy all the way. Can you tell me what was the matter? Should it have been salted? Is green mold or pink mold worse? Should the corn have been riper?

Lancaster, Mass. A. H. W.

There is no necessity of providing drainage at the bottom of the silo, except possibly where very green corn is ensiled or where the silo has no roof and is open to the weather. However, silos are occasionally equipped with this form of drainage, the outlet being placed in the center of the silo bottom and tile laid so as to have an outlet some distance away. The outlet should be covered with heavy screen wire so that animals will not enter it and there should also be a trap of some kind that will form a water seal to keep the air from entering at the bottom of the silo.

We are unable to explain the spoilage of the silage, except that possibly it may not be fed off in sufficient quantity each day, or else care is not being exercised that the silage is not loosened to a greater depth than is needed for each day's feed. Where only a few cows are fed, it may be necessary to adopt some such procedure as is suggested on page 107 of our issue for August 16th.

We note that there was fed at least two inches daily. However, according to our computations, if the silo was filled to a settled depth of 16 ft., it would have contained approximately 55,000 lbs. of silage. The weight per inch of the silage would, of course, be greatest at the bottom, but the average per inch for the 16 feet would be 287 lbs. This would provide six cows with 48 lbs. each, or two inches would provide six cows with 95 lbs. of silage each. If two inches were taken from the surface daily, it would appear that there must have been a considerable quantity of spoiled silage, as average sized cows will ordinarily make profitable use of not over 30 to 40 lbs. of silage daily.

A round silo that is practically air-tight and which has been filled with corn cut in ½ inch lengths and the cut corn properly packed, should preserve this ensiled material with very little loss. It is, of course, preferable that a silo be filled to a distance somewhat greater than 16 feet, as then its own weight tends to insure a better packing of the cut material. Salting will not overcome the molding of silage and the ripeness of the corn within reasonable limits will not have any detrimental effects. The general rule now is to ensile the corn in a somewhat more ripened condition, using water where the stalks and leaves may have become somewhat too dry to pack properly. Where it is practical to do so, corn may be ensiled for the silo about a week or ten days prior to the time it would be ready to cut and put into shocks. In this condition it will seldom need additional water in order to insure proper packing.

We recognize no difference in the undesirability of pink and green mold in silage. Care should be exercised that the moldy or spoilt material is not fed, at least the major portion should be removed. However, it is somewhat remarkable that well fed cows will ordinarily separate the spoiled material from the good and only eat the latter. Horses and calves, however, should never be fed silage containing any mold. There has been practically no scientific investigation as to the formation of different kinds of molds in silage. The important things are an air-tight silo, with the silage sufficiently moist to pack well and exclude air. Practically all molds require the presence of air to grow, so the principal control measure is to exclude all air possible.

Starting With Pure-breds

I have a herd of twenty grade Holstein cows. Our market is for whole milk. I have decided that it does not pay under existing conditions to keep any cow that is not able to make 10,000 lbs. or more of milk per year, also I want nothing but tuberculin tested cattle. In view of this I have decided to sell my herd and buy a fewer number of strictly first class three- or four-year-old Holstein cattle, either grade or pure-bred. That's where I want your advice—which to buy, grade or pure-bred? I am a young man, married, have bought a farm, the payment on which is $700 per year, 120 acres; 65 acres tillable, of good clay loam soil. I have never had any trouble with my cows in any way because I have fed and handled them carefully. I feel that to keep cows in first class shape you can't be too careful in the feeding. I should probably have about $2,000 to put into a new dairy. This will buy about twelve first class, young grade Holsteins that will make 10,000 or 12,000 lbs. a year. What would you advise, grade or pure-bred, and why? I will buy no animal over five years old. I can get about 8 cents per gallon more for milk from tuberculin tested cows.

Ohio. H. A. N.

Whether a man will be successful with pure-bred dairy cattle depends all together upon himself. There are many men who are what may be called "pure-bred" farmers. They enjoy spending a great deal of time with their cattle and in giving considerable attention to the matter of sales and to the study of pedigrees. They are frequently more successful as breeders than as care-takers of a high-producing herd. On the other hand, we know a very good number of splendid dairy farmers who are securing highly profitable returns from grade herds who would not make a success of the pure-bred business. The matter depends altogether upon the individual.

There has never been a more favorable time for making a start with pure-bred dairy cattle than the present. The future gives very large promise of a strong demand for pure-bred stock. We anticipate that the present high prices of pure-breds will at least continue and perhaps increase considerably. A man who will start in, even in a small way, at this time to take good care of his stock and keep their records accurately and up-to-date, cannot help but benefit from the prosperity which is almost certainly ahead of the dairy industry.

From this letter we judge our correspondent to be fully capable of making a larger success with pure-bred cattle than with grades. It takes no more feed for pure-breds and takes no better handling to secure liberal production from them, and the offspring promise to sell for very good prices from this time on. We advise that rather than put the total sum available for the purchase of cattle into pure-breds, that it be divided between grades and pure-breds, buying a number of high-producing grades which can be secured at fairly reasonable prices and purchasing at least one or two well-bred, growthy, vigorous pure-bred heifers. These will mature in a short time and in a surprisingly brief period will form the nucleus of a goodly sized pure-bred herd. Frequently a pure-bred cow of some little age can be purchased which will drop several calves and will be valuable in that way as a foundation animal. We advise, therefore, that a start be made with pure-bred cattle at this time, but with the added caution that the start be made carefully, that is, by putting a small proportion of the available capital into pure-breds as a beginning.

Millet Seed for Cows

I have a large quantity of millet seed slightly "bin burned", just enough to spoil it for seed. Have sent sample to feed and seed company asking for offer. The question now comes to me, what is its value, finely ground to meal, fed to my milking cows? The question is, what is the feed value of millet seed meal compared with cottonseed meal?

Seneca, Ill. L. A. B.

Neither experimental results nor tests on practical farms are available to indicate the value of millet seed in a dairy ration. In feeding the seed to fattening swine, however, it has been determined to have a value about five-sixths as great as that of wheat or barley. In feeding baby beef more millet than corn was required. In feeding lambs, however, millet seed was found to be approximately equal to corn.

The first caution in feeding the seed is that in every case it should be ground before feeding. Never feed any class of farm animals unground seed. It is not only highly indigestible when unground and, therefore, of very little feeding value, but in many cases is dangerous and may cause the death of the animals fed.

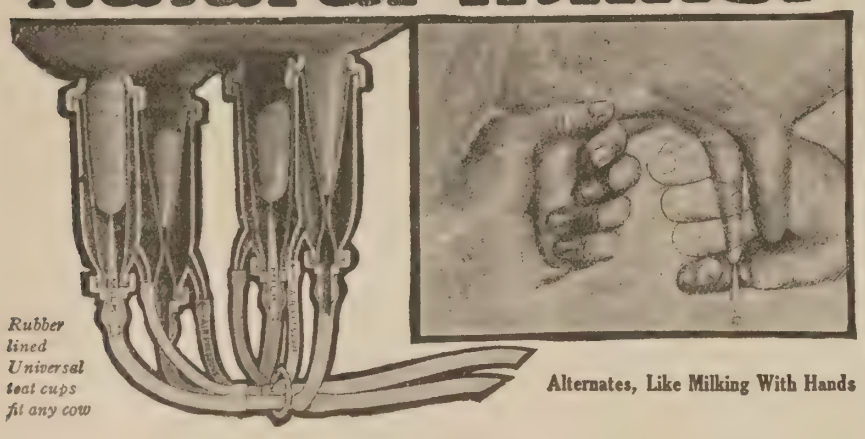
Ground millet seed compares somewhat closely in feeding value to corn, barley, and wheat. It is approximately equal to these feeds in protein but is somewhat lower in carbohydrate value, thus making its total content of digestible nutrients slightly lower than that for the other feeds.

In the dairy cow's ration, from the experiments cited above and from the chemical analysis of millet seed, we judge that millet seed may be given a fairly liberal place in a dairy ration. It should never be fed alone but should be combined with feeds higher in protein value. It would combine in a dairy ration with cottonseed meal and ground oats or wheat bran very well. A mixture of 200 to 300 pounds millet seed, 200 pounds bran or ground oats, and 100 pounds cottonseed meal, if fed at the rate of one pound for each three to four pounds of milk produced, and fed in addition to a liberal supply of a legume hay, should give very good results in milk production.

Thick and Thin Cream Comparisons

I have been furnishing cream to a private customer for five years. Average 10 gallons of 20% cream daily. Price is $1.50 per gallon. Have now an offer to furnish 40% cream to a large hotel for coffee. Will the richer cream be any more difficult to handle? Will it keep sweet in shipment just as well? How many gallons will I get of 40% where I now get 10 gallons of 20%? What price would be equivalent? What price do you think would be fair for me to ask? Why do the big milk companies decline to furnish this cream to this special hotel business?

Unionville, Ohio. M. T.



Ten gallons of 20% cream would make approximately 5.15 gallons of 40% cream. With the 20% cream at $1.50 per gallon, 40% cream would have to sell for $2.91 per gallon in order to bring the same return. There will be a slightly greater loss in handling the thicker 40% as more of it will adhere to the inside of the cans, and therefore we would suggest that its practical equivalent price would be $3 per gallon. When sold to a creamery when the cream is weighed in the can and the can rinsed to take out what remains, there is no greater loss in skimming a 40% cream than a 20% cream, popular belief to the contrary notwithstanding.

The richer cream will be no more difficult to handle, but care should always be exercised to see that the separator is working correctly. The Babcock test should be applied to the skimmilk frequently to see that there is not a loss here, and this applies whether skimming a thick or a thin cream. Many a farmer is losing the price of a separator every year through its improper operation or because some part has become worn and needs repair. The only measure of correct operation is to test the skimmilk and do it often. If it shows two one-hundreths of one per cent fat (.02%) or over, the separator or the operator are under suspicion and should be investigated to locate the trouble.

Rich cream will keep in shipment fully as well or better than thin cream, the only exception being that if the can is not kept full and the contents cool there is greater danger of the agitation churning it into butter. The higher testing cream stays sweet better because it contains less of the milk serum in which the lactic acid bacteria develop. We do not know why the big milk companies refuse to furnish the heavy cream, but possibly it is due to the fact that there is not a sufficient demand for them to vary their ordinary and usual operation, also consumers will more readily pay $1.50 per gallon for 20% cream than they will $3 per gallon for 40%. They judge with their eyes and a quart of 20% cream seems more than a pint of 40% cream; then, too, there are fewer uses for the richer cream.

It may be of interest to explain the computation of the equivalents of the two qualities of cream. Cream testing 20% will weigh approximately 8.5 lbs. per gallon; therefore, 10 gallons would weigh 85 lbs. and contain 17 lbs. fat. As cream increases in richness it weighs less per gallon. Cream testing 40% will weigh approximately 8.25 lbs. per gallon and will therefore contain 3.3 lbs. fat. As the 10 gallons of 20% cream contain 17 lbs. fat, we will find the number of gallons of 40% cream by dividing 17 by 3.3, which gives us 5.15 gallons. The ten gallons of 20% cream are worth $15 and the 5.15 gallons of 40% cream should be worth the same total amount, or $2.91 per gallon.

Universal natural milker

Rubber lined Universal teat cups fit any cow

Alternates, Like Milking With Hands

Easier, Better, 730 Times a Year

RIGHT NOW farm help is hard to get—all the time and effort you can save is good business as well as patriotism.

Why stick to the old-fashioned, laborious, time wasting, hand milking method while other farmers are saving time and making bigger profits by using the modern Universal Natural Milker?

One Universal lasts a life time.

It alternates, milking two teats at a time, while it is massaging and relieving the other two, imitating nature closely.

It is simple, dependable and always ready to work. Write us.

One Man With Universal Worth Three Without It

Dear Sirs:

We are using one of your milking machines and are very much pleased with it. We find that our man can milk three times as many cows with the machine as he could by hand, and easier. We had no trouble breaking the cows to milk, in fact, some cows milk better with the machine than by hand.

Yours very truly,
(Signed) H. D. Ross & Son
Lowville, New York

The Universal Milking Machine Company
403 Mound Street, Columbus, Ohio

Husking cost saved!

—that's what this Appleton husker and shredder would really mean to you. While husking the ears, it cuts or shreds the leaves and stalks—farm tests proving that this *prepared* fodder has *twice* the feed value of standing stalks or shocks. This increased feed value pays the *whole* cost of husking, besides giving *far greater* manure value. The Appleton was

the first successful machine husker made

For 20 years, wherever huskers have been used, the superiority of the Appleton has been recognized. Its perfect husking device, which made this machine nationally famous, was an *Appleton patent.* No other type of husker can equal it for

clean husking, well prepared fodder and little use of power.

Solid simple construction makes it practically trouble-proof and so *durable* that models made years ago still give good service. Automatic safety lever, enclosed gears and positive gripping feed rolls make it the *safe* machine. Cutter or shredder head interchangeable. Cutter head requires less power and can be arranged to cut 4, 2, 1 or ¾.

FREE
Send for Husker Book

Don't delay, send for free booklet now.

This Appleton is an *essential* machine. Now when feed is *worth* more and labor is scarce, it is a better investment than ever. Your silo will take only a *part* of the crop. Save the *full fodder* value of the rest by *preparing* it for barn feeding. You'll save money and conserve feed for the Nation. Made in 2, 4, 6, and 8 roll sizes for 4 h. p. and up. Get the facts—send for big illustrated book *today.*

Husker & Shredder

Dollars and Ideas

If you have a dollar and I have a dollar and we swap dollars we'll be exactly where we started in the beginning, won't we?

But if you have an idea and I have an idea and we swap ideas, I'll have two ideas and you'll have two ideas, your own and mine. Isn't that right?

The National Dairy Show, held at Columbus, Ohio, is a vast clearing house for ideas. Here you can go and swap ideas with Tom Brown of Ohio, Bill Smith of New York, Jim Dorr of Wisconsin, the Toms and Bills and Jims of Illinois, Indiana, Pennsylvania, Iowa, and Louisiana—practical dairymen, like you, from all over the country. Tom Brown's son will be there with his dad, and Bill Smith's son will be there with his dad; and while you and Tom Brown and Bill Smith are telling each other how you're getting the best results from a particular feed ration, Tom Brown's boy and your boy will swap experiences in the raising of the prize calf in the local club.

And if your boy doesn't come back from the show with you with a new idea of farm work and a strengthened determination to make good on the farm, I don't know the American boy, that's all.

Your meeting up with other men there, too, will be tremendously worth while to you. Because, like you, all the men you'll meet there, at the show ring, before the exhibits or at the lectures, are men who came to learn something new about their business.

It is a show for the practical farmer, a show for you.

The big men of the dairy industry will be there to give you free the benefit of their past year's experience in breeding. Experts from the United States Department of Agriculture will talk on feeds and feeding, on the prevention of contagious abortion, tuberculosis, and other diseases from which to guard your herd. The importance of cow testing and sire selection will be brought home to you as never before.

The manufacturers of dairy equipment will show you how to make one hand do the work that formerly required two, how machinery may take the place of human muscle, how to get the biggest profits from your dairy at the least expenditure of time and labor and money.

You'll see the best dairy cattle in the world. You'll find out how your herd stacks up. You'll get a chance to test your judgment of what is a good dairy cow. You'll see what to work for in your own herd.

And the experience will be worth many, many times more than you paid for it.

The National Dairy Show is Oct. 10-19th at Columbus, Ohio.

Wisconsin. RUDOLPH KREBS.

Cost $2.50 so far

One month old, 150 lbs. 50 lbs. when born.

Blatchford's

Sell your milk. Raise your calves on Blatchford's Calf Meal at ¼ the price of milk. The other ¾ stays in your pocket as clear profit.

Send for Pamphlet Shows you how to make two profits instead of one.

Blatchford Calf Meal Co.—Dept. 4546—Waukegan, Ill.

DAIRYMEN!
Velvet Bean And Pod Feed

Will Solve Your Feeding Problems.

A feed made from Velvet Beans and Pods ground into a meal. Contains no mixture or adulterant.

Analysis (Guaranteed Minimum)	
Protein	16.50 to 17.50
Fat	4.00 to 4.50
Fibre	15.00 to 12.50
Carbohydrates	50.00 to 52.50

Both Indiana (Purdue University at La Fayette) and Louisiana, as well as other states that have analyzed this feed, give it much better reports than our guarantee.

For Cattle, either Dairy or Fat Stock, use in same manner as you use 36% to 38% Protein Cottonseed Meal. A mixture of about 75 lbs. Velvet Bean and Pod Feed with 25 lbs. Cottonseed Meal will give the same results, or nearly so, as 100 lbs. of 36% Cottonseed Meal.

A splendid Dairy Ration is as follows:—
Velvet Bean and Pod Feed..... 50 lbs.
Cob Meal (or a like feed)..... 40 lbs.
Cottonseed, Linseed or Peanut Meal.. 10 lbs.

Work out a ration for your individual needs on this basis, using your Silage or whatever rough feed you may have.
Correspondence solicited.

First Meeting Wisconsin Dairy Council

(Continued from page 227)

tural interests of Wisconsin. The Wisconsin Dairy Council is, of course, interested in the welfare of each one of these associations, but its field is to unite these many organizations for the purpose of creating a larger demand for dairy products. It proposes to carry the message to the consumer regarding the food value of milk, the food value of skimmilk, the food value of cheese, and the food value of butter as compared with other foods. It is not its purpose to interfere in any way with the activities of other organizations engaged in several fields of endeavor for the promotion of the dairy industry.

It is perhaps not out of place to state briefly why and how the Wisconsin Dairy Council was formed. A preliminary meeting of Wisconsin dairymen was held in the Gold Room of the Hotel Wisconsin, Milwaukee, Aug. 7, '18. The meeting was called to order by A. J. Glover, temporary chairman, who spoke in part as follows:

"Recently two meetings were held by men interested in the welfare of dairying, their purpose being to lay plans for the development of the dairy industry and to provide means for educating the consumer regarding the importance and food value of milk and its products. One of these meetings was held at the Wisconsin College of Agriculture and the other in Milwaukee. These two groups then reassembled and a committee was appointed to wait on the State Council of Defense for the purpose of requesting that organization to call a meeting of representatives of the various state dairy and agricultural organizations to consider the feasibility of forming a state organization through which all dairy and agricultural interests might unite in a campaign to inform the consuming public regarding the food value of dairy products.

"The committee appeared before the members of the State Council of Defense, presented their arguments for a meeting of the dairy interests. The State Council of Defense granted the request and I was appointed by Mr. Magnus Swenson, chairman of the State Council of Defense, to call together the representatives of the various dairy and agricultural organizations.

"The purpose of this meeting was to consider the feasibility of organizing our dairy and agricultural associations that they may effectively unite in the development of our dairy industry. There is no state in the Union which enjoys as complete an organization of its agriculture as Wisconsin. It may be reasoned that we already have more agricultural organizations than can be operated to the advantage of agriculture, but a survey of our situation will reveal that we have no organization through which the various dairy and agricultural organizations may co-operate for a common cause. It is the conviction of those who have at heart the development of our dairy industry that we should have a state-wide organization that would have within its ranks representatives of the various branches of the dairy industry.

"In the early years the Wisconsin Dairymen's Association represented every branch of the dairy industry. Every dairy activity worked through this association. It set the pace and was instrumental in establishing the Wisconsin Dairy School,—the first school of this character in the United States,—the Dairy and Food Commission, and the Wisconsin Farmers' Institute. The first job it tackled, after organization in 1872, was to secure a market for Wisconsin cheese. "At this time it sent a representative, none other than W. D. Hoard, later governor of the state of Wisconsin, to Chicago for the purpose of securing refrigerator cars in which Wisconsin cheese might be shipped to market. The railroad officials rather made fun of this idea and asked if Pullman cars would not be more desirable. But, the refrigerator cars came and a market was opened for the cheese of Wisconsin. The Wisconsin Dairymen's Association did not stop here, but sent exhibits of butter and cheese to various national exhibitions. The high quality of dairy products selected for these exhibitions led to a demand for Wisconsin dairy products. This was effective advertising. The dairy industry at that time amounted to about $1,000,000 per year and now it is about $190,235,000.

Thousands of Dollars Added to Cattle Profits!

WASTE feed is exacting a heavy toll from cattle men who feed *whole grains. Fully 20% is wasted.*

This is proved by the fact that fully one-fifth passes through livestock *undigested.* Why feed 20% of your costly feed to the *manure pile?*

Grinding your whole grains and roughage will save this loss. *Ground* feed is easily and wholly digested. Animals thrive on it better.

Because of the remarkable results obtained and the big saving on feed cost, thousands of farmers are now feeding balanced rations — properly proportioned concentrates and roughage reduced to a flour-like, predigested form by the celebrated

LETZ

America's Leading Feed Mill

The Letz is the first mill to meet every feed grinding requirement. It is famous for fine grinding and capacity.

Grinds corn, rye, oats, barley and all kinds of grains; grinds them with clover, alfalfa and other properly proportioned roughage and concentrates into fine, wholesome meal. Handles everything wet or dry—cannot clog—is durable—is most economical to operate. A Letz on your farm means an easy 20% cut on feed bills!

Letz-ground meal, because of its powder-like form, is preferable to all others. It is more nourishing—better liked by animals.

848 Keen Cutting Edges

Letz patented *grinding plates* lead the world in fine-cutting, capacity, light running and durability. They grind anything that needs grinding! 848 keen cuting edges pulverize the grain into powder. Plates are self-sharpening. Can be run together for hours—empty without slightest injury. Cutting edges will be sharper than before. One set is guaranteed to average 2,000 bushels of moderately ground feed before replacement is necessary.

9 Sizes
22 Styles

We guarantee that the Letz will grind more grain on less fuel and grind it better than will any other process, bar none. This is why feeders making the *biggest profits* by grinding their own feed, *are the feeders who use the LETZ!* The Letz has many other practical, labor-saving, cost-cutting features, including force feed, ball end bearings, etc.

Investigate NOW—Today!

High prices of feed costs and big profits in Hogs and Cattle make it now more necessary than ever to feed *ground feed* aud save the costly 20% waste now going to the manure pile. Over 28 years of unquestioned leadership is behind the Letz. Investigate! Write for our big catalog and our free book, "Feeding Farm Animals." Tells all about *Balanced Rations* and how to get maximum results at lowest cost. Copy mailed free of charge. Send a postal card *at once.* Address

Grind for Your Family Table

Thousands of Letz users grind their own corn meal and corn, oat or barley flour. The wonderful Letz silent Buhr grinding plates, with their 848 keen cutting edges, cut and grind the flour in one operation—reduce the cost of living.

We also make a SPECIAL Mill for the South, the Letz Dixie

A new type of mill—cutter and grinder combined — designed especially for Southern grinding requirements. Grinds velvet beans, vines and all, green or dry kaffir, sorghum, cowpea, hay, peanuts with vines—anything. Ask for Dixie circular.

See Lalley-Light In Action at the Fair

Lalley-Light will be exhibited, and in operation, at most of the county and state fairs this fall.

We ask you to note particularly the way it runs, and the character of the electric light and power it produces.

If you will do this, we count on the plant itself to convince you of the superiority it has proven in eight years of every day farm use.

You probably will be impressed, first, with its extremely smooth running; and the fact that a low hum is all you hear when it is running.

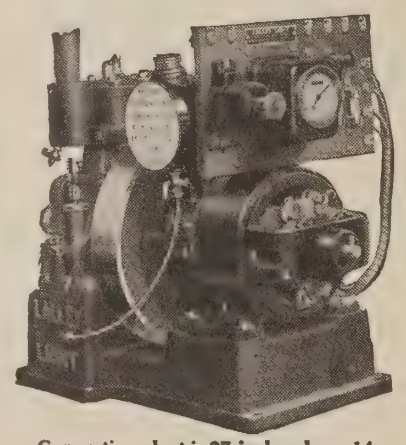
You will see that the electric lights are strong and steady all the time—without even a suggestion of a flicker.

You will observe, also, the same steady flow of power to the electrical machines which may be exhibited.

The men in charge will explain that Lalley-Light furnishes light and power from two sources—the storage battery; and the generator, independently of the battery.

That means with Lalley-Light you are doubly sure of having light and power.

Even if you are not of a mechanical turn, you can't help admiring the unusual simplicity of the plant, and its very compact design.



We urge you to study Lalley-Light, because it points the way to a great saving of farm labor and an equal increase of comforts and conveniences on the farm.

Next year the farmer's need for Lalley-Light's reliable, economical power and light will be even greater than this year.

You should prepare now to meet that need.

If Lalley-Light should not be displayed at your home fair, write to us for details and name of the nearest Lalley-Light merchant.

Lalley Electro-Lighting Corporation
763 Bellevue Ave. Detroit, Mich.

Generating plant is 27 inches long, 14 inches wide, 21 inches high. Storage battery is included in complete outfit.

Making Cheese at Home

(Continued from page 219)

will press upon them and hence upon the cheese. Let this stand until noon, then add some weight to the free end of the lever to give more pressure to the cheese. At night wet a clean cloth, remove the cheese from the press, turn it over, put the clean cloth in the hoop, and place the cheese bottomside up upon it. Smooth ends of cloth over top of cheese, put on follower, weights, and lever, and leave for the night. A little extra weight is put on the lever at night.

Leave cheese in the press until your next one is ready for it, providing you make one the next forenoon. Then remove from the press, take to the house, rub well and hard with butter on all sides. Make a thin bandage for it, and sew it in place to prevent spreading of the cheese. Place upon a clean cheese cloth or flour sack, fold the corners loosely over it, and place in a warm, airy place for curing. The curing is simple. All the cheese needs is to be rubbed daily, rubbed hard, and turned over whenever the cloth becomes the least damp. At first the cloths must be changed quite often, but after the first few days the cheese should have something of a crust, and no more whey exudes. But daily rubbing and turning are necessary as this prevents mold, and also shows if any insect is hovering near. The cleaner the cloths are kept the less danger from insect inroads. The warmer and more airy the place, up to summer heat, the quicker the cheese ripens for us. Our first cheese of the season generally gets out in four weeks from date of making, but it is much better after six weeks. After cheese is thoroughly ripened it may be covered with paraffine and put away. They can be kept all winter that way if kept from freezing and from mice.

The Cheese Fly

A word in regard to insects. The common house fly does not as a rule bother a cheese, although they might if plentiful and the cloth attracted them. The cheese fly, the one whose eggs make cheese mites, is a slim little creature shaped something like a mosquito. When you see such a fly hovering near your cheese, give it chase and be sure you get it. The cloth covering the cheese should be thin and should be folded loosely to allow air circulation, but it should be so folded as to exclude all insects.

Aside from the cheese fly, the only insect we have ever had to contend with is what is known as the common "flour bug". It is maybe half an inch long, is striped in dull colors crossways. It is offensive looking, and is offensive acting. These bugs are not plentiful but sometimes they creep out, and if one gets into a cheese it will burrow inside, and lay eggs and —well—!!!!! No words needed. This never happened to me but once, and then to a cheese left neglected on a shelf.

If the whey exudes slowly from the curd, it is because the milk was not warm enough, or because too little rennet was used. Either case makes the cheese too soft and much of the goodness goes off in the whey. The only possible remedy I know is to heat whey to a hundred or one hundred and five degrees Fahrenheit and pour over the curd, and keep doing this until it assumes the proper consistency. The curd should cling together in large lumps, if just right, but it should not be too tenacious. If it is hard and does not separate easily, it means either that the milk was too warm, or too much rennet used. It proves that doing a thing just right

is the best and easiest way to reach right results.

If, after a cheese is taken from the press, it leaks whey and wets the covering quickly, there is nothing which can be done except to let it leak, but change the cloths as often as wet. This shows one of three things—too little heat to milk, too little rennet, or too little pressure. Such a cheese will in the course of time ripen but it stands a much better chance of being sour than it otherwise would. It would not be a good keeping cheese.

The making and curing of one cheese will teach one more than volumes of writing or printed rules. Cheese making from this rule is easy, is simple, and it brings about a result very much like the regular commercial cheese.

Recipes for Cheese Dishes

We use cheese in many dishes more than we do just as plain cheese, though that is always a nutritious, appetizing way to use it. Following are some recipes for cheese dishes:

Welsh rarebit: This is our favorite of all cheese dishes. One cup sweet milk, bring to boil, thicken with one dessert spoonful of flour, before mixing up the flour stir in a little salt and about one-fourth level teaspoon of mustard. Mix flour smooth with milk, thicken the hot milk with this and let boil well. Add one cup of ground cheese and let it melt. Last of all add one egg, beaten just enough to break yolk and mix yolk and white. Serve as soon as this is stirred in and cooked which will be in about one minute. Adding the egg at the last insures a smooth rarebit. The flour is very important, and the cooking in the milk before the cheese is added helps greatly towards a velvet smoothness.

Cheese souffle: Two cups of sweet milk, a little salt, heat milk and add two cups of fine bread crumbs, then a cup of cheese, and two well beaten eggs. Bake twenty minutes, or until the custard is set.

Cheese eggs: Two cups of sweet milk, one dessert spoonful of flour, two eggs, one cup of ground cheese (in fact, all these recipes are finer if cheese is ground or grated) and a little salt. Thicken the milk with the flour and, when this has boiled well, add the cheese and the two eggs. When the mixture is smooth and creamy, break as many eggs as desired into it, and let cook by placing in the oven a few minutes. Salt the eggs before putting in the oven, and a piece of butter on each egg keeps them from crusting over. Let cook to the desired softness or hardness. Dip egg and cheese mixture on to slices of toast.

Cheese dreams: Butter and then cut stale bread in thin slices, sprinkle heavily with ground cheese (a meat chopper for grinding is used), add chopped English walnuts, press two slices of bread together, dip in beaten egg thinned with a tablespoonful of milk, fry in hot butter or drippings until the cheese is well heated and the bread a golden brown. These make a delightful dish for luncheon or for Sunday night supper. We sometimes grind enough cheese for several cheese dishes and put in a can for future use.

New Milling Plan in Brief

A new plan of flour-milling-profit control, to establish definite fair prices at every mill point in the United States, is announced by the U. S. Food Administration. This plan is expected to be permanent throughout the 1918-1919 crop year, with possibly some modifications under special circumstances.

Details of special interest to farmers include the following provisions:

A schedule of fair flour and feed prices have been evolved, but it is expected that competition will very often result in lower prices for mill products than the "fair price" schedule.

Must Display Price Schedules

Each invoice of the mill must have printed on it the "fair prices". Consequently it is very easy for any representative of the Food Administration or for any buyer to know whether a mill has overcharged.

The wheat miller must display in his principal place of business (and mills, warehouses and agencies) the price schedules and package differentials furnished by the U. S. Food Administration.

After careful investigation of handling costs, the Food Administration has announced what additional charges will be considered fair for sales of wheat flour in less than carload lots. The amounts range from 25 cents to $1.20 per barrel, depending on size and nature of transaction.

The maximum permissible margins for sales of food to wholesale and retail dealers range from $1 to $3 per ton over the fair price basis.

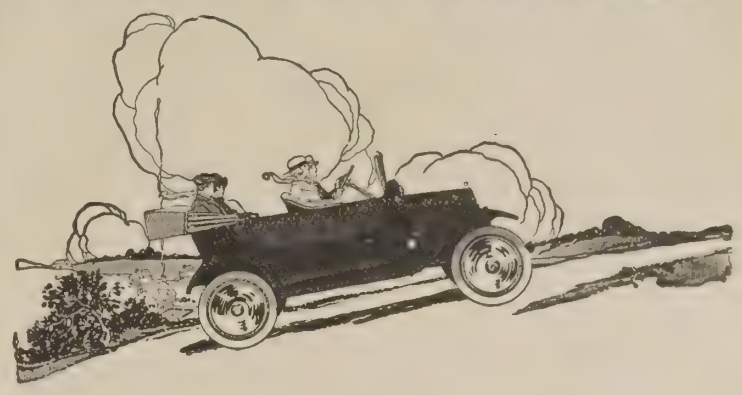
Sales of feed to consumers must be made at reasonable margins to be determined by the Federal Food Administrator of the state in which the mill is located.

In selling wheat mill feed to the consumers at the mill, if the producer desires to buy wheat mill feed in bulk and the sacks are kept and left at the mill in undamaged condition, the miller shall not add to the purchase price any charge for sacks.

Charge for Custom Grinding

The wheat miller who receives wheat from farmers' wagons and grinds such wheat on a custom basis or exchanges it for flour or feed, may charge not to exceed 35 cents per bushel for each 60 pounds of clean wheat so received. The miller is required to return to the farmer flour and feed in accordance with a specified schedule.

The maximum quantity of flour which a wheat miller may deliver to any individual consumer without special permission is 25 pounds for persons living in towns or cities and 50 pounds for residents of rural and farming communities. The regulation of the amount of flour which can be obtained in exchange for wheat and the requirements for the sale of substitutes to individual consumers are somewhat different in different states. Information covering these regulations will be supplied by the Federal Food Administrators on request.



The entire plan is aimed at the elimination of profiteering and waste and is designed to secure the freest possible movement of the wheat crop consistent with necessary conservation.—U. S. FOOD ADMINISTRATION.

Gamble Goes to Maryland

September first J. A. Gamble gave up his work as Market Milk Specialist with the Dairy Division to accept the professorship of Dairy Husbandry at the Maryland State College of Agriculture.

Mr. Gamble has given considerable attention to the subject of cooling dairy products, having written a Farmers' Bulletin on that work. Other investigational work he has conducted concerned the effect of feeds on the flavor and odor of milk. He is a member of the milk and cream regulation committee of the American Association of Dairy Science, has judged milk and cream at the large dairy products exhibits of the East, and for three years has superintended the milk and cream exhibits at the National Dairy Show.

FORD EFFICIENCY

Four heat conditions scientifically met by Gargoyle Mobiloil "E" in Ford engines

If you have driven your Ford very long, you have no doubt met with a problem, more or less common to all cars.

That is—a tendency of the engine to overheat. This is generally most noticeable after continued running on low gear.

True, your thermo-syphon cooling system absorbs much of the excess heat of the combustion chambers.

But your water cooling system should not be called upon to absorb and radiate the heat of friction. Most of that task belongs to the lubricating oil.

But of even greater importance is the ability of the lubricating oil to perform its function of minimizing friction and thus reducing friction heat.

Four common forms of overheating are described below. Each one traces back directly to your oil supply.

(1) **Friction Heat on Cylinder Walls.** This is caused by oil too light or too heavy in body for the Ford engine If too light, it fails to thoroughly separate friction surfaces. If too heavy, it is not distributed properly, leaving cylinder walls and bearings partly exposed. In either case excess friction follows. Heat mounts up.

The body and character of Gargoyle Mobiloil "E" are such that it will feed readily, distribute thoroughly and form a protecting film between cylinder walls, pistons and piston rings.

(2) **Excessive Crank-Case Heat.** Normal crank-case heat is about 140° F. But if the oil does not tightly seal the Ford piston rings, part of the heat of each explosion shoots down past the piston to further heat the oil in the crank-case. Crank-case heat may then rise 40° to 50° higher.

Gargoyle Mobiloil "E" will thoroughly seal the Ford piston rings. The heat of the explosion on the power stroke is kept above the piston, where it belongs.

(3) **Hot Bearings.** Bearing surfaces, when seen through the microscope, show tiny hills and valleys of metal. The oil must thoroughly fill in these valleys and cushion the peaks or excess friction will result. If not, hot or burned-out bearings follow.

Gargoyle Mobiloil "E" is of the correct body to lubricate the Ford bearing surfaces, thus preventing them from rubbing against each other.

(4) **Heat Absorption and Radiation.** On warm days you will sometimes see Fords running under overheated conditions due to the use of an oil of low quality or poor heat radiating ability.

Ford owners who use Gargoyle Mobiloil "E" are free from this trouble, owing to the ability of the oil to minimize friction and to absorb and radiate heat.

The following test will show you the importance of scientific lubrication in the efficient operation of your Ford engine:

An Economical Demonstration

It will cost you little to fill your reservoir with Gargoyle Mobiloil "E." The garage or dealer you trade with has it, or can promptly secure it for you.

Ask him to empty your reservoir of its present oil and fill it with Gargoyle Mobiloil "E." You can then judge for yourself the results in cooler operation, gasoline economy and reduced oil consumption, to say nothing of reduced carbon deposit and greater power.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloil "E" from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container. If the dealer has not Gargoyle Mobiloil "E," he can easily secure it for you.

YOUR TRACTOR

also may be lubricated efficiently with Gargoyle Mobiloils. On request we will mail you a separate Chart specifying the correct grade for each make and model of tractor.

VACUUM OIL COMPANY, New York, N.Y., U.S.A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

Domestic Branches: Detroit, Boston, New York, Philadelphia, Kansas City, Kan., Indianapolis, Minneapolis, Pittsburgh, Chicago, Des Moines

Central Michigan Holstein Breeders Meet

HOARD'S DAIRYMAN:—The Central Michigan Holstein breeders held their second bi-annual picnic of the season at the farm home of A. R. Black and Sons, Tuesday, August 13. The day was ideal and the fine grove in the front yard made an excellent place for the gathering. There were about two hundred fifty farmers and their families present, representing the breeders within a radius of fifty miles. At noon everyone enjoyed an old-fashioned basket picnic dinner, with all the ice cream that one could eat. Following the dinner Prof. A. C. Anderson of M. A. C. gave a judging demonstration, using a prize bull calf from Mr. Black's herd.

The program for the day included songs, dancing, and a splendid patriotic address. Mr. Horace Norton of M. A. C. gave some timely suggestions in regard to holding a consignment sale next winter. Mr. Norton's one strong point was that to have a successful sale only the best type of individuals must be consigned, more emphasis being put on type than on the individual's records. Mr. Albert Jenkins, chairman of the sales association, gave a report of last year's sale that was very pleasing, considering it was the breeder's first attempt.

After a brief discussion, the breeders voted to hold another sale this coming winter, at the time of the breeders' meeting, and gave the president power to appoint a sales committee.

FRED R. MCDONEL, Sec.

Value of Skimmilk as Food

"It is bad economy," according to B. H. Rawl, Chief of the Dairy Division of the United States Department of Agriculture, "to feed 100 pounds of albumen, casein, and milk sugar into an animal for the sake of producing five pounds of pork, part of which is bone and gristle and not edible."

This statement was made by Mr. Rawl while in Columbus to give the preliminary instructions for the government's participation in the National Dairy Show, to be held October 10-19. It indicates the next big problem in conservation which the Dairy Division of the Department of Agriculture expects to take up and popularize.

"I do not mean," says Mr. Rawl, "that farmers should not feed skimmilk to their hogs, for under existing conditions that is all many of them can do with it. Millions of pounds are absolutely wasted, not even having the same percentage of conservation secured by feeding to the hog. What we must do is to educate the people of the United States to the very high food value that is now being wasted. That is one of the missions which we hope the National Dairy Show will help us to accomplish.

"The war experience of the government in the matter of educating the public has been most encouraging. In the recent campaign to popularize the use of cottage cheese, we have several authentic records where the daily consumption has gone from 300 pounds to a ton in a day. The proper utilization of skimmilk is the next big problem for us, as I see it. There are at the present time in the United States something like 15 billion pounds of this available annually, which is very largely wasted. The ideal use for skimmilk is the manufacture of milk powder, which at the present time is only an infant industry. The difficulty in utilizing skimmilk by this process is the time and investment required in manufacturing milk powder.

"There are many ways in which skimmilk can be employed advantageously in the home cooking. This is particularly true in the making of soups and other meat substitute foods. In the form of powder, skimmilk can be used for practically all cooking needs where raw milk is usually employed."

Mr. Rawl has just returned from an inspection tour in the extreme West and gives it as his opinion that in the main, the dairy industry of the United States is holding its own in spite of adverse conditions which have governed it for the last six months.

"It must not be forgotten," he says, "that since the war we have changed an adverse balance of 500 million pounds of milk to a favorable balance of 1,500 million pounds in our favor. This is not a falling off in domestic consumption, attributed in part to high prices. Our department is now working with the extension departments of schools and universities throughout the United States in bringing to the attention of the people of the country the value of milk, and information how to use it to their own best advantage. We do not believe that the consuming public as a whole has an adequate conception of the importance of the dairy industry to the welfare of the nation. We are organized to help bring this about and that is a justification of the government in participating in the big National Dairy Show."

Ohio. T. T. FRANKENBERG.

DAIRY MARKETS

CHICAGO, Sept. 5—Butter—Higher; receipts, 10,789 tubs; creamery, extra, 47½c; firsts, 44½@47c; seconds, 34@44c; standards, 46¾@47¼c.

Cheese—Unchanged.

Eggs—Unsettled; receipts, 11,106; firsts, 40@40½c; ordinary firsts, 37@39c; at mark, cases included, 37@40½c.

MILWAUKEE, Wis., Sept. 5—Butter—Creamery, fresh, extras, tubs, 1 lb., 46½@47c; prints, 1 lb., 48c; extra firsts, 44@45c; firsts, 41@43c; seconds, 38@40c; process, 38@39c; dairy, fancy, 42c.

Cheese—American, full cream, Twins, 26@26½c; Daisies, 27@27½c; Young Americas, 26½@27c; Longhorns, 27@27½c; Brick, fancy, new, 1 lbs., 31@32c; Limburger, old, fancy, Bricks, 27c; 1 lb., 28c; Swiss, loaf, 45@47c; block, 34@36c.

SHEBOYGAN, Sept. 2—On the Sheboygan dairy board eight factories offered 384 boxes of Longhorns, 306 of which sold at 26c and 78 at 26¼c.

NEW YORK, Sept. 5—Butter—Strong; receipts, 9,071; creamery, higher than extras, 50½@51c; extras, 49¾@50c; firsts, 47½@49½c.

Cheese—Firm; receipts, 2,851; state, whole milk, flats, fresh specials, 27@27¼c; average run, 26½c.

PLYMOUTH, Wis., Sept. 2—On the Wisconsin cheese exchange twenty-nine factories offered 2,933 boxes of cheese which sold as follows: 160 squares at 28¼c, 425 Twins at 25¾c, 75 at 25½c, 1,600 Daisies at 26¾c, 325 Double Daisies at 26½c, 348 Longhorns at 26c.

APPLETON, Wis., Sept. 2—Seven factories here offered 359 boxes of cheese on the local call board on Tuesday; sales were 319 Twins at 25⅜c and 40 Double Daisies at 26½c.

SPRING GREEN, Wis., Sept. 2—Offerings of cheese on the Spring Green dairy board of trade on Tuesday were 993 boxes of Single Daisies. All sold at 26¾c.

THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Write AERMOTOR CO., 2500 Twelfth St., Chicago

BUY THE BEST
I offer sons of Lord Fayne Valdessa No. 187263 whose two nearest dams average 33.31 pounds butter and 585.30 pounds milk in seven days. Dams are granddaughters of Colantha Johanna Lad, one of the greatest sires in the world. Have choice individuals from yearlings to calves at reasonable prices.
C. H. DAVIES, - SHIPMAN, ILLINOIS.

For Sale: Bull Calves

6 to 7 months old. A. R. Dams. Sire a grandson of Dolly Dimple's May King of Langwater.
Jericho Guernsey Farm, N. C. Dahl, Owner, South Haven, Mich.

Young Bulls From Seven-Day and Yearly Record Dams

Dams of all bulls have official records of from 15 to 25 pounds of butter. All are now on yearly semi-official test and will complete records this fall and winter. Nearly every cow has completed cow testing records for three years and has produced up to 600 pounds of butter. These cows are never pushed to the limit. The bulls offered are sired by bulls secured from the E. C. Schroeder and other noted herds. Sires' dams have records up to 950 pounds of butter. Bulls are heavy bone, straight, well marked and large for their age. They will and must please. We guarantee satisfaction.

First Meeting Wisconsin Dairy Council

(Continued from page 231)

"The Wisconsin Dairymen's Association also sent instructors to creameries and cheeseries for the purpose of improving the quality of our butter and cheese. It encouraged farmers to keep a better class of dairy cattle and to improve the character of crops for live stock. To the regret of the early organizers of the Wisconsin Dairymen's Association several branches of the dairy industry have left the parent organization and formed associations to deal especially with some particular phase of the industry. The hive became so large that its members swarmed. We now have the Wisconsin State Buttermakers' Association, the Wisconsin State Cheesemakers' Association, and the Wisconsin State Breeders' Association. They again have been divided into smaller units and we have county buttermakers' associations, sectional cheese associations, state breed associations, and county breeders' associations. Under the wing of the Wisconsin Dairymen's Association we have 115 cow testing associations. Besides these organizations we have local federations, notably among them is the Cheese Producers' Federation of Plymouth. These are local dealers' associations. Then we have the Wisconsin Cheese and Butter Industry Protective Association. In recent years many local milk producers' associations have been formed. Among our state agricultural organizations interested in the development of the industry we have the Wisconsin State Grange and the Society of Equity.

"Those responsible for the organization of the Wisconsin Dairymen's Association, and among them was former Governor Hoard, saw tremendous advantages to the dairy industry of Wisconsin to have all dairy activities remain under its jurisdiction. This would give opportunity for unity of action which cannot be accomplished when each branch of the industry is separately organized. We now see that these men had a clear conception as to how organization could protect and further an industry. We have come here for the purpose of bringing the many dairy and agricultural organizations together that they may again co-operate as was planned by the men who organized the Wisconsin Dairymen's Association. In calling this meeting it was attempted to bring together representatives of all our state organizations and such other organizations as would be interested in a meeting of this character. All the chairmen of the county councils of defense were invited; chairmen of the county agricultural committees, and county agents in easy range of Milwaukee were notified of this gathering. The College of Agriculture, the Department of Agriculture, and the Dairy and Food Commission were requested to send representatives. It would be a source of regret to me if I have overlooked any organization entitled to representation at this meeting. It is my sincere belief that if we are to organize a harmonious and effective organization through which our innumerable dairy and agricultural societies may work, everyone should have opportunity to help organize such a body and have something to say in directing it.

"The uniting of these forces which I have briefly mentioned should bring to the dairy industry new inspirations and new opportunities. This corporation could well be called the Wisconsin Dairy Council. Its purpose would be to educate the consumer regarding the food value of dairy products, to promote the dairy industry, to give publicity and to advertise dairy products, in order to encourage their consumption."

In the near future we shall publish the articles of organization and by-laws of the Wisconsin Dairy Council.

When Dairy Cows Fight Flies Their Milk Flow Decreases

Decrease in milk production, loss of live weight, discontent, and unrest are promoted among herds during the summer months as the consequence of the activities of the common stable fly and horn fly. An average decrease in milk flow of from 25 to 40 per cent is not uncommon as the direct result of flies and extreme heat of summer. Under existing conditions with a keen demand for dairy products and with prices at a high mark, it is highly desirable that every dairy farmer exercise a maximum care and caution to eliminate the fly evil, according to dairy specialists of the United States Department of Agriculture. Remedies are darkened barns, stable sanitation, and spraying with fly repellents. Thorough treatment of manure, its daily removal from the barn to a distance, the use of hanging burlap or other devices in the barn doors to brush flies from animals, baited fly traps placed outside the barn, and closed milk pails are among the necessary requirements for keeping flies away.

The stable fly, armed with biting mouth parts, punctures the hide of of cows and sucks their blood, while the horn fly locates at the base of the horns where it irritates the skin and causes the formation of congestions which resemble mosquito bites. Both species of these flies propagate rapidly and require only from 10 to 16 days in which to hatch their eggs and produce new hordes of pests which operate for cow discomfort.

Stabling and Spraying

The stabling of cows during the heat of the day in cool, darkened barns is recommended as one of the best means of eliminating the fly evil, provided adequate labor is available to keep the stables clean and sanitary. As manure provides an ideal breeding material for flies, it is imperative that none of it be allowed to accumulate in or around the stable. Spraying the animals with some fly repellent, such as kerosene emulsion, is an effective remedy, but requires repeated applications. Repellents should be used with care, as no good one has yet been devised which is not likely to slightly taint the milk. It is best to spray the cow just before milking each evening, using a hand spray pump or applying it with a brush or a sponge. There are some anti-fly solutions on the market which are more or less effective. Most of them consist of some coal-tar product combined with either fish oil, oil of tar, or rosin. Lime sprinkled about the barn on manure is also useful in destroying flies.

To prepare kerosene emulsion—one of the cheapest and best home-made fly repellents—dissolve one-half pound of yellow soap in a gallon of soft water heated to the boiling point, and with this combine 2 gallons of kerosene in a barrel where the solution can be churned vigorously. Dilute this mixture with 6 gallons of water. This amount of emulsion is sufficient for spraying 100 cows and should be prepared only as needed. When smaller amounts are required they should be prepared in the proportions given.—Weekly News Letter of the U. S. Dept. of Agr.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

You Select the Seed Corn

What was one of the serious problems many of our farmers had to face this spring? Seed corn, wasn't it? Where to get enough satisfactory seed and at reasonable prices was indeed a problem. Last year, in the northern sections at least, early frosts caught most of the corn before it was ripe and in a great many fields there was but little opportunity to gather seed.

A HANDY WAY TO GATHER SEED CORN—(Illinois Circular 225)

Moreover, not all the fairly good seed was saved that might have been.

Now we, and that means Hoard's Dairyman Juniors, everywhere, can do a very great deal to avoid such difficulties next spring. At present the corn crop looks good and if the frosts do not come too early, there should be plenty of corn from which you can select seed.

Notice that we say you. This can very well be your job this season. Have you ever selected seed corn before? If not, begin this fall. Your father will be glad to have you do it if you know how, and that is something every fellow ought to know. This kind of work is worth while. On how well you do it depends your next year's corn crop. And while you're about it, select more seed than you will need. Some may not prove to be good when tested and if it does, you will always find a demand for it at fair prices.

What Kind to Select

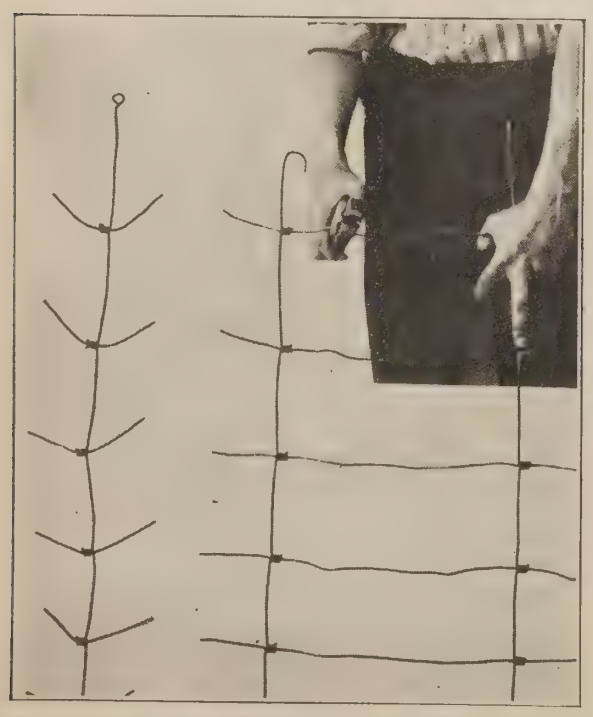
What kind of corn are you going to select for seed? There are several points to keep in mind? In the first place, don't start with the idea of picking the big ears. Ordinarily they don't ripen as early as the rest and certainly you want corn that will ripen fairly early, before the danger of heavy frosts. Select medium sized ears, not necessarily those that ripen first, but rather those that are ripe before hard frosts are due.

Those that grow too high or too low on the stalk are not desirable, and for the same reason he avoids taking ears with very short or very long shanks. He prefers an ear that grows three or four feet above the ground, one with a strong, medium length shank that just permits the ripe ear to droop enough to shed water.

In addition, select ears that are true to type, those that are good representatives of the variety you are using. If you were to look for grade Jerseys, you wouldn't select big red and white cows, would you? Neither should you select very large ears with deep, roughly dented kernels if you are looking for Golden Glow seed. Which means that you must know just what kind of corn you're after, before you start working.

One of the illustrations on this page shows a convenient way of working. An ordinary grain sack suspended from your shoulder in this way will prove a time saver.

Dry the Seed at Once



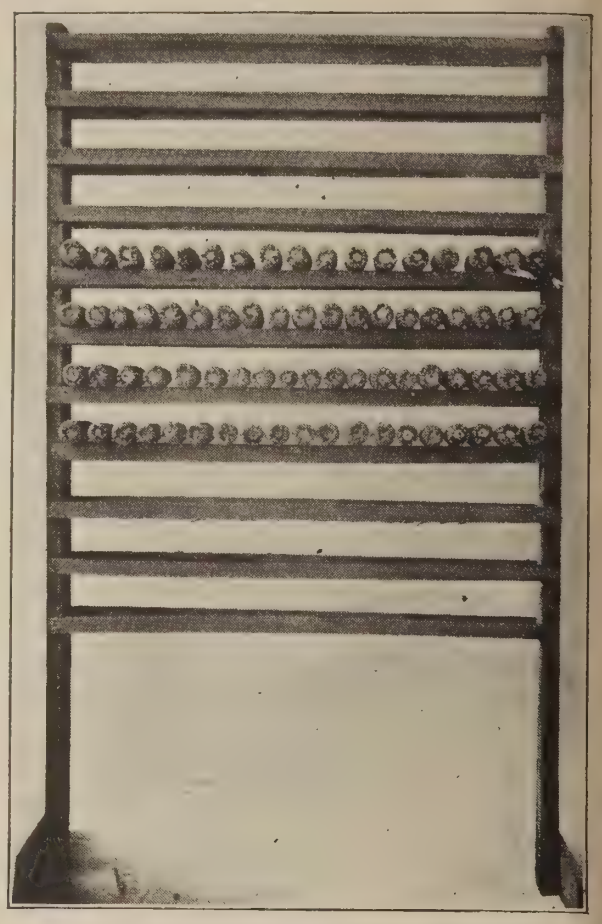
After you have picked your seed, what then? You should not allow it to be piled up on the ground or elsewhere for several days because at that time it contains 30 per cent or more of water and unless properly cared for will mold readily. The only safe plan is to hang it up where it will dry and at the same time be protected from the weather. The attic, kitchen, furnace room or a room in almost any building will do nicely so long as windows or doors are left open to insure the proper ventilation.

The man who makes a business of raising seed corn for the market very often has a special building in which to dry it and store it. There are long rows of racks for the ears and a stove furnishes the necessary heat for drying. Corn that is dried in this way with artificial heat is called kiln dried seed. For your purpose, however, the attic or a room in the tool shed will do exactly as well.

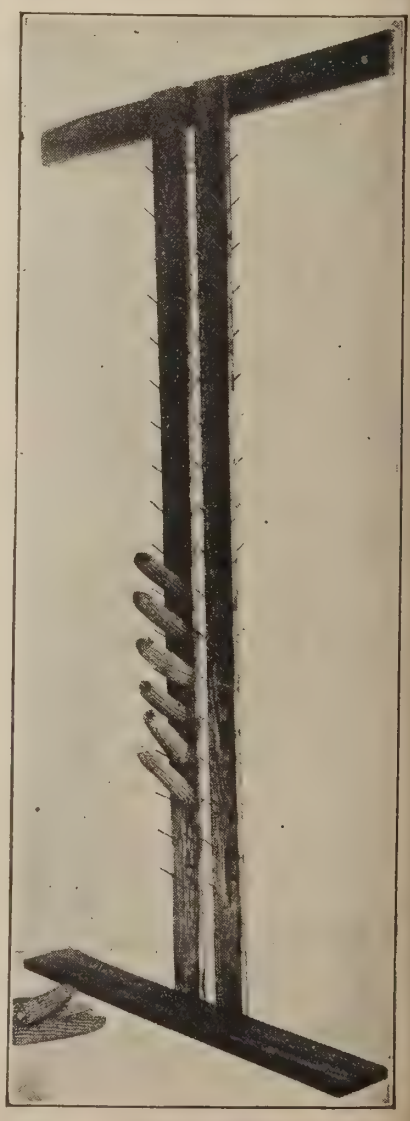
There are, however, places not fitted to the drying of seed corn and because some of them are often used it is well for us to know them. Don't try to dry your seed under the eaves on the south side of a building, on the fence or windmill tower, under the porch or in the stable. Such places do not offer enough protection.

Nor is this all there is to see to. It is not enough to have the corn stored in a room where it will dry. It must be put up on some sort of racks or hangers so that the ears will be separated. There are many kinds of hangers, so that the ears will be separated. There are many kinds of hangers, some that you can buy and others that any of you fellows can easily make, using some nails and a few old boards. Notice the illustrations on this page. Those racks or the hanger are easily made and they will do just as well as any others. Get a little old lumber or some heavy wire fencing and in half an hour you can make enough to take care of all the seed corn you will pick.

After the seed ears are thoroughly dry, store them in some dry place for the winter. If your drying racks are in the attic, you can probably leave the corn there until testing time next spring. The important thing is to get it dried early and keep it dry.



ONE KIND OF A HANGER FOR SEED CORN—ONE ANY BOY CAN MAKE—(Illinois Circular 225)



Information Wanted

HOARD'S DAIRYMAN JUNIORS:—My father takes your paper and I would like to get a little information from you. I have been raising squabs with common pigeons. They were allowed free range and picked up all their own feed. I never fed them anything except in winter. Now I want to begin with Homers, because I think they are better. I want to allow them free range after I get them used to their surroundings, that is, so they will not fly off. How should I start? Should I buy young pigeons and mate them later or should I buy old mated pairs? How old should I buy them, so they will raise squabs by next spring, that is, buying them this month? What should I feed those that I buy (1) while they are growing, and (2) while breeding squabs? I have one pair of old ones now. They are just beginning to molt. What can I feed them? In feeding, I want to feed the most economical feeds at war times, especially, but not leaving out those that are essential to bring good results. If possible, name some breeders of good squab breeding Homers.

I am interested in Hoard's Dairyman Juniors very much. I have one grade Holstein calf, a cross from a Jersey cow bred to a Holstein bull.

A RACK FOR DRYING AND STORING SEED EARS—(Illinois Circular 225)

STILL ANOTHER HOME-MADE RACK—(Illinois Circular 225)

BIG MONEY
IN "ORNERY" HORSES

MY free book will amaze you. See the big money that is being made by those I taught my famous system of horse breaking and training! Wild colts and vicious, unmanageable horses can be picked up for a song. By my methods you can quickly transform them into gentle, willing workers and re-sell them at a big profit. You can also earn fat fees breaking colts and training horses for others.

Write! My book is free, postage prepaid. No obligation. A postcard brings it. *Write today.*

I also have nine White Wyandottes, hatched May 5th, 3 pullets, and 6 cockerels (tough luck). I will close now for I think I've written a great deal already.

If any juniors know about squab raising I would be glad to have them help me out with these questions.

Wisconsin. FREMONT CONRAD.

Junior Letters

Hoard's Dairyman Juniors:—I sold my pig two weeks ago to a man down town for $5. Out of the ten there are five left as we sold them. They are growing fine.

I am milking four cows now, but one is about dry; the other one gives about 5 lbs. a day. They are going to freshen next month. My two brothers and I have one-eighth of an acre of early potatoes. I expect between 20 and 30 bushels from the piece.

We cut our barley yesterday. We have about 1¼ acres of it; papa expects about 60 bushels from it. Our wheat will be ready next month. our oats about a week from next Monday or Tuesday. We have two acres of alfalfa, two of wheat, 3¾ acres of oats, one acre of potatoes, and six acres of corn. Nine cows, one bull, one heifer to freshen this fall, one to freshen next spring, one yearling, and four calves. Also three horses and two colts, all on a 40-acre farm; also some clover and timothy.

I will close wishing the juniors good luck. My address is R. F. D. 6, Rice Lake, Wis.

Paul Krippner.

Hoard's Dairyman Juniors:—How are all the juniors today? I am fine and I hope you are the same.

We are in the testing association and our cow was the best in the association. Last month she gave 86.8 lbs. butterfat in a month on nothing but grass.

I read the junior page every week and find it very interesting. Pa likes the Hoard's Dairyman the best of all the papers he reads.

I went to the short course at the University Farm this spring.. I stayed a whole week and liked it fine.

I just got done skinning a calf which we found dead in the pasture. It was about four months old and it was a heifer. Well we are lucky; it was the smallest one and it wasn't a full blood.

I wish some of the juniors would write me. My address is Box 1, Rosemount, Minn.

Hubert Widdenbogerd.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I received my watch fob, button, and creed and I like them very much. I am 12 years old and will be in the seventh grade this fall. I live about two miles from school and have to walk every morning. Our school was out in April.

I have one brother that belongs to the Hoard's Dairyman juniors, and one sister and one brother who do not belong to the juniors.

We have 10 cows, but are milking only nine at present. They are the Holsteins. We have about four hundred and fifty little chickens this year. I own 20 of them.

We have been hoeing weeds in the corn and the kafir and cane field the last few weeks.

My letter is getting rather long so I will close for this time, wishing all the juniors good luck.

Kansas. Gertie L. Folger.

Hoard's Dairyman Juniors:—It is a long time since I wrote to the juniors, but we have been so busy with our garden and haying that I had no time to write.

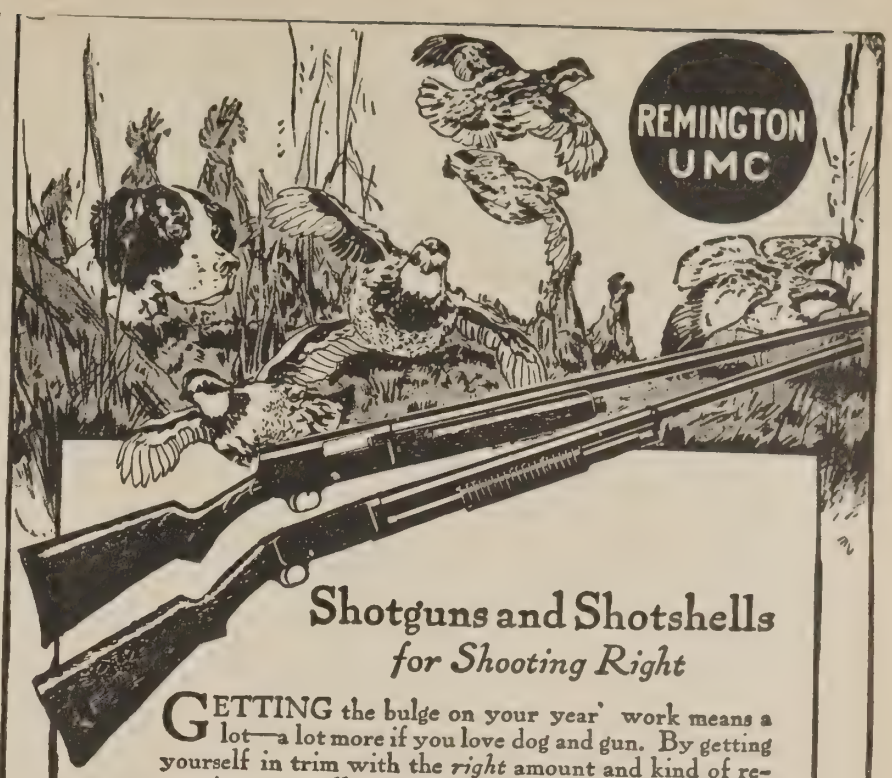
My apple tree does not bear any apples this year. Last year I got 3¾ bushels of apples. It is 5 years old.

My brother and have got one-eighth of an acre from papa which we planted into potatoes. They are looking pretty good now. We pay our younger brothers for picking the bugs off them.

I think my letter is about long enough so I will close, wishing the juniors good luck.

Minnesota. Toralf Bakke.

Hoard's Dairyman Juniors:—Please excuse me for not writing sooner, for I have been very busy this spring and summer.



You asked me about my pig and pig club. I have a registered Berkshire pig which I am going to keep for a brood sow. She was born the first of January. I bought her when she was 4 months old. I paid $15 for her. We haven't enough members around here, but I belong to the organization. I am feeding my pig now oat middlings, 2 lbs.; cocoanut meal, 2 lbs.; skimmilk, 8 lbs. That is what I give her each day. I can't get much green feed now, only a few weeds out of the garden. I keep her pen clean and lots of straw for a bed. I wash her once in a while and put on something to kill the lice.

We got our grain threshed a few days ago. Our wheat made 12 bushels per acre. It ought to have made 24 bushels per acre. Our oats were not good either. The aphis damaged our grain, besides it was a dry year.

We are milking 10 cows now. They are not milking very good now on account of a short pasture but the milk is very rich and we still get quite a lot of cream.

I guess my letter is getting long so I will close for this time wishing the juniors good luck. My address is R. 3, Albany, Oregon.

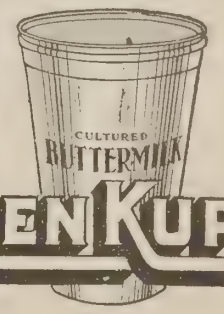
Lyle Smith.

Shotguns and Shotshells *for Shooting Right*

GETTING the bulge on your year' work means a lot—a lot more if you love dog and gun. By getting yourself in trim with the *right* amount and kind of recreation, you will tackle next year's work with more vim.

There is much additional satisfaction in store for you if you buy a Remington UMC Pump Gun or Autoloading Shotgun for your days off this Fall. When your well earned chance comes to bag some game, you will then have in your hands a gun made to shoot *right*. Guns of the same design helped win the Grand Prize, highest of possible honors, "For Modern Firearms and Ammunition," awarded to Remington UMC at the San Francisco Exposition.

The wonderful Wetproof process invented for and exclusively used in the manufacture of Remington UMC Smokeless "Arrow" and "Nitro Club" Steel Lined Shotshells, has been pronounced the greatest advance in shotshell manufacture in a decade. *These shells as now made are the first completely wetproof shells.* Another Remington UMC contribution to shooting *right*.



In *black powder*, buy the old reliable Remington UMC "New Club," now Wetproof sealed at turnover and top wad.

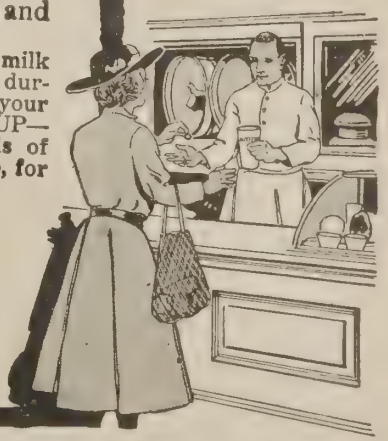
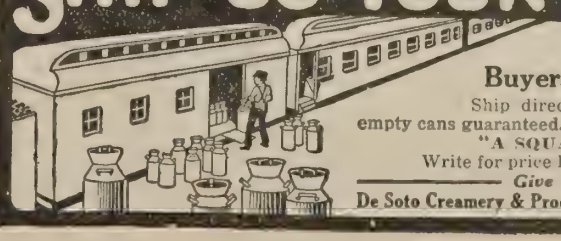
Summer Time is Buttermilk Time



KLEEN KUP

There's a booth in the Reading Terminal Market, Philadelphia, where cultured buttermilk is sold daily, direct from the farm. Crowds swarm about the counter through the long, hot summer days, slaking their thirst with this delicious, satisfying and nourishing drink.



It will *pay* you, whether dairyman or milk dealer, to make a specialty of buttermilk during the hot weather months. Serve it to your trade in the neat, appetizing KLEEN KUP—"The Package of Quality for Foods of Quality." Use Kleen Kup packages, too, for marketing fancy butter, cottage cheese, cream, etc. They are attractive, non-breakable, inexpensive. Used by over 4000 dairymen.

Look into this money-making proposition. Write us for Kleen Kup samples and the Kleen Kup story—*free*.

Louisiana Dairymen Meet

HOARD'S DAIRYMAN:—The annual meeting of the Louisiana Dairymen's Association was held in Baton Rouge, the state capital, on July 30th. After listening to a few ringing words by President W. H. Richardson, State Commissioner of Agriculture Harry D. Wilson gave a rousing talk on co-operation and organization, touching on the recently passed incorporation law passed at the last session of the legislature. This law enables the Louisiana agriculturists to incorporate as a non-stock, non-profit association under section 6 of the Clayton Amendment. Closing his remarks Mr. Wilson said: "Have a good live board of directors. Eliminate politics and get down to business. The whole thing depends upon how you stick together. Sell milk as an association, not as individuals. Find out the cost of production and fix the price accordingly."

The question of the association incorporating under the new agricultural law was discussed and unanimously passed. The name of the new association was voted as the Louisiana Dairymen's Co-operative Association, Inc. Its domicile was selected at Baton Rouge. Articles of association were then drawn up and adopted and a temporary board of directors elected as follows: J. P. Wallace, J. C. Prichard, Henry Vermeersch, W. H. Richardson, G. L. Plettinger, Frank Fargot, and J. S. West.

Other business included the appointing of Peter Fabacher of Baton Rouge to represent the association on the cost of production inquiry soon to be started by representatives of the producers, dealers, consumers, the press, and the commissioner of agriculture.

It was voted to request the Louisiana State University for a detailed report on the cost of producing milk at the University Farm near Baton Rouge. This has never been furnished the public and in view of the agitation on cost of production at this time, a great deal of assistance it was felt could be derived from such a report. After this the meeting adjourned.

Since the meeting the articles of association have been approved and filed according to law, and permission given by the secretary of state to commence business. The temporary board met at Baton Rouge to elect themselves a permanent board and adopt the by-laws voted on at the regular meeting. Officers were also appointed at this meeting. It is the intention of the association to form locals in different parts of the state and several requests have already come in.

J. S. WEST, Sec.

Every owner of dairy cows should establish a definite standard, and all cows that do not measure up to the requirements should be disposed of for beef. Whether a dairy cow should be rejected or retained should depend ordinarily on production, as shown by the milk scales and the Babcock test.

Increase Yield by Reducing Disease

In an effort to maintain or increase our live stock supplies, the reduction of the toll taken by disease should not be overlooked. There are a large number of diseases which are very common and which seriously affect the dairy industry. Among these are contagious abortion, tuberculosis, infectious garget, cowpox, cattle-tick fever, etc., which in the past have greatly reduced the milk production of our herds.

Wheat straw at $78 per ton and alfalfa hay at $88 per ton were the prevailing mid-summer prices in France.

How the Colt Lighting and Cooking Plant Differs From All Others

DIFFERENT: because there is nothing to get out of order—nothing to wear out. Farmers have used them for 14 years continuously, without spending a cent for repairs.

DIFFERENT: because it gives a soft but powerful white light—much more powerful than any other system. No matches required—simply pull a little switch.

DIFFERENT: because it is silent. If it is put in the cellar (where it can stand in the corner) you would never know it was in the house. It works equally well if put in an outbuilding.

DIFFERENT: because it runs itself. Beyond putting in a little carbide (like crushed stone) and plain water once a month, it requires no attention. The U. S. Government lights the Panama Canal with carbide and water. 700,000 miners insist on having Carbide Light to work by.

DIFFERENT: because it not only lights the house and barns more perfectly than any other system, but supplies fuel for a genuine gas cooking range—a range which will cook the meals with all the advantages of the gas ranges used by millions in the big cities.

DIFFERENT: because its first cost and maintenance are lower than any other system.

Carbide Lighting COLT TRADE MARK and Cooking Plant

"In 10 years there has not been one minute when it was not working perfectly."
D. T. CENTER

Write us today for the names and addresses of neighbors who have used the Colt double service system for years and prefer it to all others. Benefit by their experience.

TOP PRICES will prevail for many years' harvest, but the great war has drained men and animals off the farm. Replace them with a

BULLOCK CREEPING-GRIP TRACTOR

Protected by U. S. Patents

and swell your profits at the same time. Bad weather and unfavourable soil have no terrors for the British Battle Tank or for its worthy prototype, the BULLOCK CREEPING GRIP TRACTOR. Will work in ground so soft a man would mire, or a hillside so rough that the wheels of the ordinary tractor would spin and slip. The CREEPING GRIP has no wheels — it lays its own broad track and then rolls over it.

You can bank on the CREEPING GRIP doing more work than three men and six horses on any farm.

A three or four bottom tractor, depending on soil conditions. Write for catalog TODAY.

Increasing Consumption of Dairy Products

(Continued from first page.)

reached it yet. Let's look at this in a community spirit. Don't be afraid to advertise dairy products in general. It may help the other fellow, but it's bound to help you too. Look at what advertising has done for the fruit growers of California. The possibilities are just as great or greater in the dairy field. Neither is it good business for you to sit back and wait for some other fellow to advertise your wares. State agencies and the federal government have done a great deal of advertising for the dairy industry; but you are the people with the goods to sell, and your efforts should be constant and active.

In formulating advertising there are several points to remember. First, tell the public why dairy products are desirable. Let them know the food value of milk, butter, cheese, ice cream, etc. When you have done this, you have awakened interest, which is the first step.

Second, show your audience why they must have dairy products in the diet. Refer to McCollum's work which shows the presence of growth promoting essentials in milk. This sort of argument establishes dairy products as necessities.

Third, explain why dairy products have a place in the diet which cannot be filled by substitutes.

Fourth, convince the public that dairy products are worth the price. Show the relative values of meat, milk, and eggs. This appeals to the consumer's pocket book and leads him to buy.

Fifth, convince the public that the price of dairy products is warranted by the cost of production. At present this is one of the weakest links in the chain. Milk producers generally have not kept such records that they can go before the public and explain accurately and convincingly just how much it costs them to produce milk. Until they become business men they cannot hope to be placed on a business footing. Some have kept such records for a long time, many are doing so now.

The U. S. Department of Agriculture Helps

Realizing the need of stimulating dairying by increasing the demand for dairy products, the United States Department of Agriculture has lent a helping hand. A number of posters, leaflets, and pamphlets have been published and widely distributed by the Dairy Division to stimulate the use of milk, cheese, cottage cheese, etc. Some of the titles are as follows:

Milk as a Food.

The Food Value of American Cheese.

Skimmilk for Human Food.

Cottage Cheese an Inexpensive Meat Substitute.

Ways to Use Cottage Cheese.

Cottage Cheese Dishes.

Eat More Cottage Cheese.

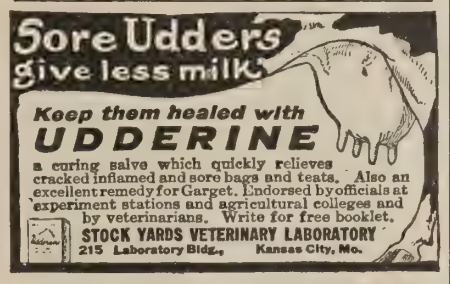
Ten Suggestions for Milk Consumers.

Over three million copies of this material had been distributed to consumers; and it has been placed before the public through the medium of city and county newspapers, periodicals, etc.

In looking over the field, it was decided that cottage cheese offered a channel through which a great deal of skimmilk could be used advantageously.

Accordingly the co-operation was secured of the States Relations Service of the Department of Agriculture and the various state extension forces. Educational work has been

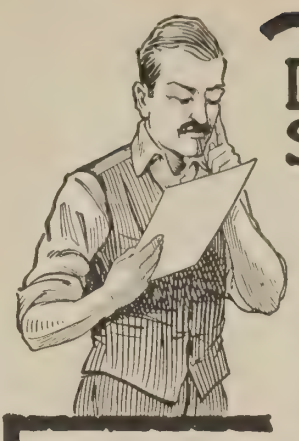
done in 40 states, largely through the instrumentality of the women home demonstration agents. This work encourages the making and consumption of cottage cheese of good quality. Over 2,000 meetings and demonstrations have been held before over 100,000 people. As a result, 41,499 persons have been encouraged to take up the manufacture of cottage cheese. Over 580,000 pounds of this valuable food have been made by these people in the short time they have been at it. They will continue and their neighbors will take it up. Commercial clubs, women's clubs, state and county food administrators, etc., have been interested and have co-operated. Not only has the manufacturing end been demonstrated, but uses in cookery have been explained. At the same time, local advertising campaigns have been conducted.

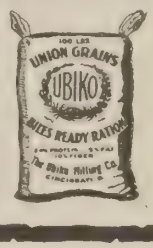


This work shows the possibilities of organized effort. American people do not begin to eat enough dairy products for their own good. Let's get together, produce the very best goods possible and then start such a well organized campaign of education that all may have the correct knowledge of milk value. Remember it took the farmers to fire "the shot heard round the world".

Securing a Stand of Clover

HOARD'S DAIRYMAN:—In the Dairyman for Aug. 23rd, you have a letter from City Farmer "How to Increase Clover". The answer you publish is good. I have found that manuring land to be planted to corn, keeping the field well cultivated, and cutting all weeds with the hoe is a good practice. The following spring, in March or early April, I disk the ground six or more times, lapping the disk one-half to keep the land level. After the last disking I take a plank drag and plank the field both ways until the land is leveled and entirely smooth. I drill in the seed with an alfalfa clover drill not over one-half or three-fourths inch deep. I drilled a little one inch deep but it did not come up as well as where drilled one-half inch deep.





I have seeded both clover and alfalfa this way early in April with the best results. I bought the best alfalfa seed I could, drilled in from seven to ten pounds of seed per acre, and got a perfect stand with fine crops of hay. After land has raised a good crop of clover and the field is rotated it is generally easy to get a stand seeded in small grain.

Laclede, Mo. F. F. D.

Sore Udders give less milk
Keep them healed with
UDDERINE
a curing salve which quickly relieves cracked inflamed and sore bags and teats. Also an excellent remedy for Garget. Endorsed by officials at experiment stations and agricultural colleges and by veterinarians. Write for free booklet.

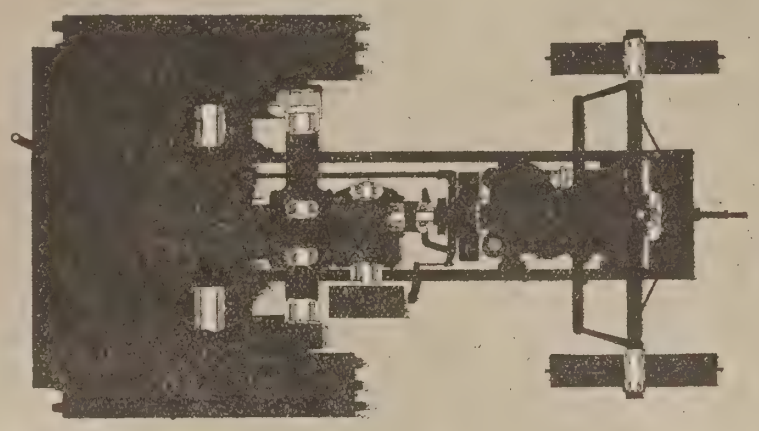
Brooks Appliance Co., 467 State St., Marshall, Mich.

Does Your Record Sheet Puzzle You?
DAIRYMEN feeding a home mixed ration are often puzzled at the varying results they obtain from the same quantities of the same kind of grains. This is because even the best and most reliable concentrates vary considerably in actual chemical composition as well as from the guarantees under which they are sold.
To secure results which you can standardize and always depend upon, you must feed a ration that is always the same, such as
UNION GRAINS
Union Grains never varies. It is scientifically mixed so as always to contain the same proportions of protein, carbohydrates, and fat.
Union Grains is composed of Fourex Corn Distillers Dried Grains, Choice Cottonseed Meal, Old Process Linseed Meal, White Wheat Middlings, Winter Wheat Bran, Hominy Meal, Corn Germ Meal, Corn Gluten Feed, Brewers Dried Grains, Barley Malt Sprouts, one-half per cent of Fine Table Salt, *and nothing else*—no filler, no weed seeds, no trash. It bulks well, is palatable, and is easily digested.

The Food Administration wants you to order your winter supply of feed now while the railroads can handle the shipments. They allow you to order a four months' supply for shipment in sixty days. Union Grains will keep indefinitely. It contains only 8% moisture. At present the price is comparatively low. Place your order at once. Your dealer has Union Grains or can get it for you. Don't accept a substitute.
You can use a new record sheet. If you have never kept one, start now. Send for the record form we have prepared for dairymen's use.
THE UBIKO MILLING COMPANY, Dep H, Cincinnati, Ohio

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID
STOP LOSING CALVES
TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.
GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.
MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City, Reference—Colonial Bank.



Summer Graining Pays Big Profits

DAIRYMEN are coming more and more to realize that feeding a good grain ration on grass is essential to making the most money out of the dairy business.
The feeding of grain with pasture is more than justified by the extra yield of milk which comes at the time the summer grain is being fed. It pays a nice margin of profit over and above what the grain costs.
BUFFALO CORN GLUTEN FEED
But the big results, the most important part of the profit, come after the cows have been taken off the grass and are in the barn for the heavy milking season, when milk prices are up.
Dairymen know from experience that they make out far better with their herd by feeding Buffalo Corn Gluten Feed now than they possibly could by not feeding it.
When cows have to fight flies and heat all day long, dusty tough grass stubble is more of an aggravation than anything else.
Men who feed Buffalo Corn Gluten Feed the whole year through are making more than a living out of the dairy business.
REFUND! Keep the branded Buffalo Corn Gluten Feed sacks together and take them to your dealer for refund.

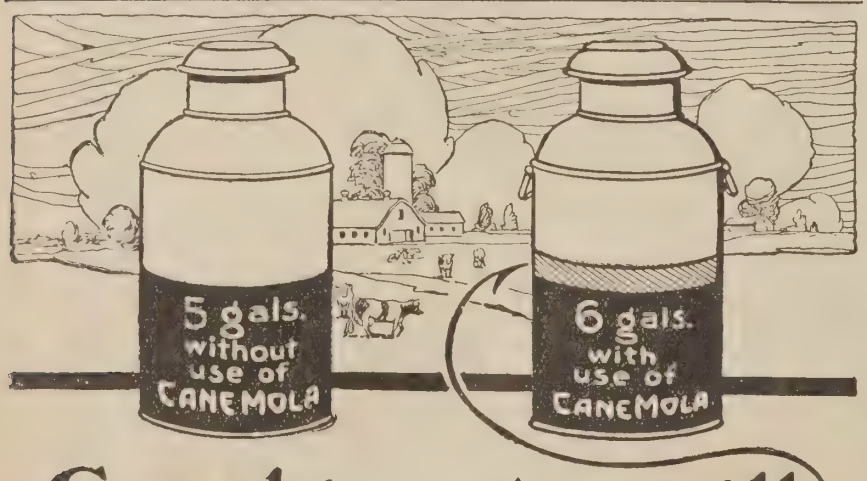
The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED

The Full Jewelled Tractor

Every one knows the value of the watch with the "Full Jewelled Movement"—it can be depended upon. In the LAUSON 15-25 we have followed the full jewelled idea by equipping it with 24 sets of Hyatt and Timken heavy duty Roller and Ball Bearings. These mean to the tractor what the jewels mean to the watch movement. They insure easy running, no friction, dependability, long life, power.

Combined with LAUSON dust-proof design—all gears enclosed and running in oil—and LAUSON rugged construction, the LAUSON owner has real tractor insurance for field or belt work, year after year.



Full particulars about the LAUSON 15-25—the economical farm power unit for all farm work—will be sent on request. Our nearest Sales and Service Station will gladly arrange a demonstration on your farm.

Get this extra milk

at less feed cost

Cane Mola will increase the milk yield of the average herd about 15%. It is NOT a mixed feed, *not* beet molasses, but 100% Pure Sugar Cane Molasses—provides fat and energy at an economical feed cost. More than half its weight pure sugar—but sells for less than corn.

CANE MOLA

makes coarse feeds succulent, makes roughage palatable. Endorsed by Government Experiment Stations. Again, it conditions cattle and keeps them in the pink of health. Use it for cows, hogs and horses—mix with grain or forage. Sold in 600-lb. barrels. Decide now to get more milk from your cows at lower cost. Write us—today.

Pure Cane Molasses Corporation

69-A Wall Street New York City

Control of all Cheese

(Continued from page 223)

for the several kinds of cheese. No licensee can pay, and no commission merchant can accept, an unreasonable commission. The dealer for whom cheese is sold must inform the commission merchant of the maximum price for which such cheese may be sold.

It is the intention of the Food Administration that cheese be kept moving to the consumer in as direct a line as possible. Licensees have been placed in three classes and the direct line of distribution is from one class to the succeeding one. Manufacturers are in the first class. The second class includes assemblers, wholesalers, and jobbers, including all licensees who receive cheese from manufacturers and grade and assemble it for sale, or who distribute it in any way except at retail, and all manufacturers who perform the services customarily performed by an assembler, wholesaler, or jobber. Class three includes retailers, hotels, restaurants, and institutions.

Certain exceptions are made in permitting sales within a class, but any transactions that savor of dealing in which a profit comes to the dealer without corresponding service will result in the revocation of his license and such other penalty as the law provides.

Whenever more than one sale in the same class is made, the seller must notify the buyer of the prior sale. Such information must be given at the time of the transaction and should be placed by the seller upon the invoice in order that there shall be a permanent record.

Some varieties of cheese, among which are Camembert, Roquefort, Italian, and Greek varieties, that are made in this country are not mentioned in these rules. They are produced in very small amounts, some of them being in the experimental stage, and are not of sufficient importance on the market to warrant the placing them under special rules, but dealings in these cheese come under the general rules in regard to excess profits.—U. S. FOOD ADMINISTRATION.

Winter Rations for Dairy Heifers

In the Missouri Experiment Station Bulletin 151, C. H. Eckles and W. W. Sweet report that in an experiment which has been under way for four years and has involved 50 heifers, it has been found that heifers receiving a ration of silage and timothy hay will be maintained but will make very little gain in weight during the winter. Gains much above the normal may be had by feeding liberally with concentrates, but this greatly increases the expense of raising the animals. Where summer pasture is relatively cheap and grain high, the economical plan is to feed the animals a ration composed largely of roughage during the winter and to keep them in a moderate condition. Under this plan of feeding a large part of the growth is made from pasture, but the animal may be somewhat slower to mature. The most practical ration for Missouri conditions is silage and a legume hay for roughage, with a grain allowance of about 2 lbs. daily.

Unfavorable rations exert a much more pronounced effect upon the growth as represented by weight than upon the skeleton growth. Unless the rations are rather extreme in character the rate of skeleton growth is not affected appreciably.

HOLSTEINS AT AUCTION

Send for information about the sales of healthy, reliable, registered cattle, held at Brattleboro, Vermont, the First Tuesday and Wednesday of every other month, Feb. 5-6; Apr. 2-3; June 4-5; Aug. 6-7; Oct. 1-2; Dec. 3-4, 1918. *Come to Brattleboro, the Holstein-Friesian Capitol of America.*
Address The Purebred Live Stock Sales Company.

A Pure-bred
HOLSTEIN
for your
HERD SIRE

Leave out of consideration the greater direct cash return and Holsteins are still the best investment you can make. Great strength and constitutional vigor make the typical Holstein long-lived, free from disease and sure to produce healthy calves.

A thirteen-year-old Holstein owned by the Kansas Agricultural College, has recently finished a year's record of 15,773 pounds of milk and 513 pounds of butterfat.

This record indicates the dollars and cents value of Holstein vitality.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Bloomingdale Herd
...HOLSTEINS...

For twenty-five years have been bred for large production and good individuality. Segis Fayne Johanna, the first 50-lb. cow, is of our breeding and made her first 30-lb. record while in our herd. Many of the large producers have been bred here. Foundation stock a specialty.
A. A. Courtelyou, Somerville, New Jersey.

Bull Calf, Born Jan. 6, 1917

Sire—Colantha Johannn Champion 45674. 39 A. R. O. daughters. Son of Colantha 4th's Johanna. 35.22 lbs. butter in 7 days, 1,247.82 lbs. butter in 365 days.
Dam—Emblaggard Colantha Mahomet 279872 by Colantha Johanna Champion 45674. Record at 2 years, 2 months, 9 days: Butter, 7 days, 14.67; milk, 346.20; butter, 30 days, 59.53; milk, 1,546.30.

This calf is three-fourths white and weighs 666 lbs. at 11 months. The price of this bull is exceedingly low. We must make room in our calf barn.
EMBLAGAARD DAIRY, Marquette, Michigan.

Cooperstown, New York.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

Absolute Dispersion

Prairiedale Farm Holstein Herd
75 - Registered Holsteins - 75

OCTOBER 3RD, 1918, DIXON, ILLINOIS

All females of milking age with A. R. O. records. All but one cow and the herd sire born on the farm.

MAPLECREST SIR DE KOL—Our present herd sire. A 31-lb. son of Friend Hengerveld De Kol Butter Boy (37 A. R. O. daughters, 5 above 30 lbs. His dam is herself a 31-lb. cow, a daughter of Pontiac Aaggie Korndyke, and from Daisy Grace De Kol 32.50 lbs. butter in 7 days, 1203 lbs. in one year.

Maplecrest Sir De Kol and 27 of his daughters will be sold.

39 cows bred to him—12 with records of 23 lbs. to 29.48 lbs. all but 3 made under full age. Also 30 of their daughters among them a 27-lb. 3-year-old, and her 4 daughters; a 28-lb. cow and her 2 daughters; a 27-lb. 4-year-old and her 2 daughters; a 26-lb. 4-year-old, four 24 and 23-lb. Jr. 3-year-olds and 4 first calf 2-year-olds with records of 20 lbs. to 22.46 lbs.

The milk of every cow has been weighed the year around since 1903. The herd has averaged 10,214 lbs. milk per year for past 4 years on twice a day milkings except while they were on A. R. O. short time tests. Send for catalogs to

Galt & Spencer, Prairiedale Farm, Dixon, Ill.

Do You Need a Young Bull?

Mutual Fobes Longfield DeKol, 82959

One of His Good Young Sons for Sale

Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters although a comparatively young sire. His sire is one of the good sons of Mooie Mutual DeKol. His dam, a daughter of Homestead Jr. DeKol (71 A. R. O. daughters), made 30.04 lbs. butter and 630.80 lbs. milk in 7 days as a Jr. 3-yr.-old. At the same age she made 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days.—(A world's record when made.)

The Dam Of This Young Bull is Monona Josephine with 31.77 lbs. butter and 616.2 lbs. milk in 7 days. She is a granddaughter of Homestead Hengerveld DeKol and Dutchland Sir Pontiac Rag Apple (29 A. R. O. daughters). The first of her daughters to be tested made 22.82 lbs. as a jr. 2-yr.-old in the month of June. Two of her sons are in service at the head of first class herds.

The Calf Himself was born March 11, '18. He's nearly half white and a good individual, one of the kind that will develop into a big, straight, rugged herd sire. Moreover, he's bred right. Notice the milk production on both sides of his pedigree.

We Have other young bulls for sale. Write today or come and see us.

MILFORD MEADOWS STOCK FARM, Lake Mills, Wis.

Ashburn Pietertje Hengerveld King

Who Wants This One at $150

A son of Sir Pietertje Ormsby Mercedes 43d 163834 whose dam, Aaggie Wayne Peep 131420, butter 7 days at 6 years 34.59, milk 657.20; butter 365 days 1250.35; milk 27,762.50. His dam at 25 months butter 16.35; milk 405.10; second dam 24. Born November 16th, 1917.

YOHN'S STOCK FARM, Watertown, Wis.

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Walcowis Farms

OFFER SON OF

IOWANA SIR OLLIE

Sire of state record jr. 2-yr.-old. Dam, a granddaughter of King of the Pontiacs and first prize winner at National Dairy Show, made 27.70 lbs. butter from 624 lbs. milk in 7 days. Best day's milk, 101.5 lbs. Calf was born April 8, 1918, is evenly marked and a splendid individual. Write now for price, pedigree and photo.

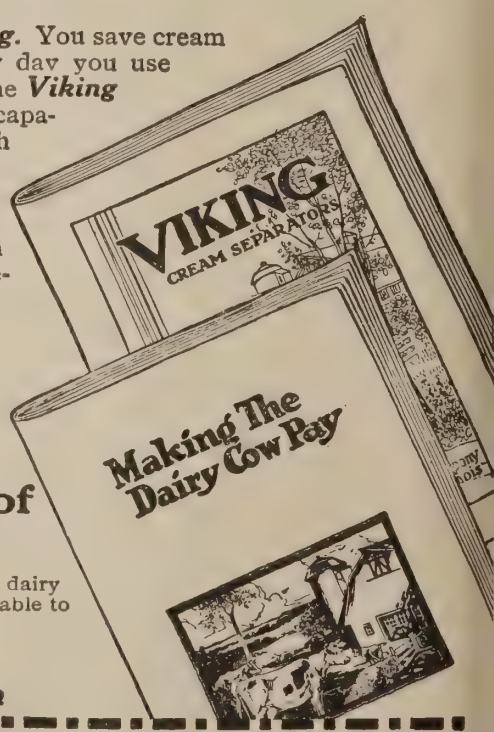
STOP Being Robbed Of Your Cream Profits!

INVESTIGATIONS covering six counties of a good dairy state prove that nearly 9 out of 10 dairy farmers are actually **throwing away $20.00 per cow each year!** They are letting out-of-date and inefficient cream separation methods actually steal away that amount of earned butter-fat profits per cow.

That's **one** of the reasons why some farmers are not getting rich!

This cream waste is something that Swedish dairy farmers would not permit. Their farming conditions have compelled them to cut out **all** cream waste. Their demand for **perfect** cream separation has produced the most efficient cream separator in the world— the ***Viking.***

Get All the Cream, Get More Profits By Using A



Over ONE MILLION In Use

VIKING CREAM SEPARATOR

Guaranteed For A Lifetime

LOWER IN PRICE—GREATER IN CAPACITY

You save money when you buy a ***Viking.*** You save cream and add to your butter-fat profits every day you use a ***Viking.*** Experts' tests prove that the ***Viking*** actually has 100 pounds of milk greater capacity **per hour** than many separators which cost much more than the ***Viking.*** Furthermore, the ***Viking*** is the closest skimming machine in existence. It is guaranteed to skim down to three one-hundredths of one per cent. In actual work it has often skimmed down to one one-hundredth of one per cent.

Made in the World's Largest Separator Factory

World-wide demand for ***Vikings*** has built up the largest separator factory in existence. 180,000 ***Vikings*** are sold every year. Each one is made of the finest quality Swedish iron and tool steel. Simplest separator made today. Easiest running; operation starts the minute you begin to move the handle. Whole bowl can be thoroughly cleansed in less than 3 minutes. See it at your local dealer's store.

These Two Free Books Will Open Your Eyes to Scores of Ways to Increase Your Dairy Profits

These two books are ***Free.*** We want you to have ***both*** of them. Read them. They show how the most successful dairy farmers are netting fat profits. Every page is packed with plans and methods and systems that have **proven** profitable to hundreds of American dairy herd owners. Just fill out the coupon—clip it off—and mail it to us tonight.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI — FORT ATKINSON, WIS., SEPTEMBER 20, 1918 — Number 9

When Aladdin Rubs His Lamp

HELEN S. K. WILLCOX, NEW YORK

UNTIL the income tax put in its unpopular appearance, an interested and credulous public was kept constantly and cleverly informed of the marvelous salaries paid the Mary Pickfords and Charley Chaplains of the screen. We were never allowed to forget for a moment that the kings and queens of the movies were paid $5,000 more or less a week for merely disporting themselves in front of the camera's eye—which news kept the "picture" fans in a constant state of envy and wonder as it was intended to do. It is human nature to be interested in successful and well known people or products.

We are decidedly interested in the screen favorites, not because they are paramount in their art, for there are many who could undoubtedly compare with or even excel them if given the opportunity, but because through the great methods of publicity we have gradually been influenced in their favor by the thought of the enormous amount of money they are supposed to earn and because their pictures, their daily doings, their public and private lives have been kept eternally before us for the one purpose of selling us themselves. When the mighty light of advertising is brought to bear upon an unknown or unpopular person or thing, that thing or person in due length of time is certain to be nationally known. That thing, if the campaign is entered upon as we are doing things today—to get the opposing forces conquered and won over in the shortest consistent time.

To be sure, it must be admitted that certified or graded or evaporated or condensed or "just milk" is no Mary Pickford or C. Chaplin. We have, rather, to be very thankful that our friend milk is something far more necessary, more real than the greatest film favorite that ever lived. Rome was not built in a day, but fame, name, market, and demand are almost created over night, as it were, by Aladdin, the Advertiser.

If you hand this modern wizard sufficient coin of the realm, he will in turn immediately rub his magic lamp and throughout America, or even the world if desired, the highways and hedges, the reading tables, the talk and gossip will announce simultaneously that Wrigley's Spearmint or Velvet are "the" ones to use in their respective classes—and like the good "follow or bust" folks that we are, everybody hustles to buy the new brand, or sing the new song, or see the new star—and somebody's fame and fortune is nicely made.

Then knowing these facts about the efficient power of advertising, why do we dairymen not get busy and hire some concern first in its line to press-agent our milk, cheese, and butter into the refrigerators and pantries of all America? We can at least talk it over here. In the first place, Aladdin the Advertiser does not perform his pleasant tricks for nothing. Oh, dear me, no! For taking our milk in hand, he would insist on a princely random to spend as freely as water. He would probably like and perhaps insist on $500,000 in which to send milk, cheese, and butter skating down the throats of the meanwhile perfectly indifferent consumer. Not but that milk and its allies are marketable enough at present, as you say, but absolutely not to be compared to what they might become if the public were taken in hand and told in highly approved advertising style to "go to them" in doubled quantity.

People who are content to stand still and make the best of an unpromising situation are not always admirable in their stand. This is a bit the place we find ourselves in today regarding the future of milk—we can take it for granted that the consumer knows best when she "gets along" with a pint of milk a day for two or a quart for six and buys "Troco" and "Just as Good" in place of butter, but it would seem rather foolish and short-sighted to allow a legitimate market to slowly decrease while we piously sit back with hands folded and murmur resignedly, "The Lord's will be done".

Such an attitude would never conquer Kaiser Bill and his minions, nor will it conquer several million housewives who have made up their minds that they may as well economize on milk and butter and put the saved pennies into the movie magnates' purse because he has told them consistently and well in the magazines, in the newspapers, in the trolleys, on the bill boards, that a penny saved is a penny gained by which to see Douglas Fairbanks or Theda Bara one more night in the week.

It has been repeated several times in history that advertising pays. The only thing or person which should beware of its clutches is he or it who cannot stand the searchlight of publicity. It would seem that milk could and should, but not spasmodically, not as an advertising rocket sent up now and then to fitfully sputter and then die out while no one's interest has been aroused enough to pay.

Supposing that it does cost half a million to make milk the successor of beer, (surely the time was never more opportune to spring nature's own food and drink in exchange)—what of it? What would a paltry half million a year amount to if rightly divided among those who would share in the future great gains—the million or two or three million dairymen themselves? Those dairymen would be few and far between who would refuse to contribute one dollar annually for the purpose of doubling or tripling a demand for their product. The very few ignorant or unarguable would never be missed for there are thousands of keen and ambitious men who would be glad of the chance to put in five, ten, or a thousand dollars for the cause because they would know what satisfying and wonderful results would ensue.

It would seem that this amount could be quickly and promptly collected at any time if the dairymen's own organizations everywhere took the matter in hand. The wonder is that we have failed to see the possibilities of regularly advertising our products for so long a time past. We would be dealing with no new forces or methods. Advertising in the American way is a tried and proven part of our every day lives and none of us can realize just how much we are led by it. Some people still think, perhaps, that advertising is merely spending money; but the money-makers, the doers, know that it is the surest way to make more and each one of them applies it in some form to their business.

There is no reason why America shouldn't be put right on the milk question and that right speedily. It is only fair that the producers of milk should also be its promoters. What we seem to lack is an organization or head to take charge and push us over the top. It would be too simple, too easy to win our public back again—and yet we linger and loiter while the substitute men are deciding that they needn't lie awake nights any more to beat us—we are already beaten.

Milk is a dry topic to dwell on alone, perhaps, but the clever advertising agency, if given rope enough, would persuade Mrs. Millionaire or Mrs. Bowery that she was hopelessly out of date and decidely un-American if she longer hesitated to demand it in superabundance.

This past year, our old friends, the Borden's Condensed Milk Company, has burst into print and prominence as never before. They must

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

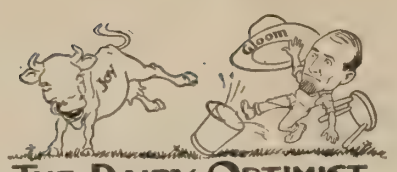
Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Wilamette Valley Notes



HOARD'S DAIRYMAN:—Old timers in the Wilamette Valley agree that the past season has been the driest one since the Civil War. A newcomer here would be alarmed at the crop prospects about the Fourth of July. Even some old residents when they saw that the hay crop was lighter than usual and the pastures were drying up earlier than commonly, sold off surplus young stock and then began letting some of their cows go to market. Rain came in time to help out corn and potatoes; winter grain got moisture enough from that stored up from the winter rains.

Feed and hay are both high. The largest hay dealer of this section, who is buying now and storing it, predicts a price of thirty-five dollars a ton next spring. Under these circumstances one can not blame some of the dairymen for selling their cows, but where they can get others to replace them later will be hard to tell.

The past season has shown the value of good cultivation. I have noticed some fields of spring grain that were put in as carefully as a garden and will give a splendid crop. And the same is true of the potato fields and the corn fields. It is quite probable that another year more fodder corn will be planted to help out the pastures and if there had been more silos it would have helped to save some herds that have been depleted.

Oregon. CLEON J. EMERY.

On account of the present emergency it is particularly important that good dairy bulls should be utilized to the fullest advantage, for more can be accomplished in increasing milk production and making it more economical in this way than in any other.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Hour of Reckoning

I sometimes think it's very hard;
This fussing daily with the herd.
I look with growing disregard
Upon each optimistic word.
And then, on Saturdays, when I
Get out my little writin' pad
And figure up, I soon learn why
It's worth th' worry I have had.

The doctoring—the sleepless nights;
The raising of the endless crops.
The bugs and blunders and the blights!
The constant care that never stops.
But, once a week, book-keeping shows
That it is more than worth th' care.
That bank account—it grows and grows!
I guess I'm pilin' up my share.

Most all of us are prone to grunt
At tasks our life-work brings about.
Whatever is the chosen stunt,
We growl and grumble, cuss and doubt.
But, if we go about it right,
And have the proper sort of stock,
We win a battle for each fight,
And land as solid as a rock.

"Somebody has figured out," said Old Uncle Whitseed of Hilcrest Dairy, that it takes $1,458,041 worth of twine to tie up the year's wheat crop in Missouri. Gosh! they must be glad they don't have to use rope!

"What sort of folks live in that farm over there, little boy? Are they worth much?"

"Yes, sir, they come from pure Ayrshire an' Holstein stock, an' have fifty of 'em."

Observations of the Old Dairyman

"Lilacs and Florida water is all right but my favorite perfume is creosote, especially when my fence posts are startin' to decay."

"I've got a corn crib and granary that is full of 7,800 bushels of corn and 7,200 bushels of small grain. Makes me feel as if I was president of a bank every time I enter th' door."

"We have a Dairymen's Club in our section. When they start arguin' I wonder why they call 'em 'Get-Together' meetin's."

"And after we get through fighting th' Hun, I'm for startin' in on them fellers what is makin' these cheap, no-good butter substitutes."

Respect for His Herd

"Dairyman Higgins got in bad with his rich uncle from St. Louis, that visited him last week."

"How was that?"

"The old gent asked to look over the family album. Higgins handed it to him, and it was full of photygrafs of his prize cows."

His Redeeming Trait

The hired man, Jim, is mighty slow,
You have to jaw to make him go.
He gets up late and eats a lot.
And slacks at work when it is hot.
He's not a born man with a cow,
And, gee, he simply hates a plow.
But—I'll forgive th' chores not done.
He wants to see us whip th' Hun.

The hired man, Jim, would rather snooze
Or search th' village through fer booze.
He flirts with every country maid,
And churns in fancy duds arrayed.
He keeps our kitching working nights,
On chicken fried, this man delights.
But—all his vices seem as none—
He wants to see us whip th' Hun.

My dander up, I say to him:—
"Get busy, help at milkin', Jim."
But he takes twice as long as me
To milk a Holstein happily.
Th' silo job is not his style,
He'd rather sit than walk a mile.
But—bless his heart! He's got me won;
He wants to see us whip th' Hun.

Eight Good Reasons Why You Should Buy a

DE LAVAL
CREAM SEPARATOR

GREATER CAPACITY: New capacities have been increased 10%, without increase of speed or effort required in operation.

SKIMS CLOSER: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

EASIER TO WASH: Simpler bowl construction and discs caulked only on the upper side make the bowl easier to wash.

EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

THE MAJORITY CHOICE: More De Lavals are sold every year than all other makes of separators combined. More than 2,325,000 are in daily use—thousands of them for 15 or 20 years.

TIME TESTED: The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for 40 years the world over.

EQUIPPED WITH SPEED INDICATOR: Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed, full capacity, thorough separation and uniform cream at all times.

SERVICE, WHEN YOU NEED IT: The world-wide De Laval organization, with agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

Necessity of Dairying During the War

OSCAR ERF, Ohio

THERE is undoubtedly no food so essential to the development of mankind as milk. First, it is the only food which man can take from infancy and produce growth to maturity. Second, milk if taken in liberal quantities is the greatest disease resisting food found in the entire category of foods; and third, it is one of the most economical of all foods.

Increased crop production which is now of so much importance depends to a very great extent upon the dairy business. The dairy cow not only supplies food direct, such as milk and its products, but she furnishes a large amount of beef and is indirectly responsible for pork derived from skimmilk and for increased crops of wheat, corn, oats, and hay brought about indirectly by the use of manure from the cow.

It has therefore been our conscientious aim, and every effort has been exerted, to develop the dairy business and while there have been a great many obstacles to hinder the progress of this splendid industry, probably the greatest one has been the increase in price of all commodities entering into the cost of milk production without a proportional increase in the price paid for milk. At the present time the average dairyman is probably satisfied when he receives the cost of production.

Increasing Costs of Production

There have been cow testing associations in Ohio for the past nine years and for ten years figures have been kept on the cost of milk production. These figures have always been high in comparison with those repeatedly published and for that reason we have hesitated about giving them out, for fear they would be considered overestimated and so do more harm than good. But constant dissatisfaction on the part of milk producers caused us to search for a remedy for the situation. They were urged to keep better cows but gradually the various items that enter into the cost of milk production advanced so much that finally even the best cows proved to be quite unprofitable for milk production in the average herd. The only way by which the dairyman could figure a profit was to place an inflated value upon the manure and increased values upon the breeding operations.

We realized that there should be no decrease in production, especially after the beginning of the war, and that some method had to be devised by which the business could be placed on a sound financial basis, which would mean that from 70 to 80 per cent of the producers must find the business profitable.

During this time the consumption of milk was apparently decreasing; the margin of profit to the distributor was so small and the producer was suffering constant losses, so that there was no chance to advertise dairy products and inform the public of their value. Other food products were heavily advertised and in spite of the fact that the price of butter was low, oleomargarine was making terrific inroads in the butter business.

Organization Results

In Ohio an attempt was made to organize the distributors with the hope of preventing disastrous competition, arriving at uniform methods of payment, and finally protecting their own business by protecting the producer. The buttermakers likewise were organized but little could be done. Then an attempt was made to organize the producers that were supplying particular markets into larger groups. Already there were small local organizations in various parts of the state and the work of organizing was taken up with considerable enthusiasm. This soon resulted in certain demands upon the distributors, who for the first time felt that they were being dictated to and in some cases opposed the organization. But the distributor and manufacturer who could look into the future realized that if there was no increase in the price of milk his business would be virtually ruined in a short time, and that in order to make it a success there must be a small margin of profit both for the producer and the distributor with enough additional profit to permit advertising the product and stimulating consumption.

There are some conditions under which the business can never be made profitable and the public should not be expected to pay a price which will justify a profit in every dairy. It is a well recognized economic law that the price of milk should be regulated by the degree of consumption. When there is a shortage of milk the price should advance to the point which will meet the cost of production in even the most poorly managed dairies; while in the time of surplus the price would be so low that only the best of dairies would be receiving cost of production. This means that throughout the year an average of approximately 78% of the dairymen would be receiving production cost.

Two Viewpoints on Labor Values

Dairymen must be educated regarding labor values and the methods of estimating costs. A comparison of two men's ideas of the value of labor will give a clear conception of this point. In what was considered an extremely successful dairy center by reason of the fact that the dairies were large, the barns well built and spacious, the homes beautiful, and the farms in a high state of fertility, there was a small organization of dairymen. Mr. Knabenshue, the president of the association and the most progressive dairyman, was the leader of a discussion on the cost of production. After taking the association figures as to the quantity of feed fed and the amount of milk produced and adding to this the overhead, it was found that they were producing 100 pounds of 3.5 per cent milk at a cost of $2.72 and were selling it for $2.10. It was suggested that these figures conflicted with their claim that they were producing milk at a profit. Mr. Knabenshue explained it as follows:

"We folks live out here on these farms and the best way to amuse ourselves is to work. We have formed the habit of getting up at half-past four in the morning and as it is useless to go to the fields before seven, we utilize the early morning hours for productive work, instead of wasting them as most city people do. The same is true in the evening. We exercise in this way rather than to waste our energies in running after a golf ball. For this reason we figure this as clear gain and do not figure our labor at the regular price. Furthermore, this kind of work makes men and women of our boys and girls and teaches them to be industrious, frugal, and economical. A good, frugal man in the country can oftentimes accumulate money enough to buy a farm, when receiving one dollar per day, while many city men go broke on $10 per day. It is just a question of management. Furthermore, we feel that we are doing as much to help win the war by producing food in this manner as though we were buying large numbers of liberty bonds. Real, genuine patriotism can be shown in this way as much as in any other."

Contrast his statement with that of a man in the plumbing business—Mr. White, who is the leader of an organization of plumbers. Mr. White informs us that no man ought to work longer than eight hours per day; that he should have at least six hours for recreation, in order to make life worth while. Seventy cents per hour is a very reasonable wage and is necessary in order to keep a man's family in just comfortable circumstances.

There is a happy medium between these two extremes and to find this average is an important problem. Today, education is the biggest problem that is confronting the dairy leader and this process of education

Great Records and Persistency

SPERMFIELD OWL'S EVA, OWNED BY MERIDALE FARMS, NEW YORK

THE question as to whether a cow can retain her milking qualities after having made a great record is once more answered by a famous Jersey, Spermfield Owl's Eva. This cow has not only made one record worthy of note, but has made six records that stamp her as an animal of exceptional merit. Her performance closely rivals that of Sophie 19th of Hood Farm in total production, and both of these animals hold honor places to be occupied until at least such time as the practice of testing cows for "long distance" production becomes more general.

There is, at the present time, a shortage of records that demonstrate the staying power of great test cows and this quality is of utmost importance to the farmer who not only milks a cow for short tests, but who is forced to get his living from cows year after year. A few Jersey breeders have realized the opportunities that lie ahead for this breed when its persistency has been thoroughly impressed on the public mind. Their untiring work and unrelenting patience to wait a number of years for cumulative results has not only been profitable to them, but to the Jersey breed.

The close relationship in the records of Spermfield Owl's Eva and of Sophie 19th is all the more interesting because both of these animals represent entirely different lines of breeding and also because of the fact that both animals are of about the same age and still on the active service list.

Both cows were at the last National Dairy Show and "Eva" won second prize in the Register of Merit cow class. They finished their latest tests within a few months of each other and their trips on the show circuit did not impair their work, which speaks volumes for their vigor and constitution at a rather advanced age.

Spermfield Owl's Eva's Record			Sophie 19th's Record		
Milk Lbs.	Fat Lbs.	Age Yrs.	Milk Lbs.	Fat Lbs.	Age Yrs.
8,947.0	511.80	3	7,050.2	395.9	2
10,859.9	597.10	7	9,924.8	570.8	3
16,457.4	933.30	8	14,373.2	854.4	4
11,666.8	709.61	10	15,099.4	931.9	6
13,114.4	740.65	11	17,557.8	999.1	7
15,504.2	833.72	12	11,915.4	680.5	9
			15,948.2	847.8	11

Spermfield Owl's Eva, in her best year's work, made 993 pounds of fat. Sophie 19th, in her best year, made 999 pounds of fat. The latest test in each case is the second best record that either of these cows ever made. The six years' total for Eva is 76,549.7 pounds milk and 4,386.18 pounds fat, while Sophie 19th in her first six tests made 75,920.8 pounds milk and 4,432.6 pounds fat. Sophie 19th has made one more yearly record than her opponent, however. It is said that both cows are in remarkably good condition at the present time and fit for a still greater length of service.

Spermfield Owl's Eva cannot be classed as a sport, nor is her great productive ability or her fine type an accident. Her sire is the great Jersey bull Spermfield Owl, who has forty-nine daughters and six sons in the Register of Merit. She also has illustrious grandparents, one of them being Exile of St. Lambert, the sire of ninety-four tested daughters.

The owners of this great cow, Meridale Farms, New York, are to be congratulated upon the making of such a good record, inasmuch as such tests are the means of putting information before the public that is of pronounced value in determining the true worth of dairy stock.—A. L. Tichane, Extension Dept., A. J. C. C.

Minnesota State Fair

THE 1918 Minnesota State Fair fulfilled its mission and fully justified its being held at a time when the utmost is demanded of the farmer. His hours were well spent if he but takes to heart the suggestions and lessons which were offered in good numbers in an attractive, understandable way. The whole fair was a food production and conservation program. It was a "food fair" in fact.

One hundred and sixty thousand people entered the gates the opening day of this year's fair, held September 2 to 7. Succeeding days continued the precedent thus set of breaking previous records for attendance. The patronage serves well as a measure of the excellence of the exposition. Old-timers declared it to be unsurpassed in the fifty-nine which have been held, and followers of the western circuit gave it rank as "the greatest fair we have ever seen".

Twenty-six million, five hundred thousand acres of the Gopher State are in farms. Their total production gives her rank among the states as first in barley, second in wheat, third in oats, rye, and flax, tenth in corn, and first in butter. A census of her farm animals shows her to be an unusually "live" live stock state, 1917 showing an increase over 1916 of 140,000 cattle, including 26,000 dairy cows; 27,000 sheep; and 165,000 hogs —a total of 358,000. Predictions are that 1918 will show an equal increase over 1917. Her 1,300,000 dairy cows, scattered on 135,000 farms, supply the product of over 900 creameries, 646 of which are co-operative. In 1917 these dairy cows produced fat for 132,390,172 lbs. of butter, more than was manufactured in any other state, and in this "the bread and butter state of the Union" returned more wealth than the entire wheat output of the state, bringing to her caretakers about $100,000,000. These facts laid before those who leave their farms at this season enlighten and encourage them to continued effort. From statistics of what is already being done comes a vision of the unlimited possibilities for food production which further development will open up in Minnesota.

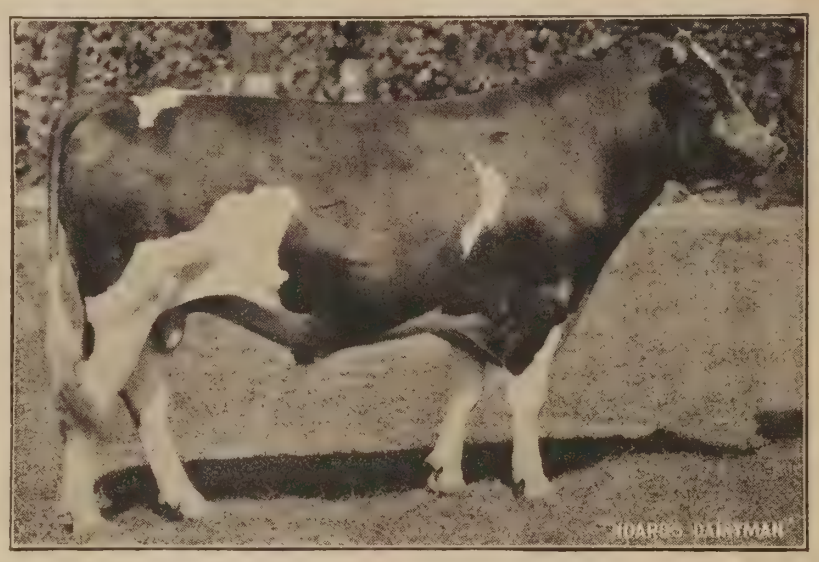
Signboards about the grounds directed the attention again and again to the text of the fair, "food conservation and production". An instructive exhibit by the State Food Administration graphically illustrated the importance of milk as food and of consuming increased quantities of it as a health insurance and as a substitute for scarce foods. The necessity of gathering seed corn early and of increasing cereal crops and potatoes was emphasized. In no way could the smallness of our food sacrifices, as compared with those of our allies, have been shown better than in an exhibit, "Let's divide", which presented life size figures representing the several allied nations and seated at a table with their typical amount of food before them. "Columbia's" share appeared liberal indeed —perhaps selfishly so. The kinds of meats needed for the army and navy were shown with those which may best be consumed at home, attractive sugarless pastry was exhibited, and concrete illustrations were made of the immense saving in food which may be accomplished when each saves a little.

The entire food conservation exhibit was practical and praiseworthy.

The Allied War Exposition showing many trophies was given much prominence. On Monday more than 15,000 paid their "two bits" each to see guns, shovels, machine guns, etc., brought from the battlefields of France. A United States government exhibit, given liberal space in the horticultural building, where there was not room for all those who desired to show products, was almost equally popular. Nine military aeroplanes flew three different days, a formation of six in flight proving a special attraction.

A butter statute of an American eagle in flight with its talons firmly fast in a butter figure of the Kaiser drew many an interesting comment from visitors to the dairy building.

The title, "Our Dove of Peace", seemed to fit the expressed sentiments admirably. The Dairy and Food Department presented with the "Dove" a well arranged assortment of foods with food values equivalent to that of a quart of milk. A goodly number of bottles of milk had been taken from the wagons delivering in the Twin Cities, scored, and placed on exhibit. Enough low scores were found to serve as a caution to the dairy farmers to improve the quality of their milk.



Two hundred fifteen entries of butter and 28 of cheese made up a good showing for dairy products. The quality was uniformly high. O. O. Vaughan won in the gathered cream class with a sample scoring 96.5 per cent. Leo Von Ark was awarded first on a sample of cheese with a score of 97 per cent.

In the Dairy Building also was an "Eat more milk" exhibit put up by the Minnesota Dairy Council. Enlargements of pictures of some of Dr. E. V. McCollum's laboratory animals were used to drive home the fact that milk has special nutritive qualities and that it contains absolute essentials to the health of young. A mounted figure of a cow was used in the exhibit booth with the inscription, "Foundation of the dairy industry". Considerable publicity was given to the high quality of the butter made by Minnesota's co-operative creameries, fifty of which are contracted to supply butter to the navy.

Owned by V. S. Culver, Minnesota

Cattle Exhibit

Minnesota's dairy cattle exhibit was easily a leader over preceding 1918 fairs. It was unusual in including representations from but three of the breeds, Ayrshires and Brown Swiss failing to appear. The most pleasing feature of the showing was the exceptionally strong line-up of Guernseys. Frequenters of show rings for many years could not recall a state fair which has brought out as many of the fawn and white dairy cattle or an exhibit of as high average quality.

A characteristic of Minnesota exhibits which augurs well for the future of the state is the large number of small breeders who come out. Somewhat less than 300 cattle were shown this year by a total of 36 breeders. The strength of this fair lies in the many exhibitors who have been encouraged as beginners to fit a few animals from their small herds and bring them to the state fair for comparison with those of their neighbors.

A second movement which promises to become a strong feature is the county exhibit. There are now at least four counties which under normal conditions would compete in pleasant rivalry for the honor of bringing the largest exhibit to the fair. Breeders from Freeborn County made a noteworthy mark for their county by bringing 54 head of dairy cattle.

Holsteins

Exhibitors:—J. D. Bacon, North Dakota; Alfred Berglund, Egil Boeckmann, V. S. Culver, Mayowood Farms, Redwood Holstein Farm Co., F. S. Ruble & Sons, and A. F. Wendlandt, all of Minnesota.

Judge: H. C. Davis, Washington.

Among the nine Holstein exhibitors at the 1917 Minnesota fair was but one from another state, Brown Bros. of South Dakota. This year there were again eight Minnesota contendors but the lone venturer was "Jerry" Bacon of North Dakota. Each year the total number of animals shown approximated 100. This is the first year the Bacon herd has left its own state but the guess about the ringside was that it isn't the last. The animals were excellently fitted and shown and put up strong competition in every class they entered. They attached eleven seconds and but two firsts, but made one of the latter good for a senior and grand championship.

The scale of Johanna Ondine Grahamholm Lad, an aged bull weighing 2,600 lbs., gave him sufficient advantage over Bacon's son of King Segis Pontiac Count, King Watson Segis Star, a 3-year-old, to give him the lead among the aged sires. The Grahamholm bull lost in the championships to Sir Pontiac Ollie, a straight topped, deep, well conditioned two-year-old among the North Dakota entries. His finish, stronger chest, and width and levelness of rump were points to his advantage. He was later popular as grand champion over Grahamholm's senior yearling junior champion, Johanna Glenda Lad.

F. S. Ruble & Sons won in the aged cow class with Josephine Pietertje DeKol Galis which had dropped a calf the opening day of the fair. Her udder quality was hardly normal but her scale and depth gave her warrant to the blue. She had a cow of splendid quality and lines and a superior udder against her, Lilac Hedge Bismarck Colantha, from Bacon's herd. The latter, for a four-year-old, hardly had sufficient size to make the decision close, however. Boeckmann won

among the three- and two-year-olds with Aaltje Korndyke 2d and Jessie Tritomia DeKol 4th, respectively, the latter heifer having enough finish and advantage in lines to make her senior champion over the aged cow. V. S. Culver exhibited only 6 head but won two firsts, two seconds, a third, and junior and grand champion. His junior yearling heifer, Pelagie Wayne Rag Apple King, chosen by Judge Davis to lead all the females, was pronounced one of the best the judge has seen and was praised by him as being an animal practically "unbeatable".

The list of awards follows:

Bull 3 years or over—1, Mayowood Farms on Johanna Ondine Grahamholm Lad; 2, Bacon on King Watson Segis Star; 3, Wendlandt on Joe Oak DeKol Fobes. Bull 2 years, under 3—1, Bacon on Sir Pontiac Ollie; 2, Mayowood Farms on King Aaggie DeKol Grahamholm. Senior yearling—1 and 3, Mayowood on Johanna Glenda Lad and Mercedes Ondine Jewel; 2, Ruble on Nockdair King Segis Combination. Junior yearling—1, Mayowood on Ondine Cornucopia Posch; 2, Bacon on Lilac Hedge Sir Colantha; 3, Redwood on King Colantha Ormsby Boss. Senior bull calf—1, Berglund on Nockdair King; 2 and 5, Bacon on King Segis Star Aaggie and Colantha Zubrod Segis; 3, Mayowood on Ondine Colantha Hazeltine; 4, Ruble on Prince Colantha Ormsby Korndyke. Junior bull calf—1, Mayowood on Ondine Homestead Posie; 2, 4, and 5, Culver on Fair Oaks Sir Grace Homestead DeKol, Fair Oaks Sir Pauline H., and Fair Oaks Sir Grace Homestead; 3, Bacon on Lilac Hedge Pontiac Colantha.

Cow 4 years or over—1, Ruble on Josephine Pietertje DeKol Galis; 2, Bacon on Lilac Hedge Bismarck Colantha; 3, Boeckmann on Homeland Korndyke Segis; 4, Wendlandt on Victoria Perfecta DeKol; 5, Mayowood on Mayowood Fernwood DeKol. Cow 3 years, under 4—1, Boeckmann on Aaltje Korndyke 2d; 2, Bacon on Mercedes Pearl Elgin; 3 and 4, Mayowood on Barnes Colantha Pietertje and Pietertje Perfection Soo; 5, Berglund on Daisy Manor DeKol Beets. Cow 2 years, under 3—1, Boeckmann on Jessie Tritomia DeKol 4th; 2, Redwood on Redwood Ramona Monk Walker; 3, Berglund on Daisy Allerton DeKol; 4, Bacon on Aaggie Fay DeKol; 5, Mayowood on Ondine Inka DeKol. Senior yearling heifer—1 and 4, Mayowood on Johanna Tritomia Mercedes and Posie Homestead Ondine; 2, Bacon on Lilac Hedge Fay Colantha Bismarck; 3, Berglund on Daisy Manor Beets DeKol; 5, Redwood on Redwood Duchess Hettie Korndyke. Junior yearling heifer—1, Culver on Pelagie Wayne Rag Apple King; 2, Bacon on Lilac Hedge Korndyke; 3, Mayowood on Venus Ormsby Mercedes; 4, Ruble on Doris La Polka Boon; 5, Boeckmann on Queen Movie Segis. Senior heifer calf—1, Ruble on Florence Princess Baun; 2, Culver on Far Oaks Skylark Homestead; 3, Boeckmann on Laura Segis Ormsby 2d; 4 and 5, Mayowood on Glen Ondine Doede and Aaggie Pietertje Ondine. Junior heifer calf—1 and 3, Mayowood on Johanna Korndyke Ruth and Avanella Canary Ondine; 2, Bacon on Lilac Hedge Tekstra Homestead Prilly; 4, Berglund on Lady Jennie Champion DeKol; 5, Culver on Fair Oaks Miss Homestead Rue.

Graded Herd—1, Bacon; 2, Mayowood; 3, Wendlandt. Young Herd—1, Mayowood; 2, Bacon; 3, Ruble; 4, Redwood. Calf Herd—1, Mayowood; 2, Bacon; 3, Culver; 4, Ruble; 5, Redwood. Get of Sire—1, Culver; 2, Mayowood; 3, Bacon; 4, Ruble; 5, Berglund. Produce of Cow—1, Mayowood; 2, Bacon; 3, Redwood; 4, Ruble; 5, Berglund.

Senior and Grand Champion Bull—Sir Pontiac Ollie. Junior Champion Bull—Johanna Glenda Lad.

Senior Champion Cow—Jessie Tritomia DeKol 4th. Junior and Grand Champion Cow—Pelagie Wayne Rag Apple King.

FONTAINE'S GRAY LINNET, GRAND CHAMPION JERSEY FEMALE AT THE MINNESOTA STATE FAIR
OWNED BY C. C. WEBBER, MINNESOTA

Jerseys

Exhibitors: C. R. Brackett, H. L. Elliott, L. C. Elliott, Roger A. Fox, Norbert P. Grathwol, Walter J. Grathwol, J. W. Love, I. C. Schneider, Geo. T. Slade, C. C. Webber, C. C. Webber and Dixon, all from Minnesota, and W. H. Clark, Wisconsin.

Judge: L. S. Gillette, Iowa.

Twelve exhibitors, eleven from Minnesota, brought out 67 head of Jerseys. Not only did the breed fail to come up to the standard of its 1917 showing but it fell behind in numbers and quality, the exhibits made by the other two breeds represented. The large number of herds entered, mainly from the hands of beginners, was a commendatory feature. C. C. Webber brought Pride of L'Etacq, champion of Minnesota Jerseys by 50 lbs. fat, to exhibit in the barn but not in the ring. Her record is 12,252 lbs. milk containing 726.77 lbs. fat. Slade's Noble Prince Jolly was made

(Continued on page 276)

"STUB", A GRADE JERSEY WHICH MADE HER OWNER $108.26 IN A YEAR

"FUZZY", A GRADE JERSEY, PAID HER OWNER $.16 FOR A YEAR'S "KEEP"

NO. 16, A GRADE GUERNSEY WHICH HAS PRODUCED PROFITABLY YEAR AFTER YEAR

"Camouflage" and a 16-cent Cow

"CAN you afford to milk a cow and care for her through the year for sixteen cents?" That's the sum a Minnesota farmer profited from keeping "Fuzzy", a grade Jersey, the past year. Her product had a value of $57.89 and the feed she ate was worth $57.73. The owner had the difference, sixteen cents, for his trouble.

"Fuzzy's" herd mate, "Stub", looked very much like her and received the same treatment but she paid her owner $108.26 for feeding and caring for her. That made the case against "Fuzzy" pretty strong. She had no alibi, for the cow tester's figures couldn't well be disputed. Furthermore, "Stub" proved that the feed and management couldn't be blamed.

These two cows, with eight others, were brought to the Minnesota State Fair, September 2 to 7, that their records might warn other cow owners to look out for the "Fuzzy" in their own herds by keeping records, and to be equally vigilant in testing to discover the "Stubs" also, in order that they may be retained for continued production. The exhibit was made a prominent and valuable feature of the fair. If thousands of dairy farmers did not gain information directly profitable to their cow keeping, the fault does not lie with W. A. McKerrow and E. J. Haslerud who collected the facts from the records kept on Minnesota cows and placed the lessons where farmers might profit by the experiences of others.

"Camouflage", a cow which looked like something she proved not to be when the cow testing association records were known, was on exhibit. Her appearance indicated that her production would be liberal but the books denied that she is a profitable cow. For the association year, 1917-1918, she returned, over and above feed cost, only $3.01—less than one cent per day. Another cow of the same breeding, grade Holstein, of very much less promising appearance, returned for the same period, $116.35. She was labeled, "Better than she looks". No one could fail to be persuaded that the test is the only safe means of judging productive capacity.

"Hawkins" and "Charity" were back again this year to repeat the good service they gave in 1917, one to show what a cow ought to be, and one to illustrate very plainly what a cow should not be. Purchased at 12 years for $40, "Hawkins", a grade Jersey, has ever since proved her former owner unwise in the sale. At 17 years of age she is still a money-maker and is milking well even though her last freshening was in the fall of 1916. But "Charity" has no such record. Why her owner has kept her the past year, no one explained. She is a cross bred Holstein-Jersey and very well represents the qualities neither breed wants. She made 79.8 lbs. of fat in a year and had only $31.50 to pay for her "board and room" for the year. She used most of it herself, leaving too little as profit to encourage any farmer contemplating crossing the two breeds, to get offspring with the large milk flow of the Holstein and the high test of the Jersey, to carry out his plan.

Charts were exhibited to show larger results from the various associations of Minnesota, which, incidentally, has 22, the second highest of the middle western states.

In two herds in the Winona County Association, liberal feeding gave one member $87.72 profit per cow per year more than was secured by a neighbor who stinted his herd on grain. The first fed during the year feed valued at $61.49 per cow and reaped a return above feed cost of $161.75. His neighbor cut his cows down so that their feed cost only $46.91. He made a substantial temporary saving but his cows "conserved" also and only gave him a product worth $74.03 more than expense for feed.

In the same association the 10 poorest cows were compared with the 10 best. There was an average difference of 343.66 lbs. fat between the two lots; the 10 best had an average feed cost of $37.38 higher but also returned $182.02 each more than the 10 poor cows.

Figures were given to show that following the suggestions of the tester in making up the dairy ration in one month increased the average milk and fat production in one herd 101 and 4.43 lbs. respectively, the profit over feed cost being increased $1.68 per cow. A report from the Dover Co-operative Creamery was given which showed that though but 12 per cent of its patrons are members of a cow testing association this 12 per cent receives 36 per cent of the money paid patrons. Their cows average to return $14.19 per month, while herds outside the association average $5.95. The buttermaker credits the increase in the creamery's output, from 243,000 lbs. in 1914 to 330,000 lbs. in 1917, to the influence of the association. In one year the cows in the Dover Association raised their average production 1,605 lbs. milk and 60.7 lbs. fat and their return over feed cost, $20.27.

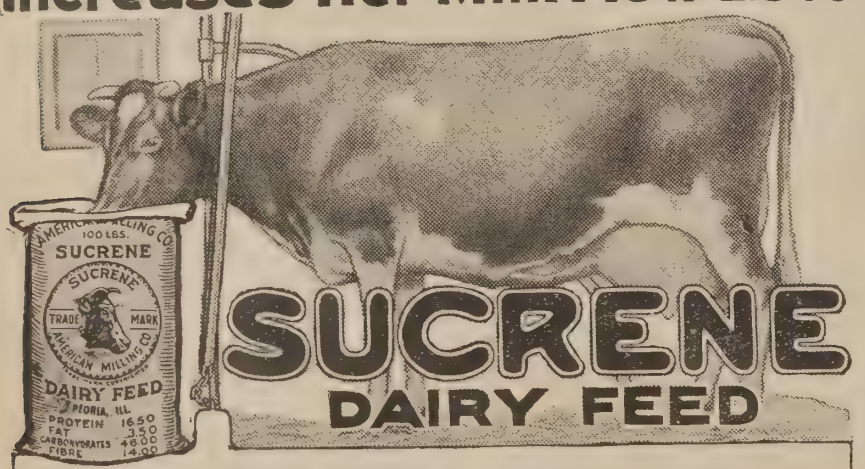
Checking an average of 130 farm separators per month, Minnesota testers found one-third of them leaving more than .03 per cent of fat in the skimmilk. Fifty-two per cent of imperfect skimmings were found to be the result of too slow turning; 11 per cent, of worn discs; 5 per cent, of poor foundations; and 5 per cent, of wobbling bowls.

Babcock Milk Tester Complete $12.00

Any Cow Owner Can Make Accurate Milk Tests With the Efficient and Simple Crepaco Babcock Milk Tester

There is nothing intricate about it—operated by hand. There is a size for every dairy, from the 2 bottle tester to the large size with 24 bottle capacity.

This tester is noiseless in operation, the high speed being attained without unnecessary friction, by means of a spur and worm gear with cut teeth. The full instructions which are supplied with each machine tell you how to make accurate milk tests.



Crepaco Babcock Tester complete with glassware as illustrated above—six bottle capacity costs only $12.00.

We have Babcock Testers as small as the 2 bottle size costing $4.25 complete with glassware.

Our big Dairy Catalog describes fully, all size Milk Testers and other appliances of value to the dairyman. Write for it TODAY.

THE CREAMERY PACKAGE MANUFACTURING CO.
68 W. Kinzie Street, Chicago, Illinois

The Poorest Milker You Own Increases Her Milk Flow 25%

SUCRENE DAIRY FEED

It Pays to Feed Your Cows a Complete, Correctly Balanced, Quality Guaranteed Ration

When a good milk cow is fed a full ration she turns half her feed into milk; when fed three-fourths of a ration she turns one-third her feed into milk; when fed half a ration she needs all her feed for body maintenance.

Sucrene Fed Cows Always Give More Milk Because They Are Properly Nourished

Sucrene Dairy Feed is a scientifically correct body maintaining and milk making ration. Its 16½% protein, 4½% fat and carbohydrates, and necessary ash and mineral matter, meet all the needs of the cow, every day, when fed only with the usual roughage. Composed of cottonseed meal, corn feed meal, corn distillers' dried grains and solubles, palm kernel meal, finely ground and bolted grain screenings, clipped oat by-product, calcium carbonate ½ per cent, salt ½ per cent.

Your cows will prefer Sucrene to any other feed because it is sweet smelling, appetizing, easily digestible, and because of its great variety of high grade feeding materials. Sucrene Feed is a complete ration as you buy it. You have no mixing to do—we have done that for you in the most perfect manner possible — merely vary the quantity in accordance with the cow's milk-producing capacity. Every sack guaranteed uniform high quality.

Reduce Cost of Milk Production

Sucrene Dairy Feed brings you more milk per dollar of feed money than any ordinary ration. It leaves your high priced grain to bring you a quick, direct profit in the market. It is an all year profit maker, keeps your cows in better producing condition summer and winter.

Order a ton from your dealer. If he can not supply you at once, write us and we will see that you are supplied. The coupon or a post card brngs you free Illustrated Literature on care and feeding of farm animals. Write for it.

Price Fixing and Cost of Farm Products

(Continued from page 86)

When the point of view in farm cost accounting is shifted from specific costs to comparison of profits, the whole problem is much simplified. In the attempt to secure specific costs, accounts had to be kept in minute detail comprehending every activity and economic relation of the farm. As soon as one shifts to the point of view of comparing the profits of competing enterprises, no record need be kept unless the farmer really has a choice and then only such records as are essential to answering the question, Does this pay better than that? For example, the farmer in Southern Wisconsin has a choice between growing oats and barley. In order to make a wise choice on this point it is not necessary to know the specific cost of growing either oats or barley. All that is necessary is to know differences in cost and differences in the value of the crops. In this case the same tools, machinery, horses, and men are used at essentially the same time of year whether the farmer grows the one crop or the other. These common items of cost may be omitted for they cancel each other in the calculation. When put in this form the question is so simple that almost any farmer can figure it out on the basis of such facts as are easily available by keeping a production record and by studying price quotations.

The milk producer has a number of ways of disposing of his product. He may sell whole milk to a city, or a condensery. He may take his milk to a cheese factory and carry home the whey or he may separate the cream and sell it for city use or to a butter factory. If the milk is marketed through the cheese factory, hog production is introduced as a supplementary industry using the whey. If he sells cream, calf raising and pork production may be combined with dairying as a means of using the skimmilk. All of these different types of dairying can be based upon the corn, oats, hay, cropping system. The combination a given farmer should choose depends upon which pays best under his particular conditions of production and marketing.

The dairy farmer has, of course, other alternatives. He can change from dairying to beef and pork production, based upon the same field crops. Again, he can abandon cattle and hogs entirely, grow grain to sell and raise horses as a side-line to use up much of the unsalable roughage, but in figuring the merits of this last system, influence upon fertility and production of grain per acre should not be ignored. He has the further alternative of trying his fortune in the city, and this horn of the dilemma has frequently been the choice.

With all these opportunities before him, the farmers are slow to shift from one thing to another in normal times because, for a given community, the question of what pays best becomes fairly well settled. Near the cities, whole milk of high quality is produced under sanitary conditions of a higher standard than in other dairy regions. Outside of the milk zone there are scattering cream shippers selected mainly with respect to the characters of the farmers participating. These are intermingled with the farmers producing for the creameries and cheese factories. The city milk zone becomes more or less well defined with the boundary line moving out a little farther in winter and contracting in summer, with a gradual expansion of the milk zone about a growing city.

But in abnormal times when radical changes are taking place in the prices of all these competing lines of production, farmers with their eyes upon the market become uneasy and unsettled in their convictions as to what to produce. The fact that the producer of city milk is getting more than he ever got before is not a sufficient consolation if he might be making more profits selling grain, hogs, and butterfat, in spite of the fact that he has gone to greater expense to equip his farm for meeting the requirements of the city ordinances. It is this unsettled condition which has given rise to the recent efforts to regulate prices.

In deciding upon a fair price to the farmer on the part of a commission the alternative choices of the farmer become the basis for a rational decision. The industry should be made attractive to the farmer if he is expected to remain in it. But what is essential to make a given system of farming attractive? Must it pay some definite labor income to each farmer engaged in it? Apparently not, for as a matter of fact men are remaining in each type of farming who are making small incomes while others are making very large incomes.

Whether or not a man should continue to carry on a given type of farming depends upon his opportunities in other lines of farming or other lines than farming. If there is no better outlook, if he is doing better than he could do any place else, he will probably continue to produce the supply for the price he can get and look to methods of reducing costs as a means of increasing profits. If there is an alternative which will pay him much better, which should he do, ask that his price be lifted to the point where his present activities will pay as well as the alternative or quietly choose the better paying activity? The answer is not as obvious as it might at first appear. Shifting is often expensive and there is usually hope that conditions will change and the old line will again pay better. It often takes a generation to build up a type of farming, and when the system becomes unprofitable a serious loss is suffered before readjustment can be made. Yet, where permanent changes in market conditions have come about, changes in farming are necessary. Where readjustments should be made it is believed that public expenditures to aid in the readjustment, especially by means of educational campaigns, may often be more desirable than price lifting as a means of making the industry profitable.

Here is work for price commissioners well trained in agricultural economics, who will ascertain the true cause of price changes, make a study of the conditions of production, and advise the farmers in making readjustments in their farm management or in standing by their old lines of production as the case may warrant. In this work the price commissioner should not forget that the well-being of the farmer is just as important as that of the consumer, and that in the long run prices should be such as will make farm work and country life attractive.

In carrying out this policy, price lifting may at times prove desirable. This is most likely to happen in the case of articles like milk for which the price is more or less influenced by custom and which is often sold at the same price for long periods and which for this reason does not adjust itself quickly enough in times of radical changes in the general price level; but wherever isolated farmers in great numbers are acting individually in selling their produce to great corporations, need may often arise for price regulation by public authority to maintain the public interest.

In deciding upon prices, both the farmer and the price commissioner should keep the long-time as well as the immediate effect in mind. It takes

decades to build up the dairy industry in a community. Equipments require time for construction. Years are required to build up good herds, and decades are required to train a whole community in the fine art of producing high class milk. When such a community is diverted from dairying to another line of production, the farmers suffer a great loss while making the change and while adjusting themselves to new lines of production, after which they may again prosper. But if the farmers are needed to produce the supply of milk essential to the welfare of the people of the city, the loss of skilled dairymen will result in a heavy loss to the consumers, who will have to pay higher prices for milk, and probably find it necessary to lower their standards with respect to quality in order to get the necessary supply.

Hence it is the long-time averages which must be considered. The records of one year may indicate that the profits would have been greater had the farmer been in another line of production, similar to that practiced outside of the city milk belt. In contemplating these figures, the farmer should look for the unusual conditions which have made this true. If the conditions are temporary he should hold fast to his present line and recall the years when his profits were much the greater because he was in the dairy business.

If, however, it becomes apparent that permanent changes in market conditions have taken place which account for the change in profits, a move should be initiated to bring about a readjustment of the farming to suit the new market conditions; possibly some dairymen should change to other lines of production. But this is not a matter for hasty action, especially in the case of the dairy industry where public welfare is at stake and where a change has far reaching effects through a series of years.

Changes which the farmer may make in grain production or hog production may be quickly readjusted, but not so with milk production. One's ill-feelings towards other people should not enter his decision. One should not get angry and sell his herd of cows. Cold reason should form the basis of judgment. It is easy to disperse a good dairy herd but it takes years to rebuild it. A much safer plan is to cut down a little on the number of cows by cutting out the least profitable ones and plan to sell some grain or hogs in addition to milk rather than to make a radical change in type of farming.

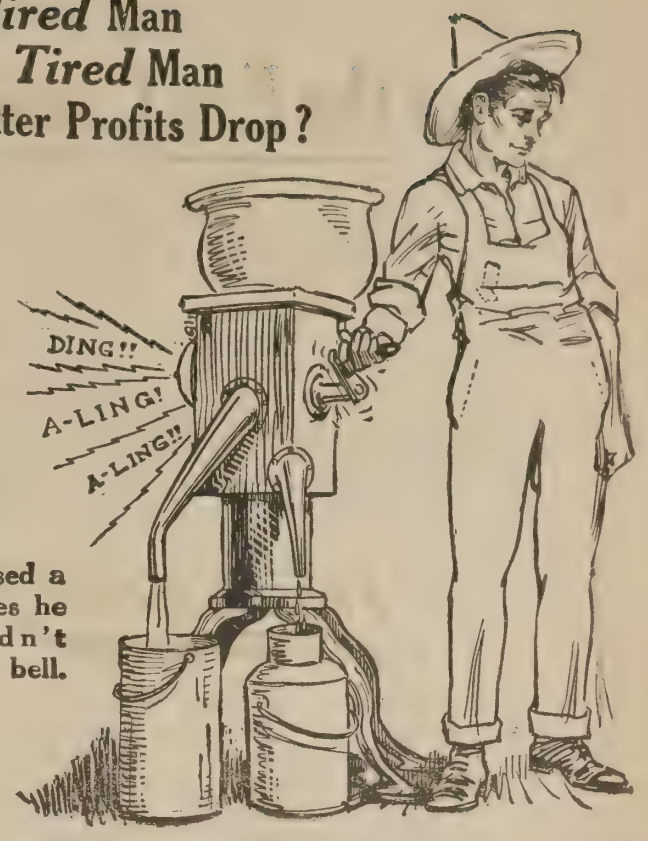
If the profits of milk production are temporarily low on a large share of the farms in a given city milk belt, due to short crops of grain and hay, which for this reason must be shipped in at heavy cost, the farmer should not only look to the long-time average, and to the maintenance of his market, but he should recognize the occasion of his loss, namely, the short crop, and he should lay this loss to the land or to the way he has handled his land and not ask that the consumer should pay the rent on the land which did not produce the feed and also pay for the purchased feed.

The farmer should not be too insistent upon the consumer's price varying exactly with his costs from season to season and from year to year. Custom is a big item in determining what people will eat. So long as prices are the same the customer is not likely to change, but every time the consumer's price changes, consumption customs are shaken; and the more violent the change the more likely the custom is to be upset. It is not only the industry, then, but the market which may be damaged by impassioned actions in times like these.

Just as it is by comparing profits that the farmer makes choice of types of farming, so it is by comparing prices in the market that the consumer makes choice. If it is done in the right way, the price of one commodity may be raised as rapidly as that of its substitute. So long as relative prices are the same the choices may be expected to be the same. If, however, much publicity of an antagonistic sort accompanies the change in the price of one article while the change in another is accompanied by shrewd advertising which wins the sympathy of the consumer, there may be a falling off in the demand of the former and an increase in the consumption of the latter.

In connection with the Chicago milk hearings the idea of comparing the profitableness of the different types of dairying was suggested, with especial reference to ratios between milk prices and butter prices, but apparently the commissioners did not see anything they thought usable in the suggestion. So far as has been noted, relative prices to consumers were not considered as a basis of price-fixing.

The farmers took the lead in the first instance, and were set upon having a price based upon specific costs. It was a very natural thing, therefore, when the commissioners despaired of ascertaining specific costs, for them to turn to a ratio between the price of feeds and the price of milk as a basis of price regulation. This resulted in the acceptance of what has been known as the Pearson formula.



One weakness of the Pearson formula arises out of the fact that the price of milk is the major factor in determining the prices of many of the articles of cow feed. The price of bran, prepared dairy feeds, or clover hay, are determined largely by the price of milk. For example, a high price of milk stimulates milk production, which stimulates the demand for feed, resulting in an increased feed price, which, according to the formula, provides for a still higher milk price. Thus started on its upward course nothing would stop the upward trend of prices excepting the lack of buyers for the milk at the ever rising price. So far as has been learned, the commission has not arranged to take all the milk which is offered at the price. On the other hand, suppose the price ratio is narrow, resulting in a milk price too low for profit. How would this affect the producers? The farmers would lose money and would produce less milk. The demand for dairy feed would fall off, and the price of feeds would fall. This, according to the Pearson formula, would call for a lowering of the price of milk which would further depress milk production and the price of feeds, and in turn the price of milk, even though the demand for milk might justify a higher price. Thus it is that the Pearson formula possesses elements of danger and will in all probability fail to serve the purpose intended.

The commission has yet the problem of price-fixing to solve. It is believed that after the excitement of the present conflict is past the commissioners will turn to a careful study of the amount and character of the milk demanded at various prices and the character and amount of milk which can be secured at these prices, and will adjust the milk price on the basis of maintaining an equilibrium between demand and supply through a long period. In doing this they will need to take into account the substitutes to which the consumer may turn, as well as profits in other types of farming to which the milk producer may later change if the milk price is fixed too low compared with other prices.

The much talked of law of supply

When the *Hired* Man Becomes the *Tired* Man Do Your Butter Profits Drop?

If he used a Sharples he wouldn't need a bell.

HE can't see the butterfat he loses in the skim milk when turning a fixed-feed separator under speed!

But it's there, sure enough, and it's represented in the lesser size of the dairy check, too.

The ring of a bell may temporarily speed him up like a spur to a jaded horse.

But it's human nature to relax when tired.

Why not have a separator *always in tune* with the *feelings* of the one who works it?

Why not have a separator that will skim clean at low speed, high speed, middle speed.

That has *clean-skim built into it!* In a word, the Sharples.

SHARPLES
SUCTION-FEED CREAM SEPARATOR

will skim clean at any speed. Tests prove conclusively that 95 per cent of all separators are turned under-speed much of the time and that's when you begin to lose cream with any separator but a Sharples. It's the wonderful Sharples Suction-feed that absolutely prevents cream loss due to turning under-speed. The Sharples bowl is a plain steel tube —no discs—therefore, easiest to clean. Write to the nearest office for catalog, addressing Dept. 10.

The Sharples Separator Company, West Chester, Pa.

Sharples Milkers—used on half a million cows daily.

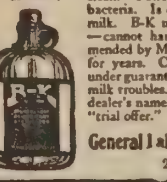
What the Eye Cannot See

Bacteria may get into milk from the stable air, but by far the greater number come from unclean and unsterilized utensils.—Farmers' Bulletin 976, U. S. Dept. of Agriculture.

Without doubt, clean utensils are the first essential in the production of milk, but when every dairyman is more or less particular in having his utensils washed the question arises as to what causes utensils to become unclean.

Rather than believe that unclean utensils are the effect of imperfect washing methods, is it not better to study the results where a special dairy cleaning material is used.



Just how thorough these results are you will readily appreciate, for the clean, sweet, wholesome, sanitary cleanliness which the use of

Wyandotte Dairyman's Cleaner and Cleanser

so easily produces is from every standpoint most unusual.

You will also observe how this cleaner protects the milk quality, and how it creates a cleanliness which gives off no odor, whether of soap or otherwise, and still further how it leaves the utensils cleaned positively free from every particle of foreign matter even beyond what the eye is able to see.

Indian in Circle

in Every Package

Why not prove this to your own satisfaction, and order this cleaner from your regular supply house. It Cleans Clean.

THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

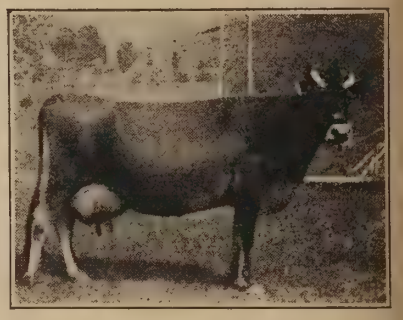
Association Notes

First Lake County, Illinois: In August market milk sold in this community for $2.75 per hundred pounds. The average test required was 3.5 per cent and for each point above, 4c were paid. The condensery paid $2.75 flat for milk and the creamery paid 47c per pound for fat. Prevailing prices of feed are: Pasture, $1 per month; silage, $6; clover hay, $28; alfalfa, $30; oil meal, $60; cottonseed meal, $64; gluten feed, $51; ground oats, $42; bran, $42; Red Horn, $65; and Grain Gold, $57.

Lake County, No. 2, Illinois: In August market milk sold in this community for $2.75 per hundred pounds, the average test required being 3.5 per cent.

Cerro Gordo Progressive, Iowa: Two separators were discarded; the skimmilk from one testing .08 and the other .2 per cent. Cows turned on clover pasture increased in milk, whereas others decreased. All herds but two now are headed by pure-bred bulls. Arrangements have been made for buying a carload of cottonseed meal. In August market milk sold for $3.00 per hundred pounds. The average test required was 3.4 per cent and for each point above 5c were paid. The creamery paid 52c per pound for fat. Milk retails for 12c per quart and butter for 50c per pound. Local prices of feed are: Common pasture, $2 per month; clover pasture, $3; silage, $8 per ton; green cornstalks, $5 per ton.

Pioneer, Minnesota: Local prices of feed are: Silage, $4; hay, $8 to $12; pasture, $1 to $2; bran, $31; oats, $37; and barley, $34.



Middlesex-Somerset, New Jersey: In August market milk sold for $2.70 per hundred pounds. The average test required was 3 per cent and for every point above, 4c were paid. Milk retails for 12c to 16c per quart and butter for 50c to 70c per pound. The local prices of feed are: Corn silage, $7.50 to $8; hay, $25 to $30; Larro Feed, $64; corn, $65; oats, $50; bran, $50; cottonseed meal, $70; oil meal, $65; Schumacher Feed, $60 to $65; dried brewers grain, $60 to $65; gluten feed, $60 to $65; Unicorn, $65.

Stillaquamish, Washington: Weather conditions favorable for good pasture have had a tendency to bring down the high price of hay. War conditions will have a marked effect on the amount of concentrates available for feed. There will be a slight shortage of milk production during the winter but a review of all conditions tends to show a hopeful outlook. During August the 480 cows under test produced an average of 655.8 lbs. of milk containing 27.2 lbs. fat.

Rice and Cedar Lake, Wisconsin: In July the creamery paid 49c per pound for fat and the cheese factory 55c, with butter retailing for 47c per pound and cheese for 24c per pound.

Wood County, No. 1, Wisconsin: The August report does not contain as many 30- and 40-pound cows as did the two previous months. This is due to the extremely hot weather and flies, and in many cases the lack of sufficient pasturage has caused a decrease. It is hoped that September will bring up a better record, as the late rains and cooler weather may revive the pastures. Several of our members siloed their timothy hay this summer and several are intending to silo their millet crops this fall. Corn in general is very promising at the present and another three weeks or so without frost will see a bumper corn crop, even though it was not planted until late in June. This surely is encouraging to us all.

Washington County, Oregon: Four

A VERMONT CHAMPION

Golden Oxford Brownie, a pure-bred Jersey owned by Quechee Fells Farm, has lead Vermont cow testing associations for the past three months. In May she produced 1,504 lbs. milk containing 82.7 lbs. fat; in June, 1,440 lbs. milk containing 90.7 lbs. fat; and in July, 1,314 lbs. milk containing 84.1 lbs. fat.

As a seven-year-old Brownie has a yearly cow testing association record of 6,873 lbs. milk containing 367.9 lbs. fat. She also has the following Register of Merit yearly records:

	Milk Lbs.	Fat Lbs.
1 year, 11 months	5,440	290.1
3 years, 1 month	6,663	306.6
6 years	8,117	499.8

cows were sold for beef. Two silos are being built. Condensery raised test on one member's milk 1 per cent, due to recommendation of tester.

Coos Bay, Oregon: Two new silos built. One new barn is being constructed. One man will arrange to flood his pasture if dry weather continues.

Smith & Umpqua, Oregon: Two separators were found to be doing poor work. Five silos were constructed this month and one manufactured silo bought. Several members of the association are planning to buy a pure-bred bull this fall.

Johnstown, Colorado: In the year's work recently completed, there were 214 cows having a full record. These cows averaged 6,300 lbs. milk containing 250 lbs fat. Nineteen cows produced over 365 lbs. fat; the record cow making 469 lbs. Five herds were sold owing to high prices of feed and labor. Forty-five unprofitable cows were sold during the year. Nine pure-bred bulls and 11 pure-bred cows were purchased.

Arkansas Valley, Colorado: There were 414 cows that completed a year's work in the association, averaging 6,109 lbs. milk containing 216 lbs. fat. Seven cows produced over 300 lbs. fat; the record cow making 12,588 lbs. milk containing 386.9 lbs. fat. Sixty-five unprofitable cows were sold to the butcher. Seven pure-bred bulls and 27 pure-bred cows and heifers were purchased.

Boulder, Colorado: The 84 cows completing a year's record averaged 6,617 lbs. milk containing 295 lbs. fat. There were 15 cows that produced over 365 lbs. fat and 18 over 300 lbs. The record cow for fat made 504.7 lbs., while the cow having the highest milk production made 14,116 lbs. milk containing 482.7 lbs. fat. Three herds were sold because of the high price of feed and labor. Twenty-six unprofitable cows were sold. Three pure-bred bulls and ten pure-bred cows and heifers were purchased.

Cohocton Valley, New York: The association has now completed its first month and is running nicely. At the present time there are twenty-five members. Judging from the results of the July work the association should do much toward improving the dairies of Steuben County. In July milk sold at shipping stations for $2.13 per 100 pounds plus 4c per point above 3 per cent. Milk retails in local urban districts for 9c per quart, butter for 45c per pound, and cheese for 32c per pound. Local feed prices are hay, $15; grain (balanced ration), $60.

Oswego County, New York: July completed the first full year for our association. Twenty dairies completed the full year. In those twenty dairies completing yearly records, 415 cows commenced the year's work. During the year 10 cows have died, 34 were sold on account of age or for special reasons, and 38 have been sold because they were not profitable. Since the balancing of the completed yearly records, 5 cows have been sold because of low returns over feed costs and in one or two cases an actual loss was shown. There are 16 more low producers on sale at the present time.

The members who are deriving the most value from testing are those who are selling all their low producers and replacing them by better ones. But if all did this where would those better cows come from? A few herds may replace their losses by purchasing good cows but mainly the losses are made good by heifers. Here is where the value of a good sire comes in and those members who have raised heifers from a good sire are now in a position to replace their poor cows with better ones. In July milk sold at shipping stations for $2.14 per 100 weight plus 4c per point above 3 per cent. Milk retails in local urban districts at 12c per quart, butter for 49c per pound, and cheese for 32c per pound. Hay is selling at $18 and a balanced ration costs approximately $60.

Canfield, Ohio: May, a grade Jersey owned by Randall Anderson, made 510 lbs. of butterfat in her last lactation period under ordinary care. This year she is being milked three times a day, along with another cow in the herd that shows fairly good capacity, and so far has responded wonderfully to the extra care, producing in 132 days 290.4 lbs. fat from 5,737 lbs. milk. The other cow, also a grade Jersey, has made 157.3 lbs. fat from 3,321 lbs. milk in 73 days. Their owner is gradually working into pure-breds as he realizes the fact that the grades are not so apt to perpetuate their good qualities.

Indiana Associations

For each 1,000-lb. dairy cow approximately four tons of silage and one and one-half tons of hay (preferably clover or alfalfa) should be hoarded up to feed between now and next spring. In supplying the necessary grain to supplement this ration a careful study of the feeds available should be made. Quotations on the various available feeds are in the hands of your tester who will be glad to assist you in planning your winter ration.

Vanderburg Association:—Although the month of July has been hot and the flies bad, the majority of the herds have shown an increase in production over the month of June. Twenty-two cows produced better than forty pounds of butterfat for the month. The highest butterfat record was 85.6 pounds. The highest amount of milk for one cow was 1,271 pounds. The past month has shown an increase in the number of members feeding grain, and also an increase in the amount of grain fed. Two members of the association are using milking machines, both members being well satisfied with their machines. Skimmilk from several separators was tested and some were found to be losing excessive amounts of butterfat. A silo and dairy tour of the county was held on the first day of August. Some of the more prominent herds and farms of the association were visited. The tour was instructive and a good time was enjoyed by all.

Clark—Harrison:—The association has completed its second month's work and there have been some very striking results obtained by better feeding. One herd of 39 cows tested, by feeding a balanced ration, saved $58 on feed in July over June and increased the profit $56.41 and reduced the average cost of producing a pound of butterfat from 53c to 25c. One cow increased her production of butterfat from 20 pounds to 39.8 pounds. Another cow increased her yield of butterfat from 17.6 pounds to 41.7 pounds or an increase of 24.1 pounds. Valuing butterfat at 47c per pound, this means an increase in income of $11.32.

Out of seventeen members in the association, ten are feeding balanced rations. Those members that are not feeding balanced rations have found a decrease in the production of their cows. Two cows from the same herd decreased 20 pounds of butterfat each or a decrease of $9.40 per cow which would pay for the feed for both cows during the month.

One pure-bred cow, one pure-bred bull, and two milking machines have been bought. One member made the statement that he received enough benefit from the first visit of the tester to more than pay the tester's fees for the year.

Warrick—Spencer:—In looking over

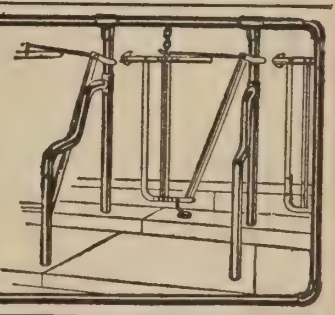
Cut Your Firewood with a Disston Buck Saw

It's the fine quality of Disston Cross Cut and Buck Saw blades that makes them eat up the timber and wood pile. They cut fast, sure and with the least possible effort. All Disston Saws are made from steel especially made for the purpose, in our own plant. The Disston Trade Mark means the same on a Cross Cut or Buck Saw as it does on a hand saw—and three out of every four carpenters choose Disston Hand Saws—famous for value for 78 years.

Disston Saws and Tools are sold by progressive hardware dealers the world over.



Send for our Booklet, Disston Saws and Tools for the Farm."

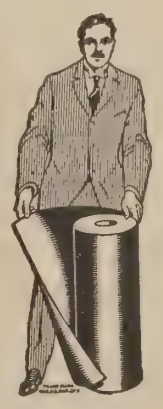
Repair with Ru-ber-oid



Economy is the watchword of the day. He is most economical who does no buying of non-essentials and who exercises foresight and care in buying essentials. To buy on the basis of price alone is not true economy.

It is essential that all your farm buildings be kept in repair. They are being used for war work and should not be allowed to deteriorate. So look to your roofs, for the roof is the most important part of a building. It protects the contents.

In repairing your roofs the purchase of a cheap grade of ready-roofing is poor economy. You get no more than you pay for. Sometimes you get less. For remember, there is more to ready-roofing than appears on the surface.

Ru-ber-oid Roofing, judging by outside appearances, is no different from many roofings which are lower in price. But the difference in price is nevertheless due to a difference in quality.

When you buy Ru-ber-oid you exercise true economy. You buy a roofing which has stood the test of over a quarter century *of service*. You buy a roofing which will give a maximum of service at a minimum of cost. You buy a roofing which will prove an asset, not a liability.

When you repair—repair with Ru-ber-oid.

Wheat Conservation Program

The recent careful survey by the Food Administrators of the United States, France, England, and Italy of the food resources of the 220,000,000 people fighting against Germany shows that, to maintain enough supplies and necessary reserves against disaster, there must be maintained in all countries a conservation of wheat flour during the coming year.

It has been agreed that the wheat bread of the Allies shall contain 20 per cent of other grains than wheat, and it is only just that we should bear our share in this saving and that our bread at least be universal with those who are suffering more greatly from the war than ourselves.

Distribution and transportation circumstances in the United States render it necessary to rely very largely on the voluntary action of our homes to enforce this mixture. The "Victory Bread" so made is wholesome and there is no difficulty in preparation. We desire to emphasize the fact that the mixtures outlined below are for wheat bread and the saving of wheat flour, but they are not intended to displace the large use of corn bread. We must use the mixture with wheat flour in addition to our normal consumption of corn bread.

For this purpose regulations are formulated below, effective September 1, providing first, for the preparation and marketing by the manufacturing and distributing trades of the country of a mixed flour complying with the international policy, which will be available for purchase by the household; second, in regulations covering the case where straight wheat flour is sold by retailers, that at the same time 20 per cent of other cereal flours must be sold coincidentally; third, requiring that all bakers' bread shall contain 20 per cent of other cereals, and the Food Administration relies upon the householders of the country to mix at least 20 per cent of the substitute cereals into the wheat flour at home for all uses. Corn meal for the use of corn bread should be purchased separately from combination sales.

Ready Mixed Flour for Sale as "Victory Mixed Flour"

It is desirable to insure a supply of ready mixed flours on the market, and to have millers and dealers of all kinds encourage the use and sale of this flour so that the country may be on a mixed flour basis without the necessity of retailers' making combination sales of flour and substitutes.

All such mixed flours made according to the following regulations should be labled "Victory Mixed Flour, and are to be labled with the ingredients in order of their proportion. The flours so mixed must be milled in accordance with the standards of the United States Food Administration. No "Mixed Flours" (except pancake flours) shall be made or manufactured except in the exact proportions as outlined below:

Mixed wheat and barley flour shall be in proportion of four pounds of wheat flour to one pound of barley flour.

Mixed wheat and corn flour shall contain the proportion of four pounds of wheat flour to one pound of corn flour.

Mixed wheat, barley, and corn flour shall contain the proportions of eight pounds wheat flour to one pound barley and one pound corn flour.

Mixed wheat and rye flour shall contain the proportion of three pounds of wheat flour and not less than two pounds of rye flour.

Whole wheat, entire wheat, or graham flour or meal shall contain

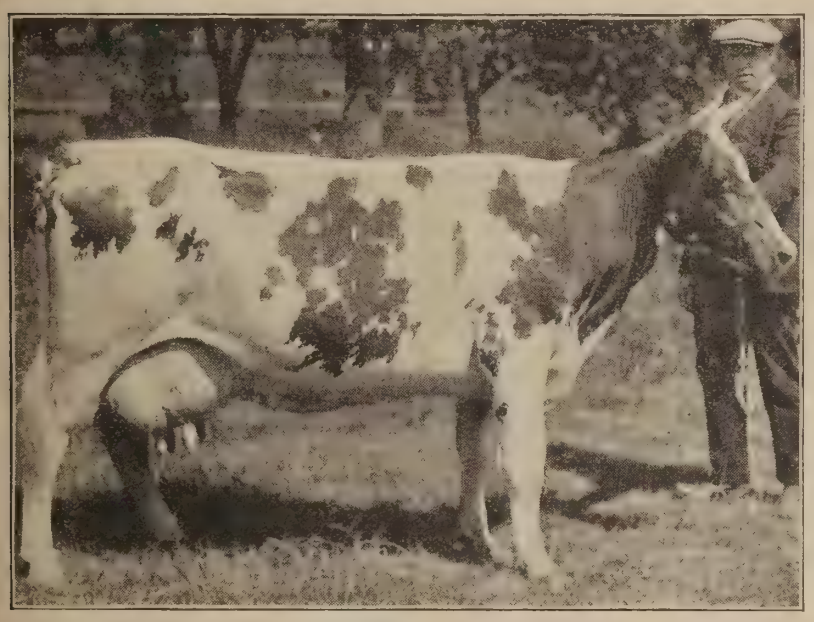
at least 95 per cent of the wheat berry.

All the above "Victory Flours" may be sold without substitutes, but at no greater price from the miller, wholesaler or retail dealer, than in the case of standard wheat flour.

Retail Sale of Standard Wheat Flour

The new regulations supersede the 50-50 rule. The retail dealer selling standard wheat flour is required to carry in stock either barley flour, corn meal, or corn flour, and with every sale of wheat flour must sell a combination of some one or more of these in the proportion of one pound of substitute to each four pounds of wheat flour. No dealer may force any other substitutes in combination upon the consumer, and these substitutes must conform to the standards fixed by the United States Food Administration.

There are some localities where other substitutes are available and which retailers may wish to carry. In order to meet this situation the following flours may be sold in such combination in lieu of the above flours if the consumer so demands, at the ratio of one pound to each four pounds of wheat flour; that is, feterita flour and meals, rice flour, oat flour, kafir flour, milo flour, peanut flour, bean flour, potato flour, sweet potato flour, and buckwheat flour. Pure rye flour or meal may be sold as a substitute, but must be sold in proportion of at least two pounds of rye with three pounds of wheat flour.



The foregoing rules apply to all custom and exchange transactions as well as sales of flour to farmers unless modified by special announcement of the Federal Food Administrator of the state where the mill is located, acting with the approval of the Zone Committee. —U. S. Food Administration.

Dairy Products on Hand

Stocks of dairy and related products in commercial channels other than retail stocks, as reported to the United States Department of Agriculture in the comprehensive food survey for July 1, 1918, were as follows: butter, 87,928,955 pounds; cheese, 85,656,949 pounds; eggs, 213,050,498 dozen; dried eggs, 9,452,913 pounds; dried milk, 12,384,444 pounds; margarine, 8,834,352 pounds; peanut butter, 6,727,220 pounds; condensed milk, 142,712,943 pounds; and evaporated milk, 203,177,023 pounds.

The figures given above include stocks actually reported as on hand by manufacturers, storage houses, and wholesale dealers and also quantities reported as in transit from these concerns. The stocks of retail dealers, as reported for July 1, 1918, are not included, since these are still in process of being tabulated. In the similar survey by the department on January 1, 1918, the retail stocks constituted the following percentages of the total commercial stocks of the commodities here considered: butter, 10.8 per cent; cheese, 12.4 per cent; eggs, 14.7 per cent; margarine, 32.1 per cent; peanut butter, 50.5 per cent; condensed and evaporated milk, 27.2 per cent.

In the case of four of these commodities, namely, butter, cheese, eggs, and margarine, the stocks reported for July 1, 1918, represent only meager increases over the corresponding stocks of July 1, 1917. In the case of the other five commodities more substantial increases were found. The stocks reported for July 1 of the present year represent the following percentages of the stocks on July 1, a year ago: butter, 102.7 per cent; cheese, 100.3 per cent; eggs, 105.1 per cent; dried eggs, including egg albumen, 244.8 per cent; dried milk, including milk powder, 178.7 per cent; margarine, including oleomargarine, butterine, etc., 107.3 per cent; peanut butter, 152.4 per cent; condensed milk, 178.5 per cent; and evaporated milk, 156.4 per cent.—U. S. Department of Agriculture.

NANCY WHITEHALL, THE AYRSHIRE COW PURCHASED BY A. HENRY HIGGINSON FOR $925 AT THE FIRST BRATTLEBORO, VT., SALE

Highest Priced Ayrshire Cow at Brattleboro Sale

Nancy Whitehall topped the first Brattleboro (Vermont) sale of Ayrshires at $925. She was consigned by Newton Farms, Massachusetts, and purchased by A. Henry Higginson, Middlesex Meadows Farm, Massachusetts.

Nancy is now on official test as a junior four-year-old and should make the four-year-old record go by if nothing happens. On the day of sale she pailed out 71.8 lbs. milk and she is a high testing animal. Her official test for May made by the Massachusetts Agricultural College was 143 lbs. in two days. Nancy has lots of milk production behind her and, with her great constitution and capacity, she should make history for Middlesex Meadows. Her grandsire on dam's side is King Finlayston, the sire of Alta Drummond of Oakdale, who made 2,140 lbs. milk, 96.2 lbs. fat in the month of May.

J. G. Watson, Extension Service.

Jersey Cattle Notes

For week ending August 30, 1918: Number of animals registered: Bulls, 240; cows, 685; total, 925. Number of transfers recorded: Bulls, 162; cows, 511; total, 673.

CONCRETE FOR PERMANENCE

Green Feed the year 'round

The Silo is no longer an experiment. Milk and meat *are* produced at less cost by feeding silage. Green feed can be had throughout the winter when kept in a properly built silo.

Concrete Makes the Best Silo

The inner surface of a concrete silo is smooth—the walls are air tight and watertight, and without joints. It keeps the silage at a uniform temperature. It is vermin-proof, rust-proof, decay-proof, wind-proof, and fire-proof. It lasts a life-time.

Use Atlas Portland Cement

for all your concrete constructions. The uniform high quality of Atlas makes it best to use.

Send coupon below for a copy of the Silo Book. It contains complete instructions for building a concrete Silo and shows the size necessary for your requirements, approximate costs, etc.

Coming Events

Iowa Dairy Cattle Congress, Sept. 30—Oct. 6, Waterloo, Iowa. Manager, E. S. Estel, Waterloo, Ia.

National Dairy Show, Columbus, Ohio, Oct. 10—19. Manager, W. E. Skinner, 130 N. Wells St., Chicago, Ill.

Farmers' National Congress meets in Jacksonville, Florida, December 3-6, 1918. President, J. H. Kimble, Port Deposit, Md.

Fitch Heads Kansas Department

J. B. Fitch has been appointed to succeed O. E. Reed as professor of dairying and department head at the Kansas Agricultural College. He assumed full charge of the department September 1.

Professor Fitch is a graduate of Purdue University, finishing there in 1910 and entering the Kansas Dairy Department the same year. He has coached five dairy judging teams with high credit and been active in other production instruction work. His investigational work with sorghum crops and alfalfa for silage is of great practical value to the dairy farmers of Kansas and other sections where the sorghums make more certain growth than does corn. Another important set of experimental studies which he has gotten under way is in the development of dairy heifers on alfalfa hay alone and on a ration made from alfalfa hay and corn silage.

The direction of the dairy herds of twelve state institutions will be in the hands of Professor Fitch. Important breeding projects are under way in these herds, by which the department will be able to render increased practical assistance to the breeders of the state.

Professor Fitch is well acquainted with Kansas conditions and adaptations to dairying. His proved ability makes his appointment a source of satisfaction to all interested in the continued advance of the agriculture of Kansas.

Harry Cave, who was graduated

PROFESSOR J. B. FITCH

from Iowa State College in 1914 and given a master's degree from the Kansas Agricultural College in 1916, will assist with the production work of the Kansas Dairy Department. Since graduating in 1916 he has had charge of dairy extension work in West Virginia.

F. W. Atkeson, who was graduated from the University of Missouri in 1918, will be given charge of the work with the twelve state institutions of Kansas.

Dairy Cattle at the Michigan State Fair

The dairy cattle show at the Michigan State Fair this year, judged by the standards of former years, was only fair. But when we consider the handicaps of labor under which farmers are burdened, the dairymen of Michigan are to be congratulated for the effort they put forth.

The dairy cattle show was almost entirely a Michigan show, but it was by no means a criterion of what the Michigan herds could do. Few of the herds were in good flesh and none were highly fitted.

It is unfortunate that modern barns and a roofed judging pavilion are not provided, for rainy days made judging difficult, but we understand that the fair board is considering the erection of a suitable barn and pavilion at an early date

The Holsteins easily led in point of numbers over the other breeds, and they presented a thoroughly creditable showing. The exhibitors were: John A. Rinke, Pontiac State Hospital, Bruce McPherson, Musolff Bros., Grant L. Carpenter, A. R. Black & Sons, and Henry J. Carpenter, all of Michigan. The four first named were very closely matched and divided the ribbons fairly evenly.

Only two herds of Jerseys were shown, those of Myrtle E. and Earl F. Pyle of Ohio and H. B. Wattles & Son of Michigan. The former, veterans of the show ring, had all the better of Wattles, but the latter had a nice herd and will undoubtedly be able to give a better account of himself as he gains experience. The Pyle herd was one of the few well fitted herds at the fair.

Two full herds of Guernseys were present, while W. S. Scripps brought one cow and her bull calf. The exhibitors were John Ebels, A. Hatt & Son, and W. S. Scripps, all of Michigan.

The feature of the Guernsey show was the cow, White Beauty of Mixter Farms, shown by Scripps. Not only was she an outstanding show cow, but she gave the lie to the statement that production and beauty do not go hand in hand. She has an A. R. record of 13,000 pounds of milk and 654 pounds of butterfat.

The Brown Swiss were represented by two splendid herds which divided the ribbons fairly evenly. They were Hull Bros., Ohio, and L. S. Marshall & Sons, Michigan.

Only one herd of Ayrshires was shown, that of Jas. Van Etta of Wisconsin. This can justly rank as one of the great show herds of the country.

Following is a list of awards:

Holsteins

Bull 3 years or over—1 and 2, Pontiac State Hospital on Pontiac Rochester Burke DeKol and Sir Clothilde Concordia; 3, Rinke on Flint Mayde Crest Butter Boy; 4, McPherson on Maplecrest Application Pontiac. Bull 2 years old—1, Carpenter on Huron Hill Canary Nig DeKol. Yearling bull—1 and 3, Rinke on Rinkland Cornucopia Butter Boy and Rinkland Johan Butter Boy; 2, Musolff Bros. on The Pastures King Segis Butter Boy. Senior bull calf—1 and 2, McPherson on Cluny Mable Colantha De Nijlander and Banostine Pontiac Aberdeen; 3, Rinke on Rinkland Butter Boy Colantha; 4, McPherson on Moonlight Colantha Geneveve; 5, Carpenter on Judge Canary Nig DeKol. Junior bull calf—1 Black on Maple Defender DeKol Butter Boy; 2 and 5, McPherson on Cluny Banostine Pontiac Frank and Dutchland Konigen Sir Rag Apple; 3, Pontiac State Hospital on Pontiac Segis Walker; 4, Rinke on unnamed calf.

Cow 4 years—1, 3, and 4, Pontiac State Hospital on Pontiac Genius, Pontiac Grace, and Pontiac Oseris; 2, Rinke on Hengerveld Pauline DeKol; 5, Musolff Bros. on Mercedes Pietertje Aaggie Texal. Cow 3 years—1 and 4, Pontiac State Hospital on Pontiac Rypster and Pontiac Julia; 2, McPherson on Vale Cornucopia Fayne; 3, Rinke on Rinkland Pontiac Colantha. Heifer 2 years—1, Pontiac State Hospital on Pontiac Cecelia; 2, Musolff Bros. on Mollie of St. Anna Butter Girl; 3, Rinke on Rinkland DeKol Pontiac Colantha; 4, McPherson on Alfadale Korndyke Hourly. Yearling heifer—1, 3, and 5, Pontiac State Hospital on Pontiac Opie, Pontiac Anita, and Pontiac Pansy; 2, McPherson on Cluny Pietertje Application; 4, Rinke on Rinkland DeKol Colantha. Senior heifer calf—1 and 5, Musolff Bros. on Aaggie Texal Segis Pieter and Buttermaid Segis Pieter; 2 and 4, Pontiac State Hospital on Pontiac Thelma and Pontiac Mildred; 3, McPherson on Cluny Pontiac Colantha Moonlight. Junior heifer calf—1 and 4, Pontiac State Hospital on Pontiac Renota and Pontiac Minnie; 2, Rinke on Aaggie Concordia Butter Boy; 3, McPherson on Cluny Application Pontiac Lena.

Exhibitor's Herd—1, Musolff; 2, Rinke; 3, Pontiac State Hospital, 4, McPherson. Breeder's Herd—1, Pontiac State Hospital; 2, Rinke; 3, McPherson. Calf Herd—1, Pontiac State Hospital; 2, Rinke; 3, McPherson. Get of Sire—1, Musolff; 2, Pontiac State Hospital; 3, McPherson; 4, Rinke. Produce of Cow—1, Pontiac State Hospital; 2, Rinke; 2, McPherson.

Senior and Grand Champion Bull—Pontiac Rochester Burke DeKol; Junior Champion Bull—Maple Defender DeKol Butter Boy.

Senior and Grand Champion Cow—Pontiac Genius. Junior Champion Cow—Aaggie Texal Segis Pieter.

Guernseys

Bull 3 years or over—1, Ebels on L'Aiglon of Bon Ayre. Bull 2 years old—1, Hatt on Funston of Thornhill. Yearling bull—1, Ebels on Olive King Duke. Senior bull calf—1 and 3, Ebels on Olive Red Rose and Olive Don; 2, Hatt on Lone Boy of Lakeside. Junior bull calf—1 and 3, Ebels on unnamed calf and Don of Olive; 2, Scripps on Oakland Squire; 4, Hatt on Lakeside Billie.

Cows 4 years or over—1, Scripps on White Beauty of Mixter Farms; 2 and 4, Hatt on Imp. Young Charming's Golden Girl and Bonnie Cleopatra; 3 and 5, Ebels on Imp. Lizette III of the Hall and Nancy of Linden Heights. Cow 3 years or over: 1 and 2, Hatt on Westmoreland Wildflower and Village Golden Hope. Heifer 2 years old—1, Ebels on Nancy of Butternut Hill; 2 and 3, Hatt on Alfa Glenwood of Lakeside and Lakeside Glenwood Rose. Yearling heifer:—1, 2, and 3, Ebels on Nettie of Butternut Hill, Rozette of Butternut Hill, and Lydia of Butternut Hill; 4 and 5, Hatt on Lakeside Buttercup and Trixie of Lakeside. Senior heifer calf—1, Ebels on Muriel of Bon Ayre; 2, Hatt on Mable of Glenwood. Junior heifer calf—1 and 2, Ebels on Lona of Hazel Bank and Princess Olive; 3, Hatt on Lakeside Bonnie Girl.

Exhibitor's Herd—1, Hatt; 2, Ebels. Breeder's Herd—1, Ebels; 2, Hatt. Calf Herd—1, Ebels; 2, Hatt. Get of Sire—1, Hatt; 2, Ebels; Produce of Cow—1, Ebels; 2, Hatt.

Senior Champion Bull—Fun ton of Thornhill. Junior and Grand Champion Bull—Ebels on unnamed calf.

Senior and Grand Champion Cow—White Beauty of Mixter Farms. Junior Champion Cow—Nettie of Butternut Hill.

Jerseys

Bull 3 years or over—1, Pyle on Angelicia's King; 2, Moore on Lonatus of Moore Farm. Bull 2 years—1, Pyle on Sans Alois Niece's King; 2, Moore on Rosy May's Major. Yearling bull—1 and 2, Pyle on Financial Richmond and Rosa San's Aloi K; 3, Moore on Queen's Decoration. Senior bull calf—1 and 2, Pyle on King's Rosa's Sans Alois E and Financial Mary's Sans Aloi; 3, Moore on Jap Girl's Captain. Junior bull calf—1, Pyle on Stockwell's Niece's King; 2, Moore on unnamed calf.

Cow 4 years or over—1 and 2, Pyle on Sultan's Eminence and Stockwell's Angelina; 3, 4, 5, Moore on Zenda of Moore Farm, Lona of Moore Farm, and Queen of Moore Farm. Cow 3 years old—1 and 4, Pyle on Financial Mary K and King's Column Vine F; 2 and 3, Moore on Rosa May's Barbara and Rebecca's Lady Jap. Heifer 2 years old—1 and 2, Pyle on Financial Mary P and Rochette's Jolly Sultana; 3, Moore on Zenda's Fontaine Maid. Yearling heifer—1, 2, and 4, Pyle on Martell's Financial Lady, Lady Silver You'll Do, and Financial Elfie's Fairy; 3 and 5, Moore on Katie's Rule's Violet and Matilda's April Girl. Senior heifer calf—1, 2, and 3 Pyle on Niece's King's Columbine, Sans Alois Niece's Opal, and Sans Alois Golden Flora; 4 and 5, Moore on Sara Patterson's Lassie and Zenda's Summer Girl. Junior heifer calf—1, Pyle on Sans Alois Golden Diploma; 2, Moore on unnamed calf.

Exhibitor's Herd—1, Pyle; 2, Moore. Breeder's Herd—1, Pyle; 2 Moore. Calf Herd—1, Pyle; 2, Moore. Get of Sire—1, Pyle; 2 Moore. Produce of Cow—1, Pyle; 2, Moore.

Senior and Grand Champion Cow—Sultan's Eminence. Junior Heifer—Sans Alois Golden Diploma.

Junior and Grand Champion Bull—Financial Richmond. Senior Champion Bull—Sans Alois Niece's King.

Brown Swiss

Bull 3 years or over—1, Marshall on Stasie Boy of Sedgeley; 2, Hull Bros. on Dick of Lake View. Bull 2 years—1, Marshall on Marcus; 2, Hull Bros. on Vogel's College Boy. Yearling bull—1 and 3, Hull Bros. on Supreme of Lake View and Cinderella Boy; 2, Marshall on Braerera II's Grandson. Senior bull calf—1, Marshall on Edgard L; 2 and 3, Hull Bros. on Irene's H Third Reuben and Dennis of Swiss Glen. Junior bull calf—1, Marshall on Bessie F's King; 2, Hull Bros. on Harold of Swiss Glen.

Cow 4 years or over—1, 3, and 5, Hull Bros. on Swiss Valley Girl's VII, Reuben's Ruth, and Bessie May; 2 and 4, Marshall on Brownie F and Bessie F. Cow 3 years or over—1, Marshall on Betsey Girl; 2, Hull Bros. on Bessie May II. Heifer 2 years old—1 and 3, Marshall on Jackson Lady and Valley Girl M; 2 and 4, Hull Bros. on Swiss Valley Girl and Bessie May III. Yearling heifer—1 and 2, Marshall on Betsey Girl's Braerera and Beaut's Braerera; 3 and 4, Hull Bros. on Belle of Lake View and Nina of Lake View. Senior heifer calf—1 and 4, Hull Bros. on Swiss Valley Girl of Merney and Lottie G. D. of Lake View II; 2 and 3, Marshall on Styx II and Beaut II. Junior heifer calf—1 and 2, Marshall on Mollie II and Brownie's Beaut 2d; 3

Sale Announcements

Sept. 25—Holsteins. Dispersion of Boardman Farms Herd of Registered Holsteins at Jackson, Mich. J. W. Boardman.
Sept. 25-26—Holsteins. Absolute Disperison of the Chas. Prange and S. E. Gehrig herds at New Douglas, Ill.
Sept. 25—Guernseys. Polk County, Wis., Guernsey Breeders' Ass'n. J. H. Stewart, Sec'y., Clear Lake, Wis.
Sept. 27—Guernseys. C. M. Paul, Staunton, Va. C. T. Rice, Sales Mgr., Oakton, Va.
Oct. 1—Holsteins. Dispersion of Broadmead Farms Holstein Herd at Union City, Mich. Thos. B. Buell & Son.
Oct. 1-2—Holsteins. The Pure-bred Live Stock Sales Co. of Brattleboro, Vermont, Inc.
Oct. 2—Ayrshires. Ayrshire Breeders' Sale at Waterloo, Ia., D. M. Henderson, Hudson, O., Sale Mgr.
Oct. 3—Holsteins. Dispersion Sale Prairiedale Farm Herd. Galt & Spencer, Dixon, Ill.
Oct. 3—Holsteins. The Dairy Cattle Congress Holstein Sale, at Waterloo, Ia., Roy L. White, Mgr., Waterloo or Woodstock, Ill.
Oct. 4—Holsteins. Redwood Holstein Farm Dispersion at Redwood Falls, Minn. Glenn W. Gold.
Oct. 4—Guernseys. Dispersion of Sylvanite Guernsey Herd at Baraboo, Wis. Richard F. Klemm.
Oct. 9—Holsteins. Dispersion of Avoca Lodge Holstein Herd at Morrisson, Colo. Donley & Simpson, Morrison, Colo.
Oct. 8—Holsteins. Dodge County Holstein Breeders' Consignment Sale at West Concord, Minn. C. L. McNelly.
Oct. 10—Poland China Boars at Lancaster, Wis., F. A. Morehouse, Sec'y.
Oct. 10—Holsteins. Fred E. Zimmerman, Washington, Ill.
Oct. 12—Jerseys. Texas Jersey Cattle Club Sale at Cleburne, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.
Oct. 15—Holsteins. Nebraska Holstein Breeders' Sale. Union Stock Yards Sale Pavilion, So. Omaha. Dwight Williams, Bee Bldg., Omaha, Neb.
Oct. 16—Jerseys. Texas Jersey Cattle Club Consignment Sale at Sherman, Texas.—Mrs. J. Riley Green, Wolfe City, Sale Mgr.
Oct. 17—Holsteins and Guernseys. Eighth Semi-annual Central Wisconsin Breeders' Ass'n Sale at Marshfield, Wis. W. W. Clark, Grand Rapids, Wis., Mgr.
Oct. 22-23—Holsteins. Lake Mills Holstein Breeders' Semi-Annual Consignment Sale, Lake Mills, Wis. F. H. Everson, Manager.
Oct. 26—Jerseys. Texas Jersey Cattle Club Sale at Dallas, Tex. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.
Oct. 29—Holsteins and Poland China hogs. Pleasant Valley Stock Farm, Thos. Maher, Brookings, S. D.
Oct. 29—Holsteins. Complete Dispersal Sale of Registered Holsteins. I. J. Case, Alta, Ill.
Oct. 30-31—Registered Holsteins. Green County Holstein Breeders' Association Consignment Sale at Monroe, Wis. C. Tochterman, Sale Mgr.
Nov. 12-13—Holsteins. Waukesha County Holstein Breeders' Semi-annual Sale. Waukesha, Wis. W. L. Baird, Sec.
Nov. 14—Jerseys. Texas Jersey Cattle Club Sale at Waco, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.
Nov. 21-22—Holsteins. Watertown Holstein Sales Co. Consignment Sale at Watertown, Wis., Francis Darcey, Mgr.
Dec. 3-4—Holsteins. The Pure-bred Live Stock Sales Co. of Brattleboro, Vermont, Inc.
Oct. 11—Holsteins. Meadow View Farm, Parker, Colo., W. R. D'Arcy, owner.
Dec. 10—Holsteins. Gormley Bros. Dispersion Sale. Jefferson, Wis.

and 4, Hull Bros. on Cinderella I of Lake View and Elsie of Lake View IV.

New York Butter Market

NEW YORK CITY, SEPT. 10:—Quotations on all grades of creamery butter have advanced three and four cents during the past week and the limit is far from reached. There has been no regularity in the advancement as some days have shown no change in quotation, while other days showed an advance of two cents. That was particularly true of Monday. Today there was a further gain of a half cent which indicates that while the advance was marked on Monday it was well advised and will be followed by further advances soon.

At the close today established quotations were as follows:—Extras (92 score), 52½@53c; Higher scoring than extras (93 score or above), 53½@54c; Firsts (88 to 91 score), 49@52c; and Seconds (83 to 87 score), 46@48½c. The strong demand for unsalted butter still continues with quotations at the usual differential above those for salted butter.

Butter is very scarce in New York and the demand continues very strong. The writer, who has had occasion of late to visit many creameries in butter producing sections, finds that there was a great decrease in production during the hot, dry weather that prevailed generally throughout such sections. The shortage created an unprecedented local demand for butter which has cut down materially our eastern shipments. The recent rains have caused pastures to improve which is already resulting in increased production.

It is the consensus of opinion among creamerymen that with improved pastures and fresh fall cows the production will be somewhat above normal during the late fall months. There is greater interest in dairying among farmers than has been known for some time because of high prices of dairy products and because of the almost certainty of an unlimited demand for such products for a long time to come.

W. B. LIVERANCE.

Judges and Breed Days at National

The official date for closing entries of cattle for the National Dairy Show at Columbus, Ohio, has been fixed at September 25. There is every prospect of a very large list of entries this year. The attendance of the leading breeders and their herds at Columbus is already assured and the opportunities of comparison and study seem too obvious to require comment. The best talent in the United States and Canada has been chosen to pass on the cattle which will be brought to Columbus.

The judges are: Ayrshires, Wm Hunter, Ontario; Prof. H. H. Kildee, Iowa; Guernseys, Chas. L. Hill, Wisconsin; Jerseys and Brown Swiss, H. G. Van Pelt, Iowa; and Holsteins, W. S. Moscrip, Minnesota.

The days of the cattle judging are:
Ayrshires, Monday, October 14.
Brown Swiss, Monday, October 14.
Jerseys, Tuesday, October 15.
Guernseys, Wednesday, October 16.
Holsteins, Thursday, October 17.
—NATIONAL DAIRY SHOW.

The farm as well as the front needs men who see straight and shoot straight.

You Are Paying For It Now

WHEN you or your help take the time necessary to milk by hand, you are really paying, in daily installments, for the Hinman Milker. You are paying out in extra *time* (which is money!) an amount that would pay for Hinman equipment in a *surprisingly short period.*

HINMAN MILKER

When you install the Hinman you begin immediately to save *two-thirds* of the time it takes to milk your cows. This may mean one or even *two* less hired men! One man with three Hinman units can milk from 18 to 25 cows an hour!

Furthermore, you will very likely get *more milk* and certainly *cleaner milk,* and your cows you will find are more *uniformly contented.*

Thousands of other dairymen have saved through use of the Hinman enough to pay for their equipment *several times over.* Thus they have *increased their profits*—to say nothing of enjoying the pleasure of milking with this safe, simple, mechanical milker.

Why not join now the big army of highly pleased Hinman users?

Send for catalog and then decide.

HINMAN MILKING MACHINE CO.

ONEIDA, N. Y.

In stock at many convenient shipping points.

EDITORIAL COMMENT

Every right implies a corresponding obligation; every privilege a corresponding duty.

It is a well known fact that the producer can increase the production of his herd considerably through better care and feeding. We have every reason to believe that this increase will follow, provided the prices for dairy products are in keeping with the prices of feeds and labor.

In the dairy sections of this country the corn crop, on a whole, is good and in other sections where drouth has injured the crop, much good feed has been gathered and put into the silo. As a rule, about 30 lbs. of corn silage is fed daily but under the circumstances more may be fed this year in many instances with less hay. It will require the use of some protein feeds to supplement the corn silage in order that an adequate amount of protein may be provided for the production of normal flows of milk. With the bright prospect for a large demand for dairy products, we believe the dairy farmer is taking no chances in equipping himself for producing a liberal amount of milk the coming season.

PRODUCE TO LIVE

"Great Britain has adopted the rationing of poultry." Such are the recent words of the Food Administration, and continuing we read: "So great has become the shortage of feed that it is no longer justifiable to support even a hen, if she fails to do her part toward feeding the nation."

The rationing system provides that the hens will be divided into two classes, those in the first class to receive 4 ounces per day, and the wants of second class supplied according to what may be left. In effect, the plan practically decrees that hens must lay to live.

There were those who last winter criticized us for advocating that only those cows should be kept that under proper care could produce at a profit; that in times of food shortage it was unpatriotic as well as unsound business to feed poor cows or improperly feed good cows. At other times it might be desirable to keep the poor cows that, in the hands of the competent dairyman, might, through the use of a dairy prepotent bull, produce daughters or granddaughters of better quality. Just now, however, our immediate concern is that the world be fed and Kaiserism swept forever from the earth.

The analogy with the British hen problem is pertinent. We may well accept as good policy, without government decree, "cows must produce to live".

WHERE IS THE BRAN?

Ever since the publication of the prices set on bran and other wheat by-products we have been besieged for information as to where these feeds may be secured. Up to the present the situation is as it was last spring, bran low in price but unprocurable. At this time most Wisconsin farmers are paying around $40 per ton retail, this price being in excess of what would seem a reasonable charge for sacks, freight, and retail profit above the fixed maximum of $23.36 per ton at the mill door in Minneapolis for bulk bran. In other communities prices would vary according to the established maximum price at the various milling centers. At Great Falls, Montana, the maximum price is $16.67 at the mill door; at Kansas City, $22.26; at Chicago, $25.26; at New York, $30.26;—the highest price prevailing being at Durham, N. C., $31.26. Recent wholesale quotations on sacked bran delivered at Fort Atkinson are $33, this being for bran from the Minneapolis mills some 300 miles distant.

Various reasons are offered as to why farmers are unable to secure bran and middlings, all of which revolve about the fact that at the price set they are the cheapest feeds on the market and therefore in unusual large demand. Indeed, the demand is so large that millers will sell very little in car lots, but insist on mixed cars in order to move their particular brands of flour. Later on this condition may change, but at present we are unable to refer individual buyers or war clubs to sources from which wheat by-products may be secured in car lots.

A discussion of this question from the standpoint of the dealer in feeds will be found in our reprint of an editorial from the "Price Current Grain Reporter," which appears under the title "Where Feeds Go". We do not agree with the remedy proposed, for without some sort of control all by-product feeds would go soaring in price. There is not, perhaps, sufficient wheat by-products available to wholly control prices of other feeds, but we do feel that it has some effect. This being true, all farmers are indirectly benefited by the control of wheat by-product prices, while others are directly benefited by the low prices at which they are buying bran and middlings.

ACID PHOSPHATE FOR WHEAT

Wheat requires a liberal supply of phosphorus in the soil to produce a good yield. Most upland soils which have been farmed for many years lack in available phosphorus. In view of this it is quite safe to use phosphatic fertilizer to enrich the soil for the different crops and especially for wheat.

Dr. C. E. Thorne, Director of the Ohio Experiment Station, has made the following statement regarding the use and value of acid phosphate for wheat: "For 24 years wheat has been grown on the home farm of the Ohio Experiment Station at Wooster, Wayne County, with no other fertilizing than 160 pounds per acre of 14 per cent acid phosphate on each crop. The wheat has been grown in a five-year rotation of corn, oats, wheat, clover, and timothy, located on five different tracts of land, so that each crop has been grown every season. The outcome has been that the wheat receiving this quantity of acid phosphate has yielded eight bushels more wheat to the acre as a 24-year average than that grown on adjoining land left without any fertilizer treatment."

In other words, 160 lbs. of acid phosphate has produced eight bushels of wheat and besides it has increased the yield of the other crops. This makes it easy for a farmer to determine whether it will pay to use acid phosphate.

NEW SELECTIVE DRAFT BILL

Congress has passed the new man-power bill and the registration of men from the ages of 18 to 20 inclusive and from 32 to 45 inclusive has been completed. According to Provost Marshall Crowder about 2,400,000 out of the total number of registrants may be used in active war service. The direct purpose of this measure was to increase our war strength, for the present business of this nation is war. It is not the purpose of our government to upset industry any more than is possible, but to place itself in control of all able-bodied men in the country.

It is, of course, expecting too much that industry will not be disturbed by this new selective service. The farmers will not find their burdens any lighter during the coming year than in the past, but we can not engage in a great war without disturbing our industry and without making sacrifices for our country.

Notwithstanding the heavy tasks placed upon the farmers, they have met the demands of the country without any break-down in their industry. This cannot be said of all other industries. Our transportation, mining, and manufacturing have cracked under their loads. The farmers have a right to feel proud of their achievements.

The one comforting fact in this new selective draft bill is that it will provide opportunity for building a large army and bring into service a greater number of men to make munitions of war, for the sooner we can put this nation to its full war strength, the sooner the horrible job will be over.

MIS-STATEMENTS DEPRESSING

Mis-statements are unfortunate. It seems as though our abnormal conditions have created abnormal conceptions, and have hindered the people from forming a true prospective of dairy conditions.

Since we entered the war, we find those who hold that the dairy cows are being slaughtered, that milk consumption has decreased, that there is less demand for butter and cheese, and, on the whole, taking a gloomy view of our dairy situation. In our close association with those engaged in the production of dairy products we find them accepting their tasks as cheerfully as any class. It must be expected that peaceful pursuits will be interfered with when we enter the gigantic task of putting four or five million men in Europe. No class of farmers has met the burdens placed upon it better than the dairy farmers and no industry has responded to the call of our country better than agriculture.

Mr. James J. Harvey of the Chamber of Commerce, in calling the dairy interests of Indiana together for the purpose of organization, stated: "In the last year milk consumption has decreased from 15 to 50 per cent, butter consumption decreased 33⅓ per cent, and oleomargarine has increased 150 per cent."

The Chicago Dairy Produce in commenting upon this says: "While we do not know where Mr. Harvey secured the figures upon which to base his statements of decreased milk and butter consumption, we fear it may occasion a misunderstanding and a feeling of discouragement among producers and consumers. There has been no decrease of production of milk and the loss of consumption, due to high prices, has been offset. Had Mr. Harvey stated that at least three times as much of milk and its products had been exported as ever before and that this government and its allies are holding great stocks to supply the needs of the armies and navies, his statement would have given a different impression."

It may be said that there are a few sections which have disposed of more cows than usual, but, on the whole, the dairy cow population of this country according to government statistics has increased, and especially in young cattle, since we entered the war.

We are not going to encourage the dairy farmer by holding up to him the exceptions, but rather by keeping him informed regarding the dairy industry as a whole and the opportunities that the future holds for his products and his cattle.

RECORD BREAKING WHEAT YIELD

Every good farmer desires to increase the productivity of his fields. It is not always a simple matter to know how to treat a piece of land in order that it will produce a larger crop. But in the past 15 or 20 years some progress has been made in learning about fertilizing lands which we may accept as fundamental.

The wonderful crop of wheat produced by Mr. Mann of Illinois, and reported in the Prairie Farmer, should be of interest and value to every farmer in this country. According to the report, Mr. Mann had 25 acres of wheat which averaged 63 bushels per acre. This, we believe, was one of the largest, if not the largest, yields of wheat ever produced in this country. We have followed the field practices of Mr. Mann very closely, and it has been a source of deep satisfaction to note the progress he has made since he started to treat his soil according to the teachings of Dr. Hopkins of the Illinois College of Agriculture. The question which interests our readers is: How did Mr. Mann obtain such a splendid yield of wheat? Here are his own words as we take them from the Prairie Farmer:

"The field has been having a rotation of corn, oats, wheat, and clover for about 12 years, with phosphate applied with clover before plowing under the second crop. Two applications of ground limestone had also been applied which amounts to about five tons per acre. The total amount of phosphate applied amounts to about four tons per acre and parts of the field have had five tons per acre. Some manure was also applied a few years ago to a portion of one of the fields, but on this part of the field the wheat was down to some extent, and as the wheat did not fill so well where the manure had been applied, the yield was really lessened somewhat as an effect of the manure."

"Last year the oats on these fields yielded from 96 to 115 bushels, according to the variety of oats. The year previous the corn yielded 81 bushels per acre. The previous year the crop was volunteer wheat and alfalfa, with a yield of 35 bushels volunteer wheat. Four years ago these fields were in wheat and with a yield of 52 bushels. There is now a very good stand of young mixed clovers consisting of a mixture of red, alsike, and alfalfa with some timothy."

"To grow 50 bushels or more of wheat per acre the soil must be in a high state of fertility, but it is not necessary that it be very "rich", as this term is usually used. The term "rich" is usually applied to soils that have a high active humus content—a large amount of decaying vegetable matter, enough to cause the soil to be dark brown or black in color."

"The 'rich black' soils of the corn belt are usually too rich in nitrogen and not rich enough in phosphorus. In consequence of the excess of nitrogen over phosphorus there are likely to be many troubles to the wheat—straw grows rank but tender and weak enough to break down; various fungus and insect troubles such as rust, scab, fly, and bug. While there is much straw there is too little grain in proportion and the grain is frequently inferior in quality.

"As these troubles are due to the low proportion of phosphate, it may not be desirable to try to

grow much wheat until the phosphorus has been largely increased."

It may be said that Mr. Mann was one of the first farmers in Illinois to purchase raw rock phosphate and lime and the results of his large wheat crop show the wisdom of his work.

Where Feeds Go

In discussing this subject The Price Current Grain Reporter says:

"Referring to an editorial in these pages on August 14, headed "Mill Feed Situation," a well informed reader has suggested that the apparent shortage of mill feeds is caused not so much, as was tentatively suggested, by action of the requirement of a high extraction of flour from the wheat milled, which increases the quantity of flour while it reduces the quantity of the milling offals (although there must be some reduction of the latter products), as to other causes.

"The fact is, as we are reminded and as we have previously stated herein, that at this time, owing to purely artificial causes, nearly all of the mill feed is sold locally by retail, right from the mill door to farmers in the immediate vicinity of the mill or to those who go even quite long distances to the mill in order to buy this feed. There are two reasons for this, both of which are quite apparent. One is that the miller is permitted to charge approximately $3 per ton more for his feed when sold at retail in this way than when he ships it out in car lots. The second cause is the artificial price put by the Food Administration upon the feed itself. The net result is that hog feeders can buy mixed feeds at about $30 per ton, whereas the corn which they raise is worth approximately $60 per ton, or where the farmer would have to buy corn it would probably cost him still more. The farmer, therefore, can take a ton of mill feeds, feed it to his hogs and obtain a profit on a single ton of from $40 to $50. If a farmer has hogs enough to use up a ton of feed per day he has a very splendid business, as any one can readily see, one that runs very rapidly into "excess profits", but upon which it is not likely the farmer will pay any excess profits tax or even an income tax. Farmers generally are not built that way nor do our congressmen require them to be different.

"Now, of course, the Food Administration, which has undertaken to regulate the disposition of the mill feeds so that there shall be no undue profiteering in their distribution, did not perhaps foresee what is now happening, although practical men might have anticipated some such condition. Mr. Hoover, speaking at the National Milk and Dairy Farm Exposition in New York City on May 23rd, called attention to the vastly important function of the American dairy at this time and laid much stress on the "heart-breaking reaction of diminished milk feeding of children" everywhere, and upon the necessity of building up reserves of dairy products as well as conserving dairy herds. Undoubtedly, therefore, the intention of the Food Administration in fixing the price of mill feeds as it now stands was to lower the price of the mill feeds, which, as it has turned out, is out of all proportion to other feeds, in order that the dairyman might secure cheap feeds and thus help to keep down the price of milk and butter and also to increase their production; but as it now appears the order was injurious, a complete failure, because the actual effect of the order has been that dairymen as a rule are not able to obtain mill feeds at any price, by far the larger part of the mill feed now being produced being secured by the hog feeders who obtain from $16 to $20 per cwt. for their product. The Food Administration has made things very pleasant for the hogs but not so pleasant for the babies.

"We have frequently in the past referred to the unfortunate results of the arbitrary rules governing both the price, the storing, and the general disposition of feeds, and we have it on the authority of one of the largest interior manufacturers of mixed feeds that prior to last December, when the arbitrary lowering of prices took effect, he was a large buyer of mill feeds for distribution as wholesaler to the elevators throughout the Central States and to consumers generally; but since that time he has been unable, as have practically all makers of mixed feeds, to obtain mill feeds in car lots in any quantity and since the grinding of the new crop began both the feed manufacturers and dealers generally throughout the entire country have been unable to buy feeds in full car lots or at all except in mixed cars, taking the flour in many instances in order to secure the much needed feeds.

"What is the remedy? No one seems to have one; but at the Ohio State Millers' Convention of some two weeks ago, where the matter was very fully and freely discussed, about the only practical solution of the business seemed to be to take off all price restrictions whatever and let mill feeds sell on their merits. It is believed that such a course would result immediately in the distribution of mill feeds in practically the same way that they were before the price was fixed by the Food Administration. At any rate, it is pretty certain that by such a course the dairy, which needs the mill feeds much more than the hogs, would be able to obtain its share, which now the dairy is unable to obtain at any price. And the price of flour would be lowered automatically."

Harvesting Buckwheat

What is your advice as to time of cutting and method of cutting a small field of buckwheat in this vicinity? This is our first year experimenting with buckwheat and we are not sure that we know just the best time to handle same.

Janesville, Wis. A. P. L.

The general recommendation is to cut buckwheat when the first seed ripens. However, on Hoard's Dairyman Farm we usually cut it somewhat later than this. In any manner of handling or time of cutting, there is quite certain to be some wastage as the buckwheat ripens unevenly and therefore shells out to a certain extent.

Buckwheat is probably best cut with a cradle or self-rake reaper. The gavels are set up without binding in order that it may dry out quicker, the tops being merely pressed together with the hands, given a slight twist, and the interlocking of the bunches holds it together well enough for handling.

Last year, however, we cut our buckwheat with a self-binder, shocked it as we did ordinary grain, and it came out in good condition. The buckwheat is not stacked or hauled into the barn but is threshed direct from the field after drying out thoroughly.

Chess in Wheat Seed

All the winter wheat that has been raised around this community is mixed with chess. Will wheat after graded and cleaned be apt to be infected with this germ of chess? I wish to sow about 5 acres.

Milton Junction, Wis. C. S.

Chess is an annual grass that will not produce seed unless sown in the fall, and consequently is not found in spring wheat. It is more prolific than wheat and is more resistant against cold and insects. Cases are reported where one pound of seed has multiplied ninety-nine fold in one generation. Chess injures flour and must be cleaned from wheat before grinding. It must be understood that chess does not grow from wheat seed nor is it caused by a germ. It is a distinct grass plant or weed and has its own seed the same as oats or any other plant. In the West, chess (or cheat as it is sometimes called) is grown for hay, and is somewhat inferior to timothy for this purpose.

Seed wheat properly cleaned by a fanning mill is quite free from chess. If the wheat seed is treated for smut by stirring it in a solution, the chess seed will rise to the surface and can be skimmed off. After the wheat seed has been properly cleaned, it would be desirable to sow it on the ground which had not grown wheat the previous year as doubtless numbers of the chess seed will have shelled out prior to or during the harvest of the wheat.

Ration Lacking Succulence

Can you help us by giving us information in regard to winter feeding of our cows? We are unable to give them silage this year and will have nothing in the way of succulent feed for them. We found that they did not do well last winter on nothing but afalfa and grain. Do you recommend beet pulp?

Pine Mountain, Ky. E. H. F.

Succulent feeds are necessary in a ration which is to return the very largest production possible. In most sections of the country corn silage is a very satisfactory succulence particularly because of its economy. If a liberal supply of silage for the dairy herd can be secured, pleasing results will be had. Failing this, beet pulp soaked twelve to twenty-four hours before feeding in three to four times its weight of water will prove very satisfactory. Cows relish these succulent feeds and are stimulated to increased consumption of feed which in turn results in a large flow of milk.

In feeding pulp the fact should be borne in mind that in a dry condition it has an analysis quite similar to that of corn and that in the ration it may be allowed to replace a considerable portion of the carbohydrate concentrates of the grain mixture.

Even failing to use a succulent feed we believe very good returns should be made from a liberal feeding of high quality alfalfa hay supplemented with a suitable grain mixture. We have seen many herds of cattle which produce splendidly whose ration is made up largely of alfalfa. It should be fed in as large quantities as they will consume, being careful, of course, that the hay is not wasted but being equally certain that the cows are never stinted on it.

Grain should be supplied in addition to all cows producing heavily, at the rate of about one pound for each 3½ pounds of milk produced. This grain mixture must be palatable and balance up satisfactorily with the alfalfa.

Price Per Gallon and Pound Fat

What will butterfat at 75 cents per pound return for milk testing 4.2 to 4.5%; that is, how much per gallon will the milk be worth?

Wesson, Miss. H. M. A.

A gallon of milk will weigh approximately 8.6 pounds, and a gallon of milk testing 4.2 per cent would therefore contain slightly over .36 pound fat. At 75 cents per pound fat, this would make a gallon of milk testing 4.2 per cent worth 27 cents per gallon. In a gallon of milk testing 4.5 per cent, there would be .387 pound of fat which, at 75 cents per pound, would make the gallon of milk worth 29 cents.

Another Preservative Exploded

Dr. Wm. Brady, a man who evidently sends out syndicated articles to the daily press, advises an inquirer that "ten to fifteen drops of peroxide of hydrogen added to a quart bottle of milk will prevent souring and not have a deleterious result."

If true, the above recommendation would be of large benefit to the dairy industry, but having had similar "cure-alls" presented and exploded we conceived the best recourse would be to refer the matter to a trained and competent authority on bacteriology. Dr. E. G. Hastings of the University of Wisconsin, gives us the following:

"In reply to your inquiry concerning the statement given in the clipping from a Boise, Idaho, paper, I would say that hydrogen peroxide when added to milk has a marked preservative effect. A number of years ago, a Danish engineer devised a method for the preservation of milk which consisted in the addition of a small quantity of hydrogen peroxide to the milk and then heating to about 50° Centigrade for an hour. The process was called the "Budde process" after the man who originated it. The combined effect of the hydrogen peroxide and of the heat destroyed practically all of the non-spore-forming bacteria in the milk. The process was never a commercial success, due first to the expense. Only perfectly pure hydrogen peroxide could be used. Commercial hydrogen peroxide is made from barium peroxide. Traces of barium are likely to be found in the hydrogen peroxide unless extreme care has been used in its manufacture. Barium salts are poisonous. Milk will decompose hydrogen peroxide, forming free oxygen and water. Different samples of milk will decompose varying amounts of hydrogen peroxide. If more hydrogen peroxide is added to the milk than the milk will decompose, a distinct metallic taste will be imparted to the milk. Apparently in the Budde process traces of the hydrogen peroxide might remain in certain quantities of milk treated.

"Milk treated with hydrogen peroxide has also been suggested by some noted sanitarians to be used in place of pasteurized milk. For example, Behring thought that milk from tubercular cattle contained certain substances which exerted a protective action against the disease. It was his idea that such milk might be used for the feeding of children and thus give to them a certain degree of immunity against tuberculosis. In order to avoid any danger from tubercle organisms that might be present in such milk, he suggested the addition of hydrogen peroxide. He devised, and there was placed on the market in Germany, a substance which was to be added to the milk which would decompose any residue of hydrogen peroxide not decomposed by the milk itself. I am under the impression that this scheme was used to a very limited extent in certain of the children's hospitals in Germany.

"It is quite probable that milk will decompose the amount of hydrogen peroxide mentioned in the clipping. In other words, the peroxide would be changed into two perfectly harmless substances as far as health is concerned. I feel quite certain, however, that the health authorities would object very strenuously to the use of peroxide in milk."

TEN (OF MANY) CASE Betterments

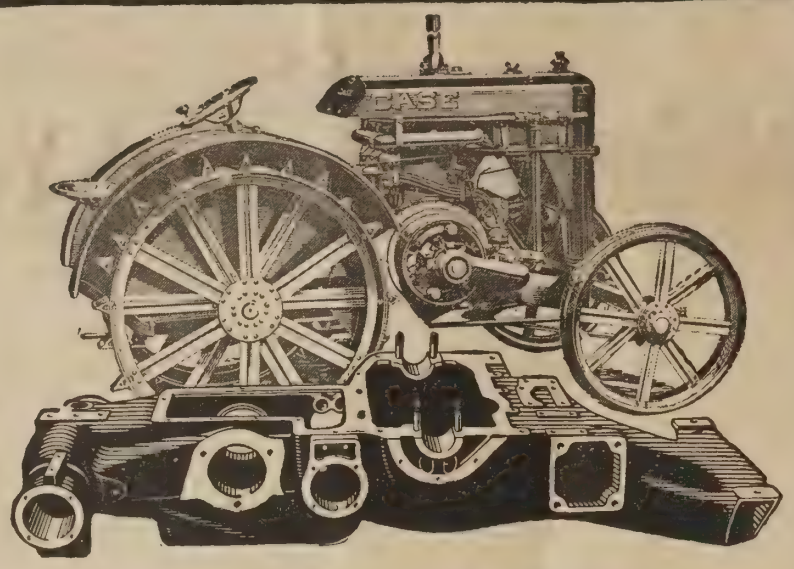
1 Weighs only 3400 pounds, little more than a team of horses. Low and compact with short wheelbase. Turns in 22 ft. circle. Stays on all fours.

2 Rated 10 H. P. on drawbar, but develops nearly 14 H. P. Rated 18 H. P. on the belt but delivers about 24 H. P. This insures abundant reserve power.

3 Four cylinder Case valve-in-head motor. Removable head. Motor is set crosswise on frame, affording use of all straight spur gears. This conserves power.

4 Belt pulley mounted on the engine crank shaft. No gears used to drive it. Pulley is part of the tractor, not an extra-cost accessory.

5 All traction gears are cut steel, enclosed and running in oil. No bevel gears, chain, worm or friction drive parts.



6 Case-Sylphon Thermostat controls cooling system and insures complete combustion of kerosene in the motor. Prevents raw fuel from passing by pistons and diluting oil in the crank case.

7 Case air washer delivers clean air to carburetor. No grit nor dust gets into cylinders to minimize their efficiency and shorten their life.

8 All interior motor parts lubricated by a combination pump and splash system. Speed governor, fan drive and magneto are dust proof and well oiled.

9 Complete accessibility. No dismantling necessary. Removable covers permit you to get at parts quickly.

10 Hyatt Roller Bearings in rear axle, bull pinion shaft and transmission case. Kingston ignition and carburetor. Five-piece radiator with a cast frame. Core is copper. Fin and tube non-clogging type.

This One-Piece Main Frame

Reduces Vibration—Prevents Disalignment

Here we picture a new tractor achievement—the frame of a Case 10-18. It is the fore-runner of new-day ideas in designing.

Note that this casting constitutes a dust-proof housing for the rear axle, bull pinion shaft, transmission shafts and the bearings for these parts. It also provides a base for the motor, which sets cross-wise.

This type of frame construction brings rigidity unattainable in a fabricated frame. It insures constant alignment of bearings, shafts and gears. Owners avoid gear troubles. Thus we prevent power losses.

And we multiply strength while reducing weight.

This one-piece frame is one of the greatest advancements in tractor history. It was inevitable. Others are bound to follow. But Case is in the lead. Case offers you now, today, what later on will be adopted generally.

This is only one of many betterments, some of which are itemized at the left. Do you know of any tractor offering all these superiorities?

A complete description of the Case 10-18, with illustrations and specifications, will be mailed upon request. Write for it today. Or visit a Case dealer.

ABORTION IN CATTLE
PREVENTED AND CURED PERMANENTLY. YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

Stop Losing Calves

If STERILOID is used at first sign of abortion cow will go full time and have a healthy calf. If cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID.

GUARANTEE We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY
Dept. A2, 398-408 Columbus Ave., New York City

Cow Testing Associations

(Continued from page 257)

my records for the past month I find that a herd of cows which has been kept in a dry lot this summer and which was fed a balanced ration of corn silage, alfalfa hay, bran, and cottonseed meal has been more uniform in its production of butterfat than any herd in the association. Several members who have been trying to balance their ration have found that it pays. One member by the use of the balanced ration raised his butterfat production one-third over what it was last month.

A test was made from the skimmilk of seven separators this month, one of which was found to be losing .4 of a pound of fat in every 100 pounds of milk separated. These separators should be adjusted so as not to lose over three to four-hundreths of one per cent of fat.

Dearborn:—I found since I took up the work one cow that was not paying for her board and several more that were returning less than $1.25 per the dollar invested for feed. In several cases where the pasture was short I found they were obtaining good results with some grain feeding. The association met July 27th and at the meeting decided to buy two carloads of feed. By getting it in so large a bulk they were able to save considerable.

A Yearly Report

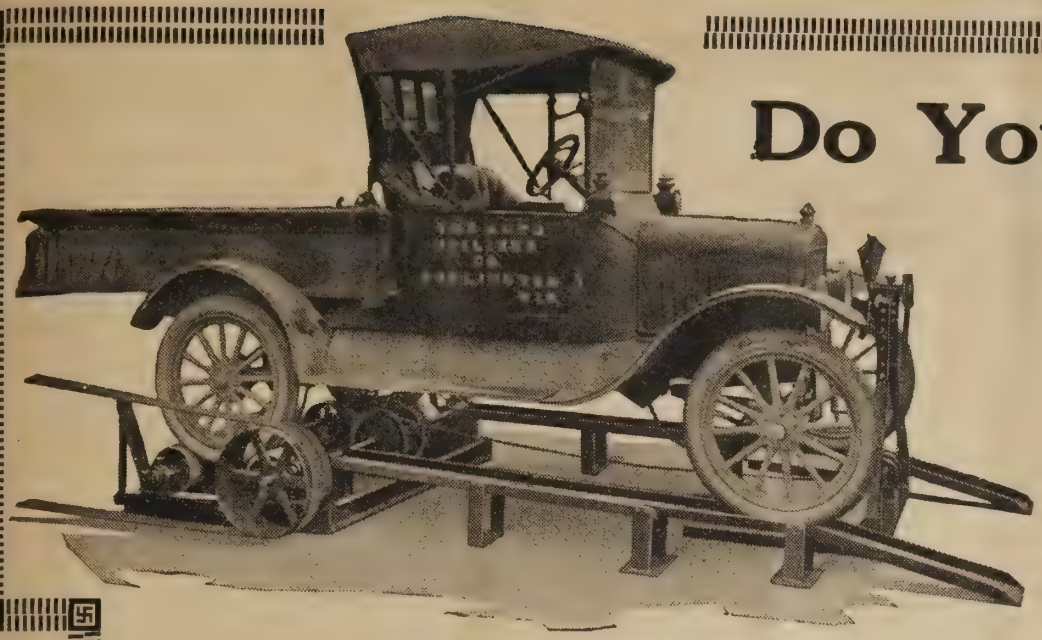
Mr. Harold Harkness, tester for the Dover Association of Minnesota, secured the publication of his annual report in his local paper, from which we quote the following:

"During the year 550 cows were tested. Two hundred sixty-three completed the year's work with an average of 259.2 lbs. of butterfat as compared with 205.8 lbs. the preceding year, an increase of 53.8 pounds.

"One hundred five cows were sold and 110 were purchased to replace them. The first year's work showed that 17 cows produced over 300 lbs. butterfat as compared with 74 cows over 300 in the second year's work. Nine of these were over 400 lbs. and one over 500 lbs.

"The high cow for the year is Fawn, a grade Guernsey owned by John Henry. She made 520.58 lbs. fat.

"During the year the following new equipment was purchased by members:—Seven installed water bowls in their barns; seven installed steel barn equipment; twelve installed milking machines; three installed motor to run separators and milkers; five purchased new separators; five erected new milk houses; and four built new barns. One new silo was built making every member a silo user with the exception of two who are now building.



A successful calf show was held on June 11th. The show was of value to the community through the interest and enthusiasm it aroused in better stock. The Red Cross also profited to the extent of $221.85 on calf show day.

"Under the direction of the Farm Management Division, University of Minnesota, special accounting work was carried on throughout the year. This is to be used as data on the cost of milk production. The results will be made public at a later date.

"The average production of the 24 herds in the association ranged from 165 to 374 lbs. fat per cow for all cows on test over 8 months. Eight of these herds averaged over 250 lbs. fat. The following table gives the names of owners and records of cows producing over 365 lbs. fat per year, 'A Pound of Fat Per Day'."

Owner	Breed	Milk Lbs.	Fat Lbs.	Profit over cost of feed

The war has greatly increased the demand for dairy products, and it is also important that they be produced economically. In order that the quantity of dairy products may be large and the production economical, more and better cows are needed. The raising of all the best heifer calves will provide cows enough to permit the culling out of all low producers.

Do Your Silo Filling With Your Auto and the Auto Utilizer

Improved to the point where it is the only practical adequate device **for getting all the usefulness out of an auto engine that any farm power requirement can possibly demand.**

Specially Air Cooled, reproducing the effect of running the car against the wind. No possible danger of overheating the engine.

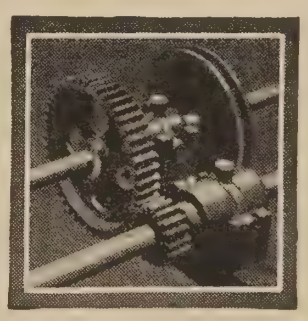
No Jacking Up the Car — car stands level, and runs exactly as it does on the road—both wheels revolve the same all the time—just like running for miles and miles in a perfectly straight line.

Tires Run on Rubber Rollers. After steady running of new tires equal to thousands of miles of road travel, they hardly show any evidence of use—in fact, much less than would be shown after travel over ordinary roads a similar distance.

Built Sectional—Easily Moved About. See the bottom illustration showing the dissembled Auto Utilizer. This feature enables two men to take it apart and load it onto the auto in five minutes, and transport it wherever they wish to use it next.

The Auto Utilizer Really Makes the Auto Engine the Only Engine Needed on the Farm. No need to buy an expensive engine, costing up to $300 or $800, to fill silo and do the other farm work if you own, or wish to buy, an Auto. The Auto Utilizer enables you to do all this work at the saving between the price of such a special heavy duty engine and the cost of the Auto Utilizer.

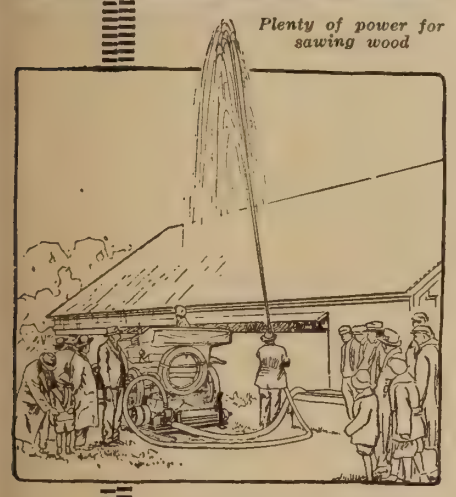
$220 F.O.B. Factory. Price, subject to change. Buy now before material and labor costs increase.



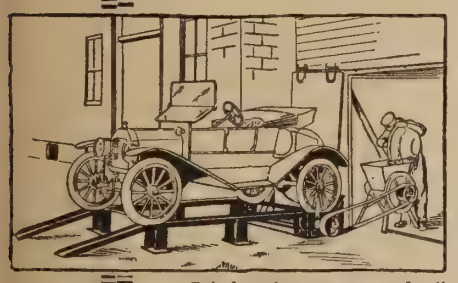
Does Not Force the Car to transmit the power through one wheel, causing strains on the differential and eventually pulling the wheel out of alignment.

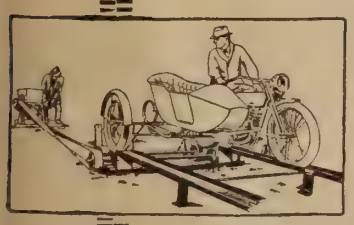
Provides a Secure, Firm Basis for attaching pulley—no tendency to pull away from car after the belt is on.

Automatic Adjustable Rocker--Base Housing — keeps shaft always in alignment. Equipped with Hyatt Roller Bearings—nine on each outfit.

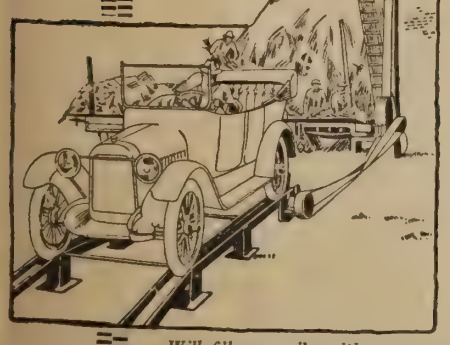


Geared Down to a point that relieves the effort of the car to the minimum.





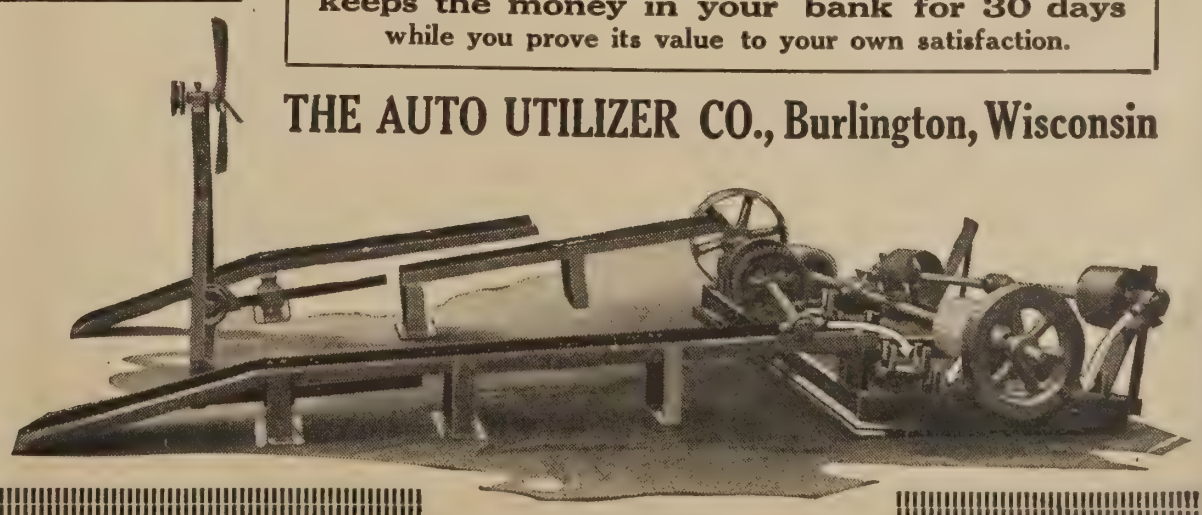
Plenty of power for sawing wood



Pumps water and operates power pump for fire protection

Grinds wheat, corn and all sorts of feeds

Even a Motor Cycle runs it, grinding feed



Will fill your silo with ease—day by day as you cut

THE AUTO UTILIZER CO., Burlington, Wisconsin

RKD ARCADY

ANNOUNCEMENT

FARMERS and feeders who have been feeding the well known and popular Arcady (R K D) Feeds, will be pleased to know that the Company are supplying their trade in their usual prompt and careful manner in spite of their recent fire loss.

Regardless of modern fire extinguisher protection, three hours served to send up in smoke one of the most modern and up-to-date equipped feed mills in America. The Poultry Feed plant, we are glad to announce, remains in full operation for the immediate shipment of orders.

Plans are already under way for the quick and immediate rebuilding of the plant on even better plans than heretofore.

Meanwhile, orders for R K D Dairy, Hog and Stock Feeds will be shipped from associated plants with the same painstaking care as before.

May we, therefore, ask you your continued patronage and support, which we shall do our best to merit and satisfy.

Yours very truly,

ARCADY FARMS MILLING COMPANY

Price Fixing and Cost of Farm Products

(Continued from page 255)

and demand is too little understood. It does not always work perfectly. It might be made to work much better under the guidance of a commission than when left to the free and unequal bargaining power of great distributing corporations on the one hand and the isolated producers on the other.

A properly constituted, permanent price commission might inaugurate an educational program which would improve the mutual attitude of mind of the producer and consumer toward each other, which would make each more considerate of the rights of the other that are in the long run fundamental to the interests of all concerned.

Furthermore, such a commission, well informed with regard to the facts of production, distribution, and consumption, would form a desirable medium for collective bargaining between the organized producers on the one hand and the organized distributors on the other, which appears to be the logical outcome of present tendencies and which would appear to be desirable wherever large numbers of isolated farmers are selling to large corporations such as the milk distributors in the large cities, the packers and the grain dealers, and possibly in many other instances. Even where the more specific functions of price-fixing are unnecessary, there is an important work for price commissioners in studying market conditions and the conditions of supply and in educating both producer and consumer to rational action.

In passing judgment upon the merits of commission prices in comparison with unregulated prices, too much weight should not be given to the results of commissions which of necessity have been organized hastily under the stress of war time conditions. It will take time to develop good price commissions; but what is so much worth while is worth striving for.

Digest

The demand for price regulation has increased rapidly during the past year. Cost of production is assumed to be the basis of this regulation, but there has been much difficulty in the application of the cost principle to price-fixing.

Costs vary greatly from farm to farm. To fix prices on the basis of average costs would leave about half the farmers producing at a loss.

There are differences of opinion as to whether produced feeds should be charged at cost of production or the market price.

It is difficult to distribute cost of production. Much of the expense would be the same if one crop in a rotation were dropped; hence the specific cost of a given crop cannot be used as a basis of price-fixing.

Total farm profit is recommended as the starting point in price-fixing. The combined prices of the group of crops produced on one farm must be enough to make the given type of farming profitable. For example, if the milk price is continually held too low, farmers may find total farm products greater in the production of beef or wool, in which less labor and cheaper feeds are required. Where there are competing crops such as barley, oats, and wheat from which the farmer may choose, the price of wheat cannot be held down, while the others are high, without danger of reduction in the seeding of wheat.

A bad system of price regulation may do untold damage by destroying agricultural industries which have required decades to build. The long-time point of view is necessary and should be considered by price commissioners, producers, and consumers.

Price commissions should make a careful study of the demands for consumption at the various possible prices, and then carefully study the conditions of production to find what supplies can be produced profitably at the various prices and adjust them with a view to keeping supply and demand balanced.

A price commission might well act as a medium for collective bargaining in the sale of farm products and in the purchase of supplies. It could steady prices, guide production, and in a measure, direct consumption so that the greatest good might result to all concerned.—H. C. Taylor in Bulletin 292, Wisconsin Experiment Station.

Necessity of Dairying During The War

(Continued from page 251)

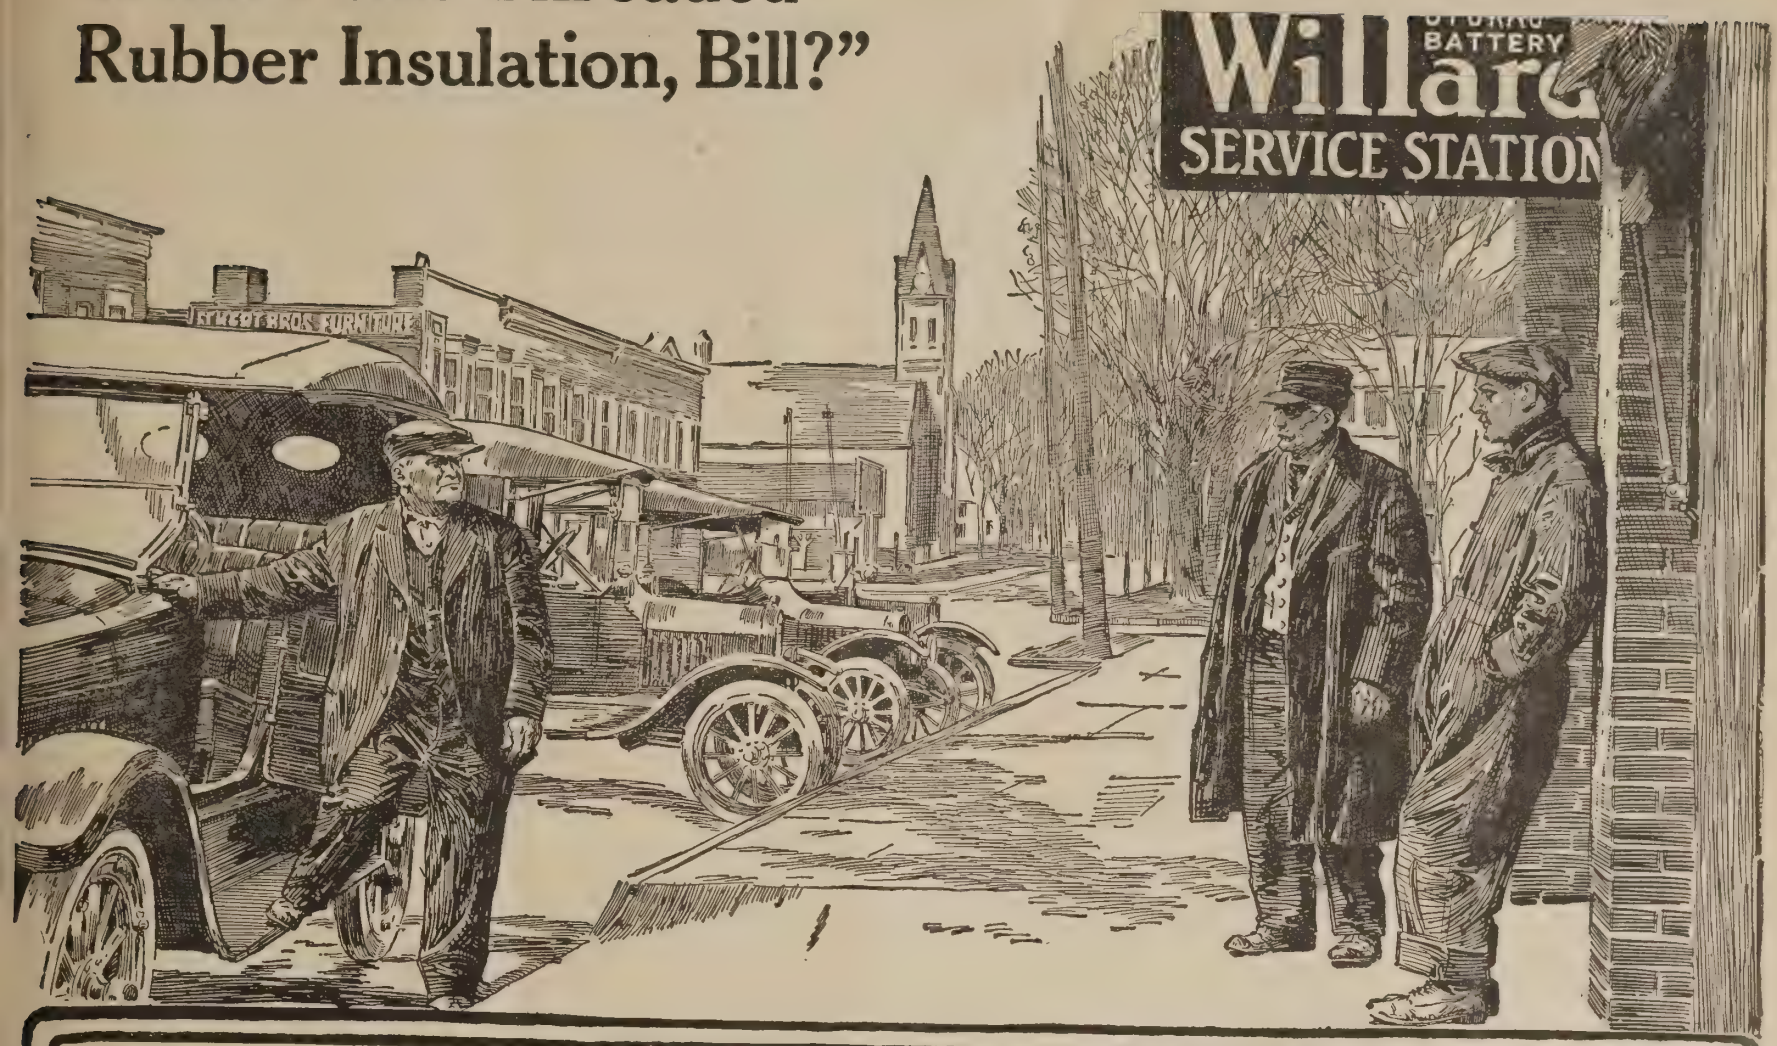
must begin by first organizing the producers and teaching them the simple farm departmental methods of cost accounting.

As Prices Rise Dairying Declines

The keen observer along dairy lines has always found the dairy business on the decline during the time of high prices, while the greatest development has been made during times of depression. Upon analyzing this situation it becomes very clear that in order to maintain the profitableness of the dairy business the price must increase directly to the advance in price of everything that enters into the production of milk. Since every item increases, the increase in the cost of the final product is proportionately much higher than the increase in cost of the elementary commodities that enter into it.

Undoubtedly sooner or later—it may be through regulations and it may be at the end of the war—these commodities will gradually be lowered in price and then the dairy business will automatically become a profitable business. But dairy farmers have large investments in their dairy plants and if they are forced to sell during the crisis which we are now facing, it will be done at a sacrifice and these dairymen will very reluctantly enter into the business when prices are low again.

To help carry the producer over this crisis, therefore, becomes the particular problem in which every man and woman should be interested. If the preservation of the dairies is neglected now, the consumer must pay the penalty later on by paying proportionately increased prices for milk, during the time of a decline in prices of other commodities, in order to compensate for the losses sustained. —[Address given before the National Dairy and Food Commissioners' meeting.]



Barrenness

Can you give me some information in regard to a cow that comes in heat regularly but does not seem to catch. I had a calf from her last August but she is not with calf yet. She is too valuable a cow to beef without trying some cure. I have had more or less trouble with some of my other cows but after a time they would breed.

Ingram, Wis. J. VANP.

As often stated here there is no specific remedy for barrenness and the best treatment is to have the ovaries massaged two or three times at intervals of a week and the veterinarian should also treat the womb if an examination shows that to be necessary. Only a specially trained and experienced veterinarian can do such work properly. Meanwhile syringe the vagina out two or three times a week with lukewarm water containing one dram of pure phosphate of soda to the quart.

"What's this Threaded Rubber Insulation, Bill?"

"Come in and See for Yourself"

"Here's a piece of it—just looks like a square sheet of rubber, but notice those little specks all over the surface.

"Each one is the end of a tiny thread that goes through from front to back —196,000 of 'em.

"They draw the battery solution just like a lamp wick draws oil.

"That means that you can have *hard rubber* insulation between the plates of your starting and lighting battery and still have the *free passage for the battery solution,* that is necessary for a good, strong current.

"The rubber keeps the plates from short-circuiting; keeps your battery in good shape and prolongs its life.

"It's an insulation electrical engineers have wanted for years, and now Willard has made it possible.

"Yes, it costs a little more, but nothing like what it saves in extra life and freedom from repairs.

NOTE—Write for free booklet "The Wick of the Willard" and list of Willard Service Station addresses. Sent free, postpaid, on application to The Willard Storage Battery Company, Cleveland, Ohio.

55 Head Pure-bred Holsteins

To Be Sold at Union City, Mich.

Tuesday, October 1st, 1918

Being a Dispersal of the Thomas B. Buell and Son Herd and Consignments by Ray Parham, John Gintling, Wm, Tase and Sidney Smith.

Sale includes: 2-year-old grandson of King of the Pontiacs and Pontiac Aaggie Korndyke, a combination never offered before in 30-lb. breeding; 8 two-year-old heifers, ready to freshen, sired by a $3,000 son of King of the Pontiacs; a 24-lb. cow that made 96 lbs. milk her best day, with two of her daughters; a daughter of a 26-lb. cow; a 22-lb. daughter of Pontiac Aaggie Korndyke; 3 granddaughters of Pontiac Aaggie Korndyke.

All animals from best blood of the breed—and all guaranteed against contagious abortion and tuberculosis for 60 days.

Union City is on Michigan Central—jitney service from Battle Creek and Coldwater.

Col. B. V. Kelley, Auctioneer. **S. T. Wood, Director.**

Young Bulls From Seven-Day and Yearly Record Dams

Dams of all bulls have official records of from 15 to 25 pounds of butter. All are now on yearly semi-official test and will complete records this fall and winter. Nearly every cow has completed cow testing records for three years and has produced up to 600 pounds of butter. These cows are never pushed to the limit. The bulls offered are sired by bulls secured from the E. C. Schroeder and other noted herds. Sires' dams have records up to 950 pounds of butter. Bulls are heavy bone, straight, well marked and large for their age. They will and must please. We guarantee satisfaction.

Otter Tail County Holstein Breeders' Association, J. V. Bopp, Fergus Falls, Minn.

Fourth Liberty Loan

Economy in every department of farm life and the purchase of Fourth Liberty Bonds at the present time will pay big dividends later on. With the nation at war and your boys or your neighbors' boys giving their all for their country and for civilization, any personal financial sacrifice made by those who stay at home will be small compared to the sacrifices made by our soldiers and sailors, and small beside those terrible sacrifices made by our allies who have been fighting our fight for four long, weary, devastating years.

By putting your money in Fourth Liberty Loan Bonds you will be creating a reserve fund that will be a bulwark to you financially in later years after the war. You are lending your money, not giving it. The measure of your support, moreover, will be the measure of the force for which this country can put into the war to crush the forces of Hundom. Now, if ever, with the Hun on the run along the western front, is the time for everyone to swell the national resources to the overwhelming point by the contribution of every ounce of individual co-operation and support.

Farm prices for all commodities are high and the money loaned the government is coming right back to the farm through the channels of commercial life, huge purchases of every species of farm products guaranteeing a tremendous and continued demand. The farmer, consequently, who loans money to the government, is not only doing his part in aiding the government, but in swelling the funds that are being expended in large measure for his own products.

The Fourth Liberty Loan will be the largest single flotation of bonds in the history of any country. It will, in a sense, be a test of the financial resources of the greatest country in the world. To make it a success that will strike fear into the hearts of our enemies and cause jubilation in the allied countries will mean tremendous efforts on the part of every one and actual personal sacrifice on the part of many. However, compared to the efforts of our allies, our actual resources are still hardly touched and with the inspiration afforded by the victories over the Hun in France in which our fighting men gloriously participated, and with our determination to win steeled by the increasing casualty lists which are making the war a stark reality in every section, the "Fighting Loan" will be put over with a rush.

While the Yankee lads are fighting their way toward the Rhine, and giving their all; while England, France, and Italy are throwing their entire national forces of life and money into the struggle, there will be no patriotic American who will not do his part.

GEO. A. KING.

Whitewash Recipe

HOARD'S DAIRYMAN:—Each week we look with great interest for our "Dairyman" and read it all as soon as possible. I am a Jersey man. Have a few fine registered ones and have just completed a very nifty little barn. I want to give the readers of the Dairyman just a few tips on whitewashing as now is the time to clean up, get rid of flies and insects, and get ready for winter.

I mix good white lime and soft water until it will spread easy. To each pail I add a cup of common salt and a cup of corn starch. It will make a very nice, hard finish and is suitable for cow barns, hog houses, horse stables, or for any sort of interior work. If it is desired one can add a cup of Creso dip No. 1 and applying with a brush it will fill all cracks and crevices where lice and mites are most apt to harbor. Be as particular applying it as you would paint and it will last a year or more.

Williamstown, Mich. J. B. Y.

In Norway the decline of dairying has caused the government to adopt a system of rationing skimmilk. Since June 17 children under five years are allowed 1¼ pints daily, and persons over 15 years are limited to one-third pint daily.

How Car Builders Meet the Problem of Wear

Nut — valve — engine bearings—steering ball—cone clutch—brake—these and all other important working parts of the modern automobile are designed to allow take-up for wear.

Cars that are the best built and longest lived are the ones that provide some easy take-up wherever wear is likely to affect the adjustment of any working part.

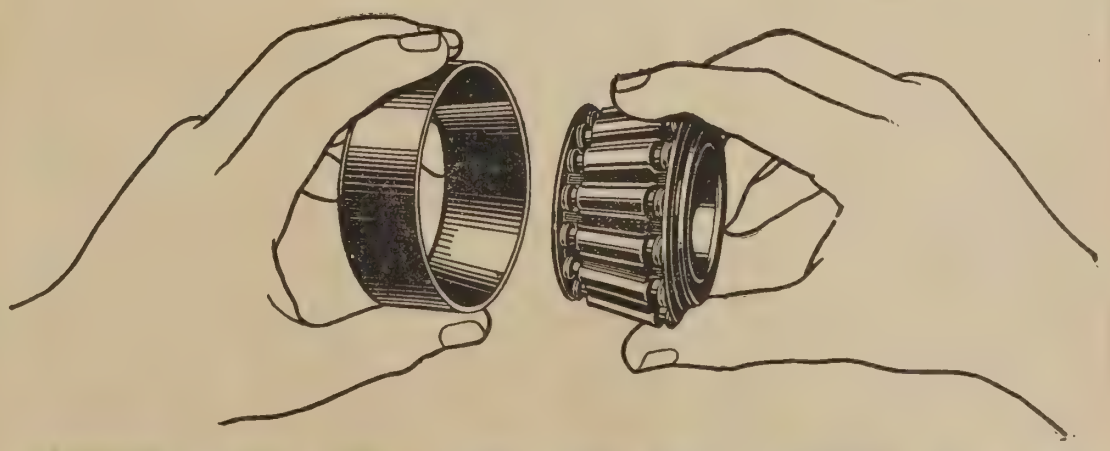
There isn't a working part in the car that's more important than the bearings, not only because bearing repairs cost money, but because bearing looseness may seriously affect the operation of transmission, gears, and the whole rear-axle mechanism.

That's the reason why, as you know, practically every good car that you see has Timken Bearings in it—because Timken is the one type of bearing that can be restored to perfect working condition by the part turn of a nut or the removal of a shim.

The Same Principles Apply to the Tractor

Bearings in the tractor are far harder worked than in any other type of automotive vehicle.

Wheels are under a greater strain, transmission has a far harder job, final drive is taxed more heavily.



If the bearings at these points were not provided with some means of take-up the looseness that develops in any type of bearing would in time affect the operation of the entire machine.

The tractor builder knows that when he provides easy take-up for wear, he is adding both to the usefulness and life of the tractor, and is giving the buyer a far better product with a greatly reduced cost of upkeep.

That's why so many wise builders are engineering Timken Bearings into their tractors at the most important bearing points. The story of the bearing is told in the free booklet, F-99, "Timken Bearings for the Farm Tractor."

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Counting Bacteria in Milk

You all know that milk contains bacteria, tiny organisms so small that they cannot be seen without the aid of a microscope. Sometimes these include disease bacteria such as those that cause tuberculosis or septic sore throat and, of course, such milk is not only unfit but actually dangerous for human use. More often, however, these bacteria are the kind that cause milk to spoil, turn sour, or perhaps be ropy or stringy.

Now, the milkman don't want milk that contains a great number of such bacteria. Such milk won't keep long and, of course, his customers would soon stop buying of him if he continued to deliver a poor grade of milk. Because of this, milk is, in many cities, graded or put in different classes. That which contains but a comparatively small number of bacteria is Grade A. Grade B milk contains more, and so on down.

THE DOTS AND CIRCLES IN THIS SHALLOW GLASS DISH SHOW THE APPROXIMATE SIZE OF COLONIES OF BACTERIA AFTER GROWTH ON AGAR,—AS THEY LOOK TO THE MAN WHO COUNTS THEM.—(New York Bulletin 139.

At once you wonder how anyone can count these bacteria and at first thought it does seem like an endless job, particularly when you know that there may be millions in a single bottle of milk. However, the bacteriologist who does this work takes a very small sample of the milk, a cubic centimeter which is about a teaspoonful. Then he takes 1,000 or 10,000 times as much sterile water, mixes the sample of milk in it and is ready for business.

Next, he gets some agar, a substance made from seaweed, and to this adds water, beef extract, peptone, and perhaps some milk sugar. The bacteria grow well in this mixture which becomes jelly-like when it is cool. While the agar mixture is still warm, a cubic centimeter of the milk and water mixture is added to it and the whole mass shaken well. It is then poured into shallow glass dishes and allowed to cool.

Why was all this done? There were too many bacteria in that first cubic centimeter of milk so it was necessary to dilute it, which was done with the sterile water. Now, don't you see that if we could count the bacteria in one cubic centimeter of the water and milk mixture, and then multiply that number by 1,000 or 10,000 we would have the total number in a cubic centimeter of the original milk.

That is exactly what the bacteriologist does. He leaves the dish of agar in a warm place so that each bacteria multiplies and forms a little colony that can be seen without any microscope. Then, by counting the colonies, he can tell how many single bacteria there were at first, and how many there were in the original sample of milk.

The illustration gives you a good idea of how such a dish of agar looks when the colonies are ready to be counted.

Let's Hear from You

Summer is about gone and a good many of you juniors who have been in business for yourselves are ready to market your stock and your crops. Perhaps you have done so already. Your work this summer should have done at least two things for you. You should first of all have learned to be a better junior business farmer. If you were raising a pig, your work must have taught you better methods of feeding, or if you had an acre of corn, you got some good experience along that line. The other result of your work was a profit in dollars and cents if you were successful.

Now, then, why not let the other fellows know just what you have been doing. They are interested in exactly that kind of work. Perhaps they've been doing it this summer and while some may have had better results than you have, others have not done so well. A letter from you telling how you succeeded and something about your way of working would not only be interesting to other juniors but it would actually help them, because certainly they should be able to learn something from it.

Don't simply write a letter saying you have been doing this thing or that. Write one that will tell about your work, just the way you'd expect other fellows to tell about what they've been doing. All of us would like to read such letters.

If you've a picture of your calf or pig or of your field, send that too. We would like to see it.

Just the other day we were talking with a dairyman who has several sons, one of them a boy of 14. We asked this father if the boys had stock of their own and he told us that the older boys had but that this one never took good care of what animals he had owned and so he would not let him have ony more.

In thinking about this afterward, we wondered if this might not be one reason why some of our Hoard's Dairyman Juniors were not in business for themselves. Have you had a chance to get some stock of your own and then perhaps fallen down when it came to the matter of caring for it? Did you ever get your father to let you have a calf or pig, take good care of it for a while, and then lose interest in the whole business, even to the extent of letting him take care of the animal?

We hope not. We would like to see every Hoard's Dairyman Junior in business for himself, but we certainly would not want any fellow to start unless he expected to finish. If you go to your father and show him that you not only want to get started but that you are willing to earn your start and that you're going to see it through, we believe he will be very glad to help you. Try it and see.

Just a few days after we saw the man referred to above, we called on another dairyman. We found him busy laying a floor in the barn and one of his sons, who could not have been over eleven or twelve, helping him. He was really helping, too, and doing fully as well as a man could.

Later during the course of the conversation, the father told us that this boy and his brother a year or two older had been his only assistants during harvest. Those two boys and their father cut and shocked 80 acres of grain. One fellow drove the binder; the other helped shock. And what was more they had it done about as soon as other farmers in that section. How's that for a record? That father has a right to be proud of those two boys; they certainly proved themselves the right kind of junior farmers.

Our government has taken and is taking thousands of young men from the farms because it needs them in the army. Someone has to fill their places and there is where you come in. You can't go as a soldier but you can feed one and can do a good deal toward filling his place on the farm. Just now it isn't a question of doing your part. That isn't enough; all of us have got to do all we can.

Buys Heifer from his Father

HOARD'S DAIRYMAN JUNIORS:—This is my second letter to the juniors' page. I did not see the other letter in print so I thought I would write another letter. When I wrote the last letter, I was sick with pneumonia for two weeks. You might think I was a tickled boy to get out-of-doors then. Now I am laid up with a wire cut. I had to have the cut sewed up.

I have a little calf of my own which I bought from my father. It is ten weeks old now and is a heifer calf. I am sending her picture to you. We have seven calves besides mine. We feed them a gallon of skimmilk twice a day, all the clover and timothy hay they can eat, and oats, bran, and oil meal. We are milking 19 cows now. We have seven head of horses, one herd bull, and 45 head of pigs. Eleven of our pigs are pure-bred Chester Whites. We are going to have all pure-breds next year. I have 110 chickens in all and three ducks. I hope to see this letter in print. Wishing the juniors good luck, I will close.

Wisconsin. ORVIN L. BURTON.

ORVIN BURTON, A WISCONSIN JUNIOR, AND HIS HEIFER CALF

Junior Letters

Hoard's Dairyman Juniors:—It has been a long time since I have written to the juniors. My Ayrshire is doing fine. My pigs are quite big ones now. We are still sending our milk to the condensery and like it fine. We got $102 for July from 12 cows. Our milk tested 3.3%. The cows are doing better now. We turned them into a clover field.

My brother's cat had 5 kittens. I have a pair of rabbits. They are Belgian hares. Could some of the juniors tell me what to feed them, what time they have young, and what kind of a pen to make them?

We had 55 acres of hay and 55 acres of grain. We are installing a litter carrier at the present. Our milking machine is working fine. We haven't got many apples this year.

My address is Marlette, Mich., R. F. D. 1.

Millard Laidlow.

Hoard's Dairyman Juniors:—I have not written to the juniors since I joined last year. We have ten cows but one is sick. One quarter is all swelled up. It has been that way for two weeks but is getting better now. I have four rabbits. The old doe has had two lots of young this year. The first lot died and when the others were about two weeks old a weasel got in and killed them all. Some of the juniors who have raised rabbits please tell me how to raise them for I have had no luck with them.

Daddy has twelve pigs. He gets about ten gallons of milk and feeds it to the hogs after separating it. I am going to organize a pig club next spring. Will some of the juniors please write me a letter? My address is Leedstown, Va.

Lewis Hayes.

Hoard's Dairyman Juniors:—It has been a long time since I wrote because I was busy helping my father this vacation. I have already told you about our agricultural club and it will end September the fourteenth. Then the prize will be given. My pig now weighs about 160 pounds and I hope to get a prize for it. I will write to you again after the contest and tell you all about it. My calf is growing fine and I turned him out in the pasture.

My father has a milking machine and I am learning to handle it. I put it on most of our cows. I cannot think of anything else to say so I will close wishing the juniors good luck.

California. Lino Franscioni.

Hoard's Dairyman Juniors:—Ever since the Hoard's Dairyman Juniors were organized I have had an idea that I knew the juniors would fall in with, but have never had a chance to write about it. Why can't the juniors of the different states in the Union correspond with each other? In this way the juniors of the North would learn about the juniors of the South, and the juniors of the East would learn about the juniors of the West. They could exchange pictures of their homes, pets, of the landscape, and of themselves. This would prove to be not only instructive for the juniors, but it would be great fun. They could learn about each other's way of farming, ideas, and, best of all, about

the country and what the land is best adapted for. In this way if a junior, after he had grown up, decided to move to another state, he would know what to expect. So, you see the benefit derived by so doing. If any of the juniors would like this idea, they may write to George C. Strong, Water Mill, Long Island, N. Y.

I live on a small dairy farm on the eastern end of Long Island. There is not much dairying around here as the land is high in price, and pasture land is scarce, potato growing being the principal industry. But I wish it was otherwise, as I think that the dairy business is one of the most honest, healthful, and pleasant occupations anyone could wish for. I am sixteen years old and in the senior class in the high school, which is three miles away, but I do not mind that much as it is sport on a motorcycle and in bad or cold weather in winter the walk is pleasant and does me good. I am nearly six feet in height and a wonderful eater.

New York. George C. Strong.

Hoard's Dairyman Juniors:—It has been a long time since I have written but I have been very busy this summer.

We have been trying to stack grain, but we can only stack a half a day at a time as it rains a few days and then quits and as soon as it is dry enough to stack again it will rain.

Our barley started to grow in the shock. We have about thirteen acres of wheat yet to stack. This we think will go between 25 and 30 bushels to the acre. We have 45 acres of field corn and 12 acres of silo corn.

Papa gave my brother and me each a heifer calf this year. We are going to break them and drive them in parade at the Dakota County Fair.

Last winter we broke our two dogs so we can drive them single or double and we are also going to drive them in the parade.

We have two Scotch Collie pups for sale. The mother is a full blood and we have her pedigree. Our neighbors, who own the father, say that he is also a full blood but they have no papers for him.

We have 77 hives of bees now. We had 79 but the moths killed two of them.

We have fifteen spring pigs and two old sows. The sows eat chickens and our neighbor told us to feed them tankage and that would stop them. We did this for a long time but they kept on eating them so we are gong to pen them up and fatten them.

We have bought a light six car and we traded a bay mare in on it for $180, but we still have her here.

As my letter is getting long I will close wishing all juniors good luck.

Minnesota. Walter Nelson.

Hoard's Dairyman Juniors:—This is my fourth letter I have written to you. We have our oats all cut and shocked. Some of the people are threshing their grain. They have a 25 H. P. engine and 36-inch separator. We are thinking of getting a small threshing machine to run with our 12 H. P. engine. We have a small corn husker and a silo cutter. We grind feed for the pigs and cows with our engine, too. My little engine does all kinds of work like running the milking machine and pumping water and running the grindstone. We are going to thresh next week. My calf is getting bigger every day.

Well, I think it is time to close, hoping good luck to all the juniors. Gordon Hengstler.

Hoard's Dairyman Juniors:—I have not written for quite a while. We had a Brindle heifer come fresh last Saturday. She had a heifer calf that we think a great deal of as we only have three so far from our bull. In your letter you asked me if my colt was draft or roadster type. She is of the roadster type. I have her on pasture now; she is fat, sleek, and pretty. Yes, I still have my heifer. She is only giving about 11 pounds of milk a day now as she will be fresh in November. Our sow brought eight pigs. I traded my bull calf for one. Our sow will farrow again in September. Papa traded a horse for a cow, calf, and some wood and posts. I found a volunteer potato the other day with seed pods on it. We have all of our crops up. The frost killed our fruit this year.

Papa put up a silo and filled it with wheat, oats, oats and peas, and peas. The cows are on the stubble and we are feeding silage. There are only two or three other dairymen here besides papa, and I sold them Hoard's Dairyman.

I bought three rabbits, one gray and white one, and two white ones; the gray one died. I made a rabbit hutch last week. I liked the "Pettis County Calf Club" very well and would be glad if our agriculturist would organize a calf club. Wish the juniors would write to me. My address is Elgin, Oregon, R. D. 2. Robert Galloway.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. Ralph Hutchins was up to my neighbors the other day so I went up to see him. He said that he had written a letter to the juniors.

I belong to the pig club and garden club.

I am 12 years old and in the seventh grade. I made two grades last year.

We are milking five cows. I milk two cows. We have ten heifers and one pure-bred Guernsey bull. His name is Krit.

My address is Lyndon, Wash., Route 1.

Clifton C. Alling.

CHANDLER SIX

FAMOUS FOR ITS MARVELOUS MOTOR

Let Your New Car Be a Real Car

NEARLY fifty thousand Chandler owners, many of whom are farmers, know how powerful and responsive, how economical, how dependable and enduring the Chandler car is.

"Greatest of all light sixes" never more accurately described the Chandler than it does today. If you wished to search the whole market with minute comparisons and tests this would be your answer, too.

In the ownership of a Chandler Six you will possess a really great automobile—great from the standpoint of mechanical excellence and daily performance under all road conditions, great from the standpoint of economy in operation and maintenance.

Thousands of Chandler owners tell of gasoline mileage of fifteen to seventeen miles per gallon. Seven thousand to nine thousand miles per set of tires is the usual Chandler report. Owners and dealers alike say the service upkeep of the Chandler car is much less than that of other good cars which they have owned or sold.

You want and need the best of equipment on the farm. The automobile is part of your equipment. Let the new car you buy this Fall be a *real* car. Let it be a big and fine, yet light and economical, car that you can depend on.

Choose the Chandler for Your Car

7-Pass. Touring Car, $1795 *4-Pass. Roadster, $1795*
Four-Passenger Dispatch Car, $1875
Convertible Sedan, $2495 *Convertible Coupe, $2395*
All prices f. o. b. Cleveland

There are Chandler dealers in all principal cities and in a thousand towns. Some one of them is in position to show you the newest Chandler models. Write us today for catalog and folder "How Chandler Checks with High Priced Cars"

Single man desires position as dairy farm manager or herdsman. Graduate of agricultural college, age 27, life experience on farm and the past 4½ years in charge of large herds in the East. Has made several good A. R. O. records and is familiar with production of certified milk. In deferred class. Good references furnished. BOX 238, care Hoard's Dairyman.

Position wanted by thoroughly proficient herdsman or manager. Any dairy proposition considered. Married, one child, years of experience, including one year of cow testing association and A. R. O. work, special dairy course graduate. Pure-breds desired. Excellent reference. Address OLIVER GIRKIN, Gilman, Iowa.

Situation wanted by married man as dairyman, manager or herdsman. Experienced in all up-to-date dairy machinery and A. R. O. work. No objection to boarding help. BOX 239, care Hoard's Dairyman.

Position wanted—As herdsman by single man over draft age; sober, no tobacco used. About 15 years of practical experience in testing, balancing rations, calf raising, plain veterinary work. Position must be A No.-1 in respect to equipment. Holsteins preferred, where 7-day and yearly work is done. State in first letter particulars and compensation you can offer. Address E. D., care Lew Dale, Lawton, Mich.

Position Wanted—As manager of stock or grain farm. Experienced first class man. Married, no children. Address E. R. B., 531 Dean St., Woodstock, Illinois.

Young married man, draft exempt, with six years' experience in general farming, desires position on farm. No children. References. BOX 237, care Hoard's Dairyman.

A Corn Crib Proclamation

To All Anti-American Rats:

Be not discouraged by the almost at cuteness of these Americans in building their cornhouses on little piers with curved slippery sheet-metal over the caps just under the floor joists. We find that these men soon forget what they have learned, and fall back into weak, careless customs.

This fall, when you begin to return from the fields to your winter homes, hopefully look to see if some man has not left a ladder conveniently leaning against the door, or—what is just as good—has used the shelter of the building to make a pile of farm tools reaching from the ground high enough up for you to climb within jumping reach of the cracks in the floor.

Once inside, you need not worry about these stairways being taken off.

WILHELM, KAISER.

Holsteins At Auction

FOURTH ANNUAL SALE

Southwestern New York Holstein Breeders' Association

RANDOLPH, NEW YORK, SEPTEMBER 27th, 1918

70 Registered Holsteins—All Over Six Months of Age Tuberculin Tested.

In this sale will be found 70 high class representatives of the best herds in Southwestern New York. They are all of good age, in sound physical condition and will be guaranteed as represented. Several of them have good A. R. O. records, others are from tested dams, and are sired by prominent and highly bred bulls. The females that are in calf are bred to some of the best bred bulls of the breed. A wonderful opportunity to buy cattle of the better kind.

You should attend this sale. If you can't buy a herd buy a heifer.

Sale Managed by Liverpool Sale & Pedigree Co., Inc., Liverpool, N. Y.

The principal dairy states will waste, this winter, 3½ Billion Pounds of Milk

Simply by failing to get it; failing, too, when it would be easy to produce that increase for a world market that demands every possible ounce of food.

Surely this is not the time to overlook any opportunity for increased dairy production and profit. It is no time for waste or neglect. The bending of every effort toward bigger dairy results, for both patriotic and personal reasons, is the duty of every dairy farmer. Here is one way in which the dairy farmers of the principal dairy states could add this winter 3,600,000,000 more pounds of milk. At $3 per cwt. this would mean $108,000,000 more profit.

These are not wild figures. They represent bed-rock facts, and they mean that if all the cows in the principal dairy states were properly watered with James Drinking Cups they would add 3½ billion *more* pounds of milk to this winter's yield—milk that would be worth to the nation as a whole, and to you in part as a producer, at only $3 per hundred, more than a hundred million dollars.

A tidy sum for the dairymen of this country to think about, isn't it? A sum well worth saving in *any* year, but especially so in this period of advancing food prices, increased milk demand and costly feed.

Then there's your own question of labor, and the protection of your herd from disease, to be thought about in this great crisis. James Drinking Cups give each cow clean, safe water that no other cow has had her nose in. They do away with the hard, cold job of herding the cows out to the tank, herding them in again—chopping open the frozen tank.

There are two shortages for you to think about: The world-wide food shortage, and your own pocketbook shortage caused by your cows not getting all the water they want, *when they want it*, at the right temperature, day or night.

They will give more. All they need is the opportunity. James Drinking Cups spell that opportunity. The milk increase of the average cow will *pay for her cup* in 90 days. At the end of that time the account covering the complete installation will be *squared* as a result of increased profit, leaving you the cups for many years of money-making service, either in your present barn or when re-installed in a new one.

Do *your* part toward getting the extra millions which American dairy interests can produce by making milk out of water. Get *your* share of those dollars. It's easy to buy, easy to install and easy to operate James Drinking Cups. We've solved this great watering problem, and solved it *right*—just as we have so many other questions relating to sanitary barn equipment. Write today for booklet, "How to Make More Milk."

When Alladin Rubs His Lamp

(Continued from first page)

have spent a mint of money in the past few months to further their evaporated and condensed milks—and no one doubts but that the object is rapidly being achieved. Their advertisements are decidedly attractive. They feature tempting new recipes and life size colored photographs of same so that it makes a born cook's hands itch to get into the kitchen to try her luck with their "tin cow". They have won their way, these advertisements, into a million housewives' hearts and their only rivals at present in their eyes are Carnation milk and some others, which so far have not exploited their products on quite such a large scale. What these people can do with advertising, what they put their tight dollars into—we can do. It is indeed a pity if either of these concerns or any other who buys our milk, can put up more money to sell it than we, the united producers, can put up. That would be too ridiculous a supposition.

We can be grateful, of course, to the condenseries for the only exploiting our product receives at present, but we should jump into the game "all over" at last and prepare the consumer to buy more bottled milk, more cheese, ice cream, and butter. Our aim would not be to raise prices exorbitantly—it would be to raise more cows, rather, than prices, and if possible, to reduce the latter as demand and consumption increased.

The Food Administration is now helping us nobly. Science is on our side and has proven that we are alone in the field as far as health goes. It only remains to take advantage of our position before it is everlastingly too late and stir the public into milk and butter and cheese fans also.

"Money makes the mare go" and today advertising is the force that drives us. It is time to call this force to our aid and let it put our products into the limelight. We can take a lesson from the automobile manufacturers, the Sunkist growers, the kodak man, and in a year find an undreamed of market clamoring for more dairy produce. Can't we manage to find the necessary sinews of advertising and also the milkman of the hour and then "go to it"?

Advocates Discontinuing Delivery of Milk

HOARD'S DAIRYMAN:—I have seen a good deal in the daily press about the cost of distribution of city milk and I see by your last issue you are also interested. The question in my mind is, "Why distribute?"

As a boy I was responsible for our family supply and went four squares twice daily for it. What pressing business have the city children today that would hinder them from the same errands? One of the great lessons of the present conditions is teaching the people to help themselves and be more independent of service.

A rough outline of my idea follows:

Selecting a city of good size let a straw vote be taken by precincts under police or volunteer supervision for or against the present system of distribution. Those precincts showing a lack of interest or no vote to continue as at present with no restriction on price.

Those wishing to change to be supplied as follows: Let the city accept bids from store keepers to handle the supply during, say, two hours night and morning, under proper board of health restrictions, the number of dealers to a precinct being proportioned according to population, successful bidders to be licensed, and license subject to forfiture for cause.

In such precincts no delivery to be made except wholesale,—small restaurants, etc., to go for their supply same as families.

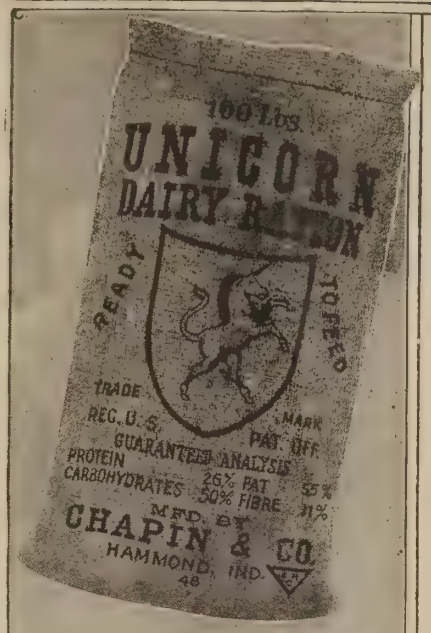
Supply at these depots to consist of, say, two grades of milk according to fat content, one in bulk, and one bottled, and perhaps one grade of bottled cream. Price for this supply to be figured by a commission on a sliding scale as near just to producer and consumer as possible, delivery at depots and dealers' per cent to be a fixed sum. Excess supply at depots at close of delivery hours could be used by city institutions or taken care of by wholesale consumers.

Fixed hours would lessen burden on dealers and these depots would be easily inspected and city's responsibility on bulk milk would end on delivery to consumer. Those living in precincts having delivery and wishing depot milk would not be likely to have a great distance to go.

This would put the burden of distribution where it belongs, on those who wish to pay for such service. What distributors choose to ask because of curtailed routes would be nobody's business. The distributors would possibly oppose such a plan and perhaps the vote would have to be better guarded, but people are beginning to take things in their own hands and I believe some such plan would appeal to enough in moderate circumstances, and particularly to those of foreign birth, to give it a trial if properly presented and understood.

At most it would cost very little to experiment with some such plan and in event storekeepers failed to see the advantage of a string of customers twice daily, the city would be free to establish depots under the commission supervision.

Holland, Mich. H. W. H.



Sudan Grass Pasture for Cows

The New Mexico Experiment Station reports that a 7-acre plat seeded April 19 to Sudan grass was divided into two parts, and after 60 days 12 cows were turned on one of the fields. After a few days it was found that 12 cows were not sufficient to catch up with the growth the pasture was making, and 8 more cows were added for 12 days. The two fields were irrigated and pastured alternately during the season, the change being made at intervals of about two weeks. Heavy rains came about the middle of October, making these fields too muddy for use, and the cows were given a small grain ration, averaging 4 lbs. per head. The 12 cows were divided into two lots, and the grain ration was alternated from one lot to the other every 30 days.

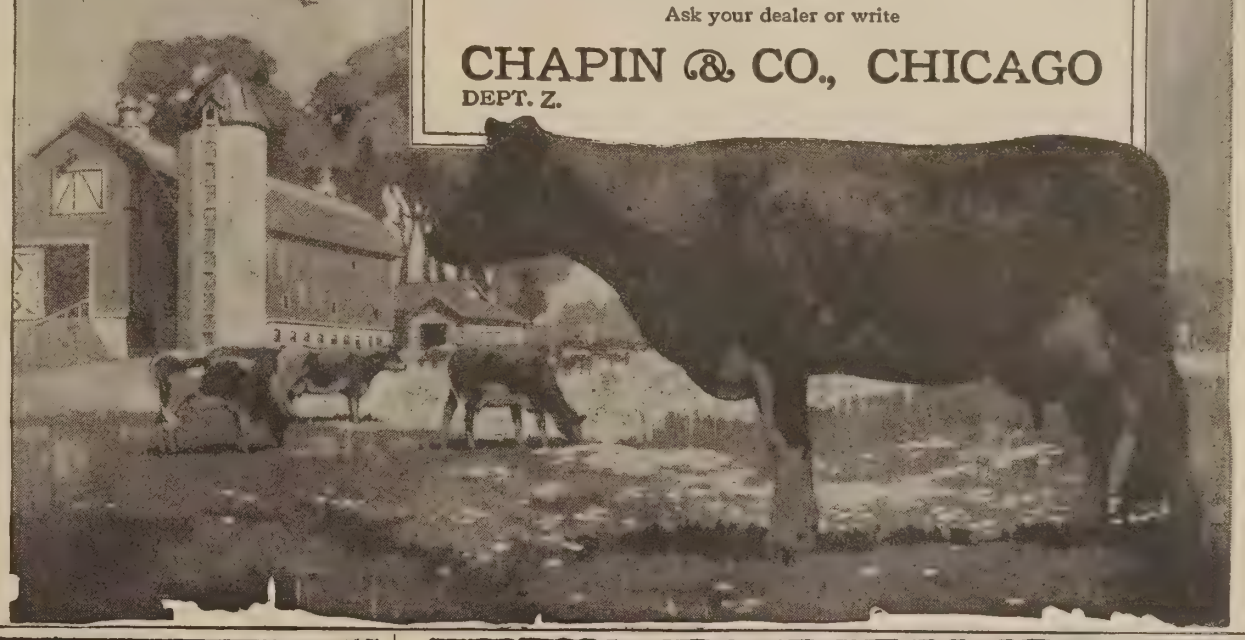
The results of this part of the experiment indicate that it does not pay to feed a grain ration to cows running on good pasture. During the four months that the cows were on pasture they gained an average of 19 lbs. per head, and gave 27,422.5 lbs. of milk, which contained 1,096.9 lbs. of milk fat. The 8 dairy and beef cows that were temporarily on the pasture gained 18 lbs. per head in 12 days. The pasture carried an average of 2 cows per acre for four months. There was no indication of poisoning by pasturing this grass in November after the frost came. The results of this test indicate that Sudan grass should prove to be a valuable supplement to permanent pastures during the summer under dry land conditions.

Before the war the United States received dairy products from no fewer than 24 foreign countries; now these supplies have been largely stopped and it has become necessary not only to replace them at home but also to export large quantities.

UNICORN DAIRY RATION

¶ **Mr. Carter**, of Asheville, N. C., after visiting the dairy sections of Ohio, Illinois and Wisconsin to buy some superior milk cows, purchased a promising young heifer at Wauseon, Ohio.

¶ Mr. Carter discovered that **Unicorn Dairy Ration** was being fed to nearly all record breaking cows, and adopted it for his feed.



¶ In a 30 day test at 4 years old **Wauseona Pansy Korndyke Queen** produced **2080 lbs. Milk.** She was charged 72 cents per day for Unicorn Dairy Ration, roughage and labor, leaving a net profit of $2.50 per day.

Unicorn Dairy Ration

like **good** cows, costs more than the inferior article, but pays a larger profit.

Wagons That Stand Up

BEAR this point in mind the next time you buy a wagon—**Columbus and Weber wagons are guaranteed to stand up under capacity loads.** You don't have to be a wagon expert to buy a **Columbus** or **Weber** wagon safely. All you really need to know is the weight of your heaviest loads. Buy a wagon marked to carry that load and we guarantee safety and satisfaction worth more to you than all the talking points of all the wagons in the market put together.

Ask any dealer who carries **Columbus** or **Weber** wagons to show you just what we mean by this statement, or write to us for full information. Our wagons have many good features—the International fifth wheel, the sandboard wear plate, link end rods, folding end gate, superior material—more features than you will find on any other wagon. All these help to give the good service, long life and economy that you get with **Columbus** or **Weber** wagons. See the wagon or write to us before you buy again.

grand champion, winning in his class over Oxford Gipsy's Lad, a $2,700 bull purchased at the 1918 Butler sale by C. C. Weber and W. S. Dixon. Jolly's Prince Jack, junior yearling junior champion owned by C. R. Brackett, made a good try for the premier honors among the males.

The grand champion cow was Fontaine's Gray Linnet owned by C. C. Webber. She was easily winner in her class, excelling her competitors in development of middle capacity and udder and vein capacity, as well as shape of udder. Brackett's aged cow, Fairy's Boy's Lobelia, would have offered good competition had she been in milk.

The list of awards follows:

Bull 3 years or over—1, Slade on Noble Prince Jolly; 2, Dixon on Oxford Gipsy's Lad; 3, H. L. Elliott on Combination Noble Judd; 4, Clark on Keepsakes Golden Lad 3rd; 5, Love on Jolly's Eminent Boy. Senior yearling bull—1, Schneider on Zenith's Jersey Lad. Junior yearling bull—1, Brackett on Jolly's Prince Jack; 2, Love on Golden Noble's Count; 3, Clark on Lady La Zone's Laddie. Senior bull calf—1, 4, and 5, Clark on Nerissa D's Jolly Boy, Miss Narcissis Lad, and Lad's Cream Boy; 2, H. L. Elliott on Bissa's Combination Chief; 3, Webber on Oxford Majesty of M. F. Junor bull calf—1, Slade on Panola's Oxford Jolly; 2, Webber on Fontaine's Majesty of M. F.; 3, Clark on Lad's Perfection; 4, Brackett on Corra's Dandy Noble; 5, Love on Belle's Friforshire.

Cow 4 years or over—1 and 4, Webber on Fontaine's Gray Linnet and M. H. Owl's Sayda's Lois; 2, Brackett on Fairy's Boy's Lobelia; 3, Clark on Lad's Lady LaZone; 5, Slade on Panola's Oxford Ixia. Cow 3 years, under 4—1, Slade on Fern's Oxford Ever; 2, Schneider on Maple Lawn's Songbird; 3, Clark on Cream of Meadow Creek. Cow 2 years, under 3—1, Clark on Eileen LaZone. Senior yearling heifer—1, L. C. Elliott on Mayflower's Cupid Pride; 2, Webber on Hamptonne's l'Etacq; 3 and 5, Clark on Lad's La Bute and Diamond Cream; 4, H. L. Elliott on Topsy's Cupid Jewell. Junior yearling heifer—1, Slade on Cupid's Oxford Panola; 2 and 3, Brackett on Mon Plaisir's Goldie 2d's Lass and Dandy's Cornubia; 4, H. L. Elliott on Mable's Combination Brenda; 5, Webber on Moreton Field's Golden Lena. Senior heifer calf—1, Brackett on Carola's Rosinette; 2, Clark on Lad's Favorite Sunbeam; 3, Schneider on Financial Fern Princess; 4, Fox on Mayflower's Dandy Jolly. Junior heifer calf—1 and 5, Clark on Lad's Cream Beauty and Irena Golden Lass; 2, Slade on Brenda's Princess Jolly; 3, H. L. Elliott on Noble Combination Pearl; 4, Brackett on Dandy's Viola Plush You'll Do.

Graded Herd—1, Clark. Young Herd—1, Brackett; 2, Clark; 3, Love. Calf Herd—1, Clark; 2, Brackett; 3, Love. Get of Bull—1, L. C. Elliott; 2, Clark; 3, Brackett; 4, Love. Produce of Cow—1, H. L. Elliott 2, Slade; 3, Clark; 4, Brackett; 5, Love.

Senior and Grand Champion Bull—Noble Prince Jolly. Junior Champion Bull—Jolly's Prince Jack.

Senior and Grand Champion Cow—Fontaine's Gray Linnet. Junior Champion Cow—Mayflower's Cupid Pride.

Guernseys

Exhibitors: A. W. Bragg, G. A. Chaffee, Everhardt Bros., A. L. French, Island Farm, Mayowood Farms, Ott Bros., Jno. D. Ruble, Geo. C. Stone, Victor Stiehl, Chris Skarr, M. S. and C. A. Skarr, and D. D. Tenney from Minnesota, and W. W. Marsh and Mountain Bros. from Iowa.

Judge: J. L. Hope, New Jersey.

Fifteen breeders with 117 entries led the strongest Guernsey classes into the ring which the Minnesota fair has ever seen. There were no unworthy animals, the entire exhibit being one of high merit.

The major part of the winnings were quite evenly divided among the Tenney, Island Farm, and Marsh herds, Mountain Bros. taking the only blue which did not go to one of these three. Particularly in the bull classes, the Cherub blood showed up well, bringing honors to the Marsh, Mountain, and Tenney herds in every class where the get of Imp. Hayes Cherub 2d or Ladysmith's Cherub appeared. Island Farm won firsts in the first three female classes shown, in the three- and two-year-olds on get of Gold Lassie's Julian whose get are making exceptionally good records of production.

Favor went to Ladysmith's Cherub as quickly as the aged bulls came into the ring. He was fitted and shown at his best by "Happy" Allen and had a more vigorous appearance, more scale, and more strength throughout than Imp. Kenilworth Gold, the Marsh winner at Des Moines, whose chance for honors depended on his smoothness and quality, superior rump and thighs, and the chance that the Tenny bull would start the circuit in the high flesh he carried at Minnesota last year. Mountain Bros.' Cherub's Winner came back to second place, defeating both the Marsh and Island Farm bulls which were lined up ahead of him at Des Moines.

Mountain Bros. won in the two-year-olds with Imp. Kitchener's Express but lost to the aged sire in senior championship. The yearling winner, Cherub's Prince, a strong, growthy bull which "Jimmie" Lee says will mature to near 2,000 lbs., did not receive the favor among the juniors which his development would seem to earn for him. Junior honors went to Cherub's Sergeant of Shorewood, a showier bull of a bit neater type.

Island Farm made its best showing in the females. Imp. Bella 2d Du Grand Fort, Sedalia and Des Moines grand champion, was a clear winner of the purple at Minnesota. She was dry as was her close contendor, Imp. Rosette of Marais Farm, from the Tenney line-up. The Island Farm cow was superior in scale and in depth, as well as in balance of udder as the cows showed, and easily held her place. Her two-year-old daughter gave her good competition for senior championship where the two met the three-year-old winner, Starlight May Rose, also from the Island Farm herd. In the senior heifer calves Island Farm won first and second with get of Beda's May King but lost to Tenney for junior championship on Cherub's Miss Madamoiselle of Shorewood.

The list of awards follows:

Bull 3 years or over—1, Tenney on Ladysmith's Cherub; 2, Mountain Bros. on Cherub's Winner; 3, Marsh on Imp. Kenilworth Gold; 4, Island Farm on Gold Lassie's Julian; 5, Stone on Caribou King Albert. Bull 2 years and under 3—1, Mountain on Imp. Kitchener's Express; 2, Ott on George of Chesney Farms. Senior yearling bull—1, Marsh on Cherub's Prince; 2, Island on Maxim of Linda Vista; 3, Chaffee on Cora's Noble King; 4, Stone on Caribou Romulus. Junior yearling bull—1, Marsh on Ruby's Cherub of the Prairie; 2, Mountain on Cherub's Glenwood of Iowanola; 3, Stone on Caribou Manager; 4, Mayowood on Governor's Sequel Chene; 5, Ruble on King Masher Major of Cloverlawn. Senior bull calf—1, Tenney on Cherub's Sergeant of Shorewood; 2, Stone on Caribou Corporal; 3, Mountain on Florinda's Winner of Iowanola; 4 and 5, Marsh on Lily du Prel's Prairie Gold and Marie's Cherub of the Prairie. Junior bull calf—1, Tenney on Cherub Ace of Shorewood; 2, French on Gay Lad of Fair Meadows; 3, Stone of Caribou Golden Secret; 4, Skaar on ————; 5, Island on Princess's Jewel of Island Farm.

Cow 4 years or over—1, Island on Imp. Bella du Grand Fort; 2 and 3, Tenney on Imp. Rosette of Marais Farm and Imp. Altha of Sarnia; 4, Stone on Sequel's Marie of Schuylkill; 5, Mayowood on Imp. Rouge 4th of Mt. Plaisant. Cow 3 years, under 4—1, Island on Starlight May Rose; 2, Skaar on Virginia of Pine Ridge. Cow 2 years, under 3—1 and 5, Island on Bella's Gold Lassie and Bella's Golden Lassie; 2, Tenney on Bell Buoy's Golden Lassie of City View; 3, Marsh on Ingleside Pretoria Vrangue; 4, Bragg on Select's Primrose. Senior yearling heifer—1 and 2, Marsh on Imp. Pro. Rose des Houard and Felios of the Prairie; 3, Skaar on Esther of Cor-Alfa Farm; 4, Stiehl on Clara's Hazel of Maplewood; 5, Stone on Caribou Mary. Junior yearling heifer—1 and 3, Marsh on Golden Cherry of the Prairie and Bopeep Queen 2d; 2, Mountain on Golden Queen of Iowanola; 4, Tenney on Pearl's Golden Secret Girl; 5, Skaar on Bonny of Cor-Alfa Farm. Senior heifer calf—1 and 2, Island on Beda Maid of Island Farm and Milvia's Beda of Island Farm; 3, French on Bonnie's Olive of Fair Meadows; 4, Mayowood on Gov. Fillpail's Pride; 5, French on Dairymaid's Rose of Fair Meadows. Junior heifer calf—1 and 3, Tenney on Cherub's Miss Madamoiselle of Shorewood and Cherub Ultra May Rose of Shorewood; 2, Mountain on Imogene of Iowanola; 4, Stone on Caribou

BRAVEEN OF SYLVANITE 83614

Special Features

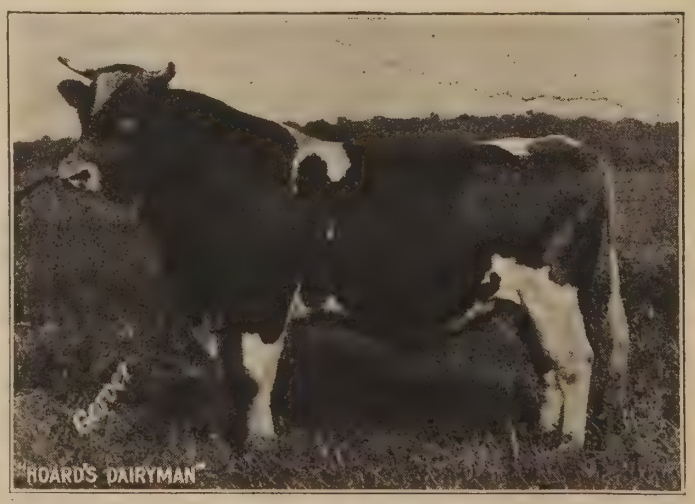
A beautiful granddaughter of Starlight's Excelsior that was never beaten in the show ring.

Two granddaughters of Imp. Froome's Queen, world's champion long distance cow.

A daughter and two granddaughters of Governor of the Chene, a premier A. R. sire, now on A. R. test.

Nine choice May Rose heifers.

BRAVO OF RICH NECK 4TH 50885



KLEMM'S
Guernsey Dispersion
Oct. 4th, 1918, Baraboo, Wis.

On account of the draft Mr. Richard F. Klemm, Prop. of the Sylvanite Dairy Farm, has found it necessary to sell 22 head of pure-bred Guernseys. This herd is on the *state accredited list* and contains much choice A. R. foundation stock.

Send for catalog to

RICHARD F. KLEMM, BARABOO, WIS.

Auctioneers: Col. J. E. Mack, Col. J. R. Love.

BRAVO OF RICH NECK 35937

The cut of our herd sire, Bravo of Rich Neck 35937, and those of his four daughters give some idea as to the individuality of the animals to be sold in this sale. These cuts also prove that the superior breeding of our herd sire is matched with faultless individuality and best of all, that he is capable of transmitting these desirable qualities to his progeny.

Bravo of Rich Neck is by Splendide of Rich Neck 16751 A. R., that has 3 daughters above 500 lbs. fat with first calf, and is out of Imp. Froome's Queen 28706 A. R. that has 5 A. R. records, two above 700 lbs. She is the world's long distance champion, carrying a calf 7 months on an average while making her 5 phenomenal records. Here is a chance to buy a real herd bull.

FROOME'S QUEEN OF SYLVANITE 83613

Other Attractions

An A. R. roll of honor daughter of Imp. Clara's Sequel, the greatest living imported Guernsey bull.

A May Rose yearling bull whose dam and grandam are class leaders.

Three May Rose cows on A. R. test, one by a grandson of Imp. King of the May, one by a grandson of Imp. Golden Secret, the third by a half brother of the $10,000 bull, Don Diavolo of Linda Vista.

BRAVO OF RICH NECK 3RD 50884

osie; 5, Mayowood on Wellington's Sequel. Graded Herd—1, Tenney; 2, Island; 3, arsh; 4, Stone; 5, Ott. Young Herd—1, arsh; 2, Island; 3, Mountain; 4, Stone; 5, aar. Calf Herd—1, Tenney; 2, Island; 3, one; 4, Mountain; 5, Marsh. Get of Bull—1, arsh; 2, Tenney; 3, Island; 4, Stone; 5, ountain. Produce of Cow—1, Island; 2, aar; 3, Marsh; 4 and 5, Stone.

Senior and Grand Champion Bull—Lady-mith's Cherub. Junior Champion Bull—herub's Sergeant of Shorewood.

Senior and Grand Champion Cow—Imp. lla du Grand Fort. Junior Champion Cow—herub's Miss Madamoiselle of Shorewood.

Food Facts of Other Lands

The Canadian wheat harvest is esti-ated at 280,500,000 bushels, about per cent above that of 1917.

The New Zealand government has ade arrangements to take over the tire wheat crop of that country at .41 per bushel. The present out-ok is for an average yield.

Rationing of cheese in Switzerland s been in force since June 1. The lowance is one-half pound per per-n monthly.

The prominence which the Ukraine ea of Russia has received as a urce of foodstuffs for Germany ids unusual interest to its flour and ead prices. On May 20 the price wheat bread in the Ukraine was out 40 cents per pound loaf; and ur 39 cents per pound. These ices, which are about four times as gh as in the United States, are sed on present currency equiva-nts.

Effects of inadequate food distribu-n on prices are shown in Russian ports. Late in April of this year, tter was selling in Moscow for 98 cents per pound, while in Petrograd, 406 miles distant, the price was $3 per pound.

This condition emphasizes the present importance in all countries of using locally produced foods as much as possible in order to insure adequate transportation and bring about fairly level prices for foods in general.

At the beginning of the 1918 crop year, the Prussian State Office for Foodstuffs and Eggs ordered that poultry keepers must deliver to the government from 25 to 30 eggs for each hen kept. In many districts, however, the minimum compulsory delivery was raised to 50 eggs. More lately the state office has ruled that one hen is to be allowed free for each member of the household, prisoners of war not included.—U. S. FOOD ADMINISTRATION.

Hog Regulations

The Wisconsin Department of Agriculture desires to encourage increased production of swine and will co-operate with farmers and breeders in every way possible. Safeguarding the industry from unnecessary losses is one of the activities in which it is particularly interested, and with this in mind the Veterinary Board, at its recent meeting, passed the following regulations governing the movement of swine into and within the state.

Regulation 1.—Swine cannot be removed from public stock yards to points within the state unless immunized by the administration of serum—or serum and virus—and held in clean pens for 3 hours before being loaded in clean and disinfected cars. They must also be shipped under a permit provided by the Wisconsin Department of Agriculture, and must be held in quarantine on arrival at destination for 21 days. The owner shall report weekly as to the condition of said swine which shall be released from quarantine at the end of 21 days provided they are apparently healthy. In force and effect after Sept. 1st, 1918.

Regulation 2.—It is hereby ordered that the use of garbage as hog feed is prohibited unless said hogs have been immunized by the administration of anti-hog cholera serum and virus. In force and effect on and after Sept. 1st, 1918.

Regulation 3.— It is hereby ordered that all stock yards be designated as exposed to hog cholera and that the railway companies shall be required to post in a conspicuous place a card furnished by the Wisconsin Department of Agriculture warning all farmers and breeders of the danger they incur by visiting such places. It is further ordered that these cards shall be renewed when destroyed by weather or other conditions. In force and effect on and after Sept. 1st, 1918.

The co-operation of farmers and hog breeders is earnestly requested in the effort to check losses from hog cholera and the following suggestions on the important points in hog cholera control are offered for their consideration. Comply with these simple precepts and in time we can eliminate the disease entirely.

Suggestion 1.—Don't buy swine out of a local or public stock yard unless they have been vaccinated, and even then they should be dipped in a disinfecting solution and kept isolated for 21 days before being placed with healthy hogs.

Suggestion 2.—Watch your herd closely at this time. Harvest activities—the movement of threshing crews, etc., makes this period most dangerous in the spread of hog cholera. If you notice any of your hogs sick, don't delay; isolate them at once, and have the trouble diagnosed as quickly as possible. Remember that hog cholera serum is a preventive—not a curative agent, and it should be used as early as possible.

Suggestion 3.—If hog cholera breaks out in your herd, vaccinate at once—destroy the carcasses of all dead hogs. Kill all hogs that do not fully recover, and clean up the premises as quickly as possible. Then spray thoroughly with a strong disinfecting solution.

Suggestion 4.—Don't ship light or unfinished hogs to market because cholera has appeared in your neighborhood. It is unnecessary and a needless loss. Vaccinate them and carry them to the finished product.

Suggestion 5.—All city garbage contains the germs of hog cholera and, therefore, garbage fed hogs are exposed to this disease constantly instead of once or twice in a lifetime as is the case with grain fed hogs. It is, therefore, absolutely necessary that hogs that are fed garbage should be protected against cholera by vaccination.

Bulletin No. 17, containing state and interstate regulations governing the movement of swine with suggestions in reference to hog cholera control, has been issued by the Wisconsin Department of Agriculture and will be sent free to all interested persons upon request.—WIS. DEPT. OF AGRICULTURE.

Dr. T. L. Harrington of Milwaukee, Wisconsin, sold his pure-bred Holsteins on September 12th and has entered the army as a commissioned officer. It is his intention to again take up the breeding of Holstein cattle after the war.

13,036 lbs. MILK—720 lbs. FAT
is the average production of the grandams of our Owl-Interest bull calf No. B. 68, dropped April 20, 1918.
His sire is Sibley's Interested Prince, R. of M., who is transmitting the production and richness of his dam, 15,147 lbs. milk, 875 lbs. fat.
His dam is Mertha's Temisia, now on test, 3,128 lbs. milk, 163.8 lbs. fat in 3¼ months to date. Her dam made 10,925 lbs. milk, 565 lbs. fat at 11 years, 10 months old.
MOOSE HILL FARMS, Spencer, Massachusetts

Lookout Farm Jerseys
Our Present Offering Affords an Unusual Opportunity to secure a Fine Foundation For a Productive Herd and comprises
A young bull, solid color, and ready for service. There is not a weak line in his pedigree. His sire carries 37½ per cent of the blood of Hood Farm Torono, the great sire of high producers; the sire's dam is an 11,000-lb cow; and on the bottom line of the bull's pedigree there is an unbroken line of Register of Merit cows for five generations. Five he fe rs dropped respectively Feb. 23, '17; Feb. 26th, '17; Apr. 5th, '17; Sept. 21st, '17; and Oct. 24th, 1917. All are sired by Lookout Prince, 115074, whose first daughters to freshen are now under test and are "making good". Three of the five are out of Register of Merit dams; and all five have R. of M. backing; are finely bred for production and are good individuals.
ADDRESS HENRY S. REDFIELD,
1925 Seventh Avenue, - New York City.

EFFICIENCY JERSEYS for the BUSINESS FARMER

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

Lakeside Herd

Best Bulls For the Money

State about amount to be invested, with quality required. I will describe the best for the amount. Large number of females to select from, all ages. Highest individuality, large production, best type, best udders are characteristics of Lakeside Herd. E. A. POWELL, Syracuse, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Susquehanna Farms, Hartwick Seminary, N. Y.

Hazelhurst Stock Farms

Offer a Yearling Son of King Segis Pontiac Canary who is a 30-lb. son of King Segis Pontiac. Youngster's dam is Hazelhurst Rouble Clothilde with 7-day record of 30.32 lbs. butter and 579.3 lbs. milk. His dam and sire's two dams average butter 7 days, 32.78 lbs. and for 30 days 126.54 lbs. He is nearly white, a fine individual and very straight. Priced for quick sale. Write.

H. H. Wickwire & Son, Hubbardsville, N. Y.

Grade up your common stock with a pure-bred

HOLSTEIN SIRE

It won't be long before you'll have a fine money-making herd.

Holstein Bulls impress their characteristics upon any blood with which they come in contact, and their calves are thrifty from the start.

You can't afford to use a scrub bull. A Pure-bred Holstein Sire is soon paid for by the improved milking capacity of his daughters and the increasing value of the herd is all clear profit.

GEO. E. STEVENSON & SONS, Clarks Summit, Pa

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go. **EDGEWATER STOCK FARM, Fort Atkinson, Wis.**

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Rock River Valley Farm

Do You Need a Young Bull?

Mutual Fobes Longfield DeKol, 82959

One of His Good Young Sons for Sale

Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters although a comparatively young sire. His sire is one of the good sons of Mooie Mutual DeKol. His dam, a daughter of Homestead Jr. DeKol (71 A. R. O. daughters), made 30.04 lbs. butter and 630.80 lbs. milk in 7 days as a Jr. 3-yr.-old. At the same age she made 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days.—(A world's record when made.)

The Dam Of This Young Bull is Monona Josephine with 31.77 lbs. butter and 616.2 lbs. milk in 7 days. She is a granddaughter of Homestead Hengerveld DeKol and Dutchland Sir Pontiac Rag Apple (29 A. R. O. daughters). The first of her daughters to be tested made 22.82 lbs. as a jr. 2-yr.-old in the month of June. Two of her sons are in service at the head of first class herds.

The Calf Himself was born March 11, '18. He's nearly half white and a good individual, one of the kind that will develop into a big, straight, rugged herd sire. Moreover, he's bred right. Notice the milk production on both sides of his pedigree.

We Have other young bulls for sale. Write today or come and see us.

MILFORD MEADOWS STOCK FARM, Lake Mills, Wis.

Admiral Inka DeKol 229668

Who Wants This One at $150

A son of Admiral Walker Prilly 72923 whose dam has four seven-day records between 30.47 and 32.50. His dam, Netherland Inka DeKol 2d 135687, at 3 years butter 7 days 19.92, milk 445.80; at 2 years of age she made 14.04 butter, 297.10 milk.

YOHN'S STOCK FARM, Watertown, Wis

FOR SALE—Registered Holsteins

Young Bulls—5 to 10 months old, 2 sired by Johanna King Segis, the 40-lb. bull; 1 by the show bull, Beauty Walker Pietertje King; 2 by our splendid senior herd sire, Czar Walker 2d. We also have 7 beautiful heifers 4 to 15 months old sired by King and Czar above mentioned. *Eight well bred cows,* safe in calf to Czar 2d, offered. Must sell because of shortage of feed. Breeders, not dealers.
Elm Leaf Stock Farm, Bear Creek, Waupaca County, Wis. Jas. McKone, Prop. Wm. Lucia, Manager.

YOUNG BULL FOR SALE

I am now offering an excellent young bull dropped February 27.

His Sire: A son of King Segis Pontiac Polkadot, that has 100% the same breeding as K. S. P. Alcartra, and from one of the good daughters of Korndyke Wayne Paul De Kol. **His Dam:** Rosa Queen Herbert De Kol, a 22.5 lb. junior, 4-year-old. This calf is well grown and a remarkably fine individual.

A few other bulls up to 11 months old, and several females for sale. Every animal guaranteed.
HALSEY SEDGWICK, Limeridge, Wis.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.
Highland View Place, - Whitewater, Wis.

Fairview Stock Farm Holsteins

For Sale: 3 yearling heifers sired by Sir Korndyke Hengerveld Grouw, whose dam is a full sister to Pietertje Maid Ormsby. Also one bull ready for heavy service. Write your wants. **FAIRVIEW STOCK FARM, W. G. Marshall, Prop., Whitewater, Wis.**

Holstein Bull Calves For Sale

Well bred, well marked, good pedigree; ages from one year down. Farmers' prices.
L. K. LUSE, SUPERIOR, WISCONSIN.

For Sale — Registered Holstein Heifers

2 years old due to freshen soon. Herd on the accredited list. **Alvin Noyes, R. 5, Jefferson, Wis.**

A Complete Dispersion

of the Avoca Lodge Farm Herd

120 Registered Holsteins to Be Sold

October 9th and 10th, 1918

8 Miles Southwest of Denver, Colo.

Korndyke Pietertje Colantha 96261.

Korndyke Pietertje Colantha, our senior herd sire, will be sold. He is the only son of Pontiac Korndyke having for his dam the only cow that ever produced a 30-lb. daughter at 24 months of age. She was the first cow that ever produced two 30-lb. heifers. He has 7 sisters with records from 37 to 47 lbs., and 10 A. R. O. daughters with records up to 24½ lbs. all made as 2 and 3-year-olds.

The only bull in the world backed by such a combination of breeding and production.

Orchard Grove Rag Apple, a son of Rag Apple Korndyke, is our Jr. herd sire.

In the Show Ring.—We showed the Grand Champion bull at the 1916 Colorado State Fair and the 1918 Western National. Our aged herd and get of sire groups were undefeated the past 2 seasons. We have won over twice as much prize money at the shows where we have exhibited the past 3 years than have any of our competitors.

We have fifteen daughters of Buffalo Dirkie Johanna, our $10,000 bull who was a son of "Johanna Colantha's Lad" and Oakhurst Duchess Clothilde, the dam of Duchess Skylark Ormsby.

We have cows that have milked 112 lbs. in a day, 22,000 lbs. in ten months and 43,000 lbs. in 21 months with butter records over 29 lbs. in seven days and 126 lbs. in 30 days, made under ordinary conditions in our dairy barn.

We have 50 granddaughters of Pontiac Korndyke and King of the Pontiacs. We have 30 cows and heifers that weigh from 1,600 to 2,000 lbs.

Catalogues will be ready on Sept. 15th. Write

Donley & Simpson, Props. P. O. Mt. Morrison, Colo.

Absolute Dispersal

Of Boardman Farms Herd

At Jackson, Michigan

Wednesday, Sept. 25, '18

of Registered Holsteins

One of the Oldest and Best Michigan Herds. No Old Worn Out Ones.

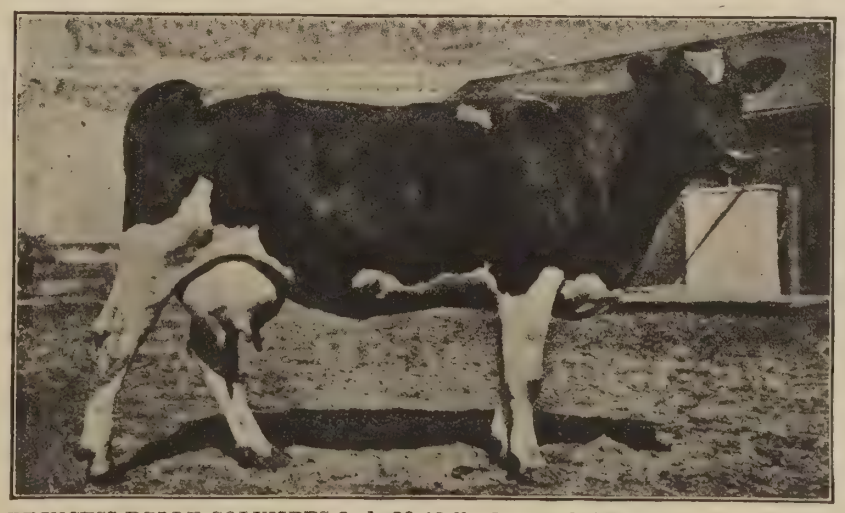
SIXTY HEAD OF FEMALES

in dairy working condition, headed by King Korndyke Oriskany Pontiac No. 143113, a four-year-old Grandson of Pontiac Lass 44.18 lbs. butter in 7 days. His dam has 31.33 lbs. in 7 days and she has 3 A. R. O. daughters. One of the best individuals in Michigan—all females bred to him—all sound, healthy, tuberculin tested. No reaction in years. Several good A. R. O. cows whose records can be increased. Son in France, owner in poor health.

Absolute Dispersion of a Breeder's Herd

The Entire Prairiedale Holstein Herd of 75 Head Will be Sold

at PRAIRIEDALE FARM, DIXON, ILL., OCTOBER 3, 1918



67 FEMALES—8 BULLS and BULL CALVES to be SOLD

Including 12 cows and heifers with records of from 23 to 29.48 lbs.—only 3 made at full age—and 32 daughters of these cows. In this group are 5 three-year-olds, with records of 23 to 27 lbs., a 29.48-lb. cow and a 28-lb. cow.

Four 20 to 22.46-lb. first calf 2-year-olds.

A 20-lb. 2-year-old daughter of Field's great herd sire, Dutchland Creamelle Korndyke Lad.

Seven cows and heifers, or stock from them, having averaged 624.4 lbs. milk in 7 days; 2 under full age.

PRINCESS BELLE COLUMBUS 2nd—29.48 lbs. butter, 629.10 lbs. milk in 7 days. 120.04 lbs. butter, 2715.9 lbs. milk in 30 days. She, 3 daughters and 1 Son will be sold.

MAPLECREST SIR DEKOL our herd sire, and 27 of his daughters will be sold.

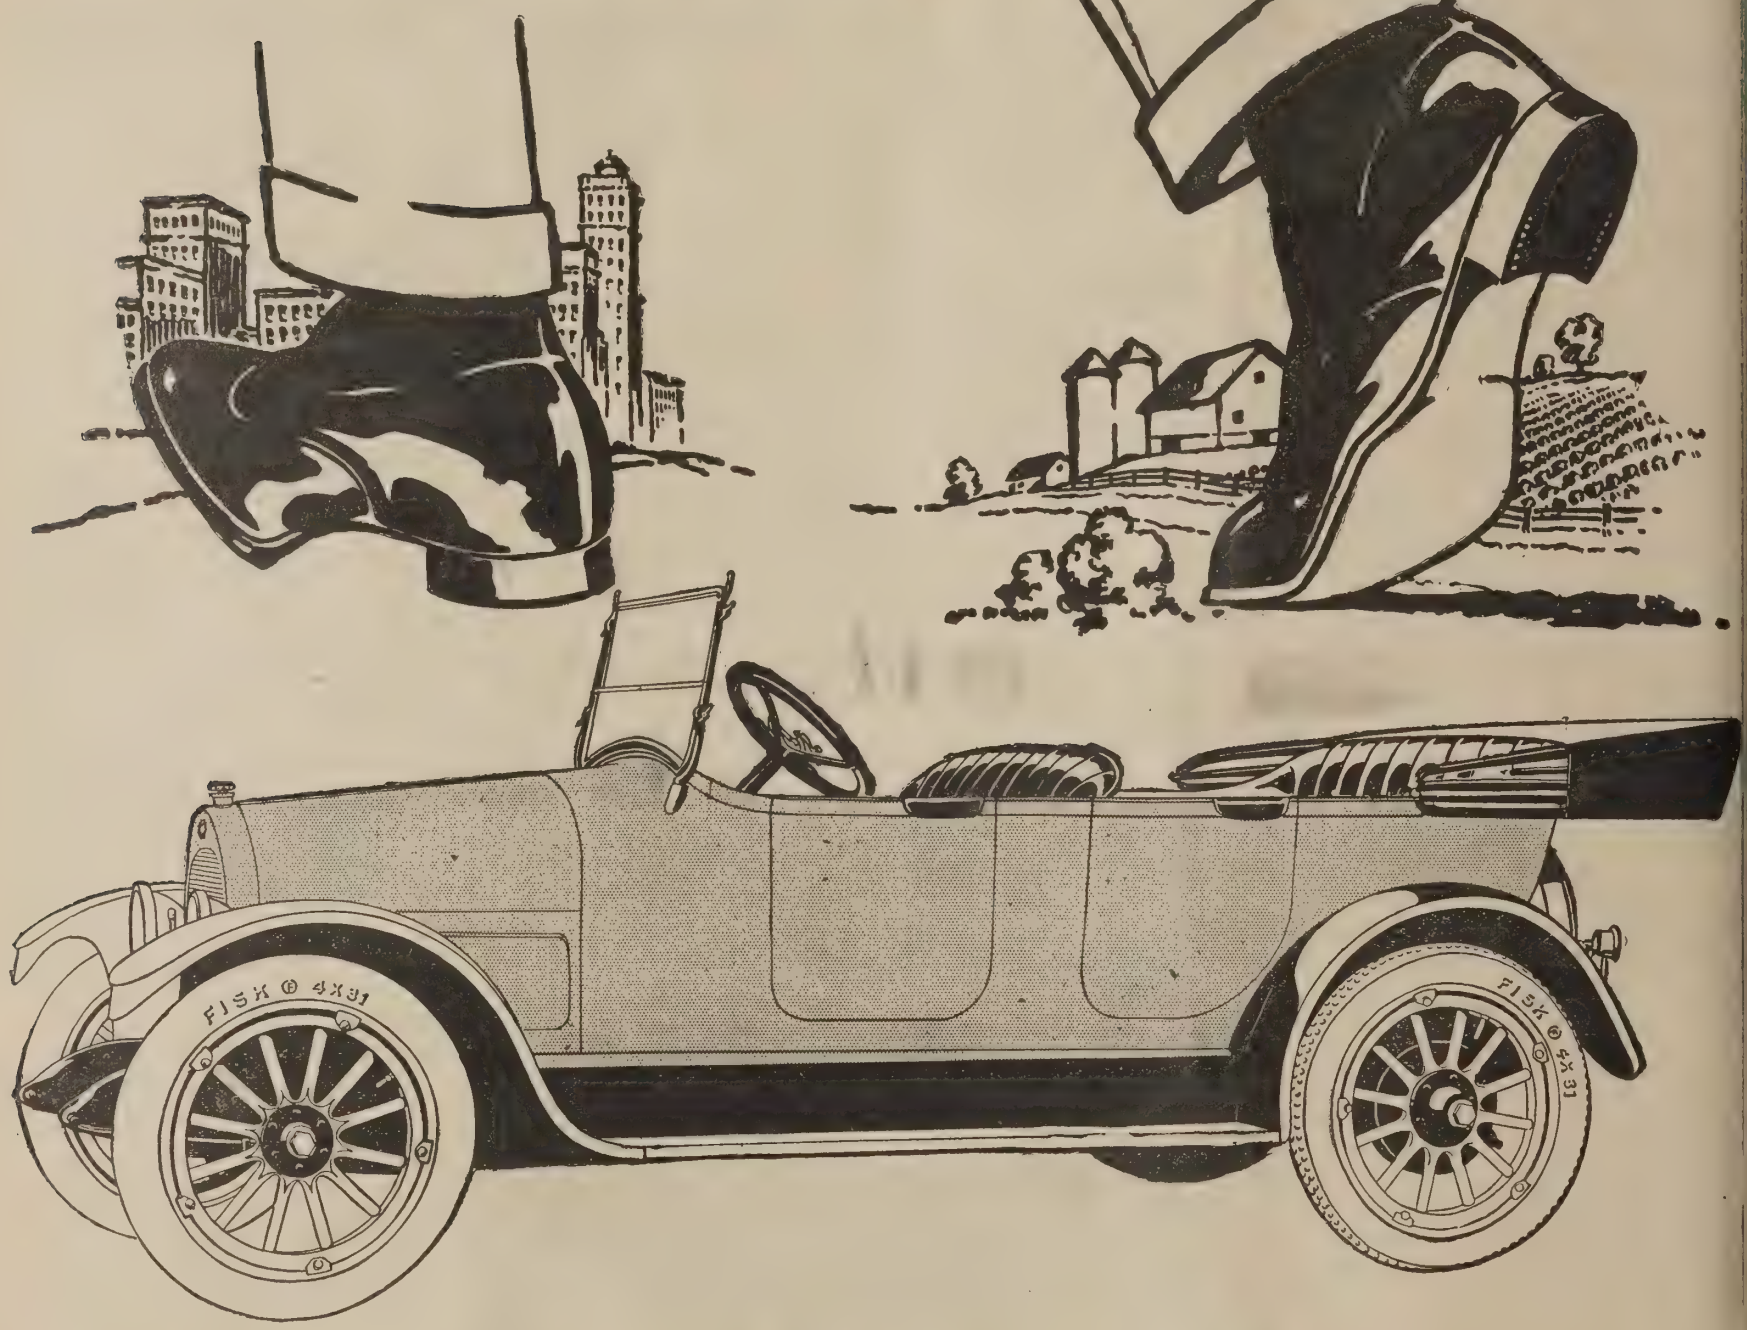
He is a 31-lb. son of Friend Hengerveld DeKol Butter Boy (37 A. R. O. daughters, 5 above 30 lbs.). His dam (herself a 31-lb.cow) is a daughter of Pontiac Aaggie Korndyke and from Daisy Grace DeKol, 32.50 lbs. butter in 7 days, 1203 lbs. in 1 year.

39 cows and heifers bred to this sire will be sold—12 of them with records of from 23 to 29.48 lbs.

Every cow and heifer of milking age has a creditable A.R.O. record. Every one of the young stock, with one exception, has an A. R. O. dam. Every animal in the sale, except one foundation cow and our herd sire, was born on Prairiedale Farm. The milk from every cow has been weighed twice daily the year around since 1903. During the past 4 years the herd has averaged 10,214 lbs. milk per cow per year.

This is an exceptional opportunity to buy not only excellent Holsteins, but family groups as well. 20 cows and 37 of their daughters will be sold. In several cases a cow, and 2, 3 or 4 daughters are included. All cattle over 6 months of age tuberculin tested and every animal guaranteed a breeder.

R. R. Station, either Sterling or Dixon. Prairiedale Farm is midway between the two places, which are connected by an electric road.



Haeger & Perry, Auctioneers, S. T. WOOD in the box.

Write today for your catalog to Galt & Spencer, PRAIRIEDALE FARM, Dixon, Ill.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Wisconsin Holstein Meeting and Sale

The Holstein-Friesian Breeders' Association of Wisconsin will hold a sale in connection with its next annual meeting. Both sale and meeting will be held in the new sales pavilion at Fond du Lac some time in March and F. H. Everson, Lake Mills, will be sales manager.

This was decided at a meeting of the board of directors held at Fond-du Lac Wednesday, September 4th, and attended by S. H. Bird, president; F. J. Bristol, A. P. Kaye, R. J. Schaexfer, H. F. Schroeder, F. H. Everson, J. P. Riordan, and Charles Hampke.

There was a general discussion as to the policy of holding the sale and annual meeting at the same time, the directors agreeing that such a combination would tend to bring out a larger attendance for both events. On the matter of dates there was a division of opinion but the larger number favored March. There was considerable sentiment for deciding upon a permanent place for holding the annual sales, but after some informal discussion it was decided to defer action on that question for another year. Fond du Lac was an easy winner for the next meeting and sale, by reason of the fact that the sales pavilion just being completed by the Holstein Breeders' Sale Company is steam heated and will furnish comfortable quarters for stock and attendants in the most severe weather.

The sale committee consists of S. H. Bird, F. J. Bristol, and H. F. Schroeder.

Wisconsin. E. M. JENISON.

Those who believe so earnestly that "money will do everything" are most apt to be willing to "do anything for money".—Max.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

In Haying Time

In hayin' time the fields are gold,
And what a sweet breath on the air!
Of course, 'tis summer, growing old,
But in her yellow dress she's fair.
And, Mister Jim, with pitchfork, throws
The treasured grain, that nature grows.

In hayin' time, the fields are rich;
Another winter's store is in.
And August—like a harvest witch,
Waves wand above th' feedin' bin.
Right soon, that silo over there,
Will groan beneath its wonted share.

In hayin' time, the youngsters race
To ride a-top that scented load!
And sloping hills are filled with grace,
As we roll down the shaded road.
The herd must know that it will reap
This harvest when June's flowers sleep.

The Way It Goes

"Hawkins turned his dairy farm into a sort of hospital for sick folks, and asked 'em a fancy figger to stay there."

"Was the scheme a success?"

"Nope. The pure milk, cream, and butter and outdoor life did 'em so much good, that they got well and left before he could cash in."

Observations of a Dairy Optimist

Germs get into milk mighty easy and propagate fast. But then, germs know what is good fer them."

Every time I see a fine cow, all covered with flies and no effort being made to ease her of them, I feel like tieing a wasp nest around the owner's neck.

Wonders Never Cease

It was the first time Rastus had ever seen a milking machine at work in the dairy. He watched, fascinated.

"Well, what do you think of it?" the farmer inquired.

"Sho is some trick, Mistah Henry," was the reply, "whut won't folks do nex'. Befo' dey quit dey'll have dem pipes runnin' straight frum de cow inter de city folks kitching."

Little Esther saw a calf weaner dangling from the calf's nose.

"Oh look, mother!" she cried, "it's wearin' ear-rings in its face!"

Confessions of a Dairy Maid

"Since the new order of things on the farm, there is no more romance connected with my job. Once upon a time I wore a sunbonnet and a gingham gown, and tucked a sprig of purple clover in my hair. Poets wrote about me and I was the heroine of books. Some rich man always saw me in the doorway of the dairy house and married me. Now, however, the milking and the cream separating and the churning and the cheesemaking is done by electricity, all I do is press a button and go to the movies."

"I feel this way about that 'Work or Fight' rule," remarked Old Uncle Culpepper of Dairy Grove, "that if it comes to selecting between trench work and weanin' a calf, I'll go to the front."

"I see they have started milk depots in fire stations, out New Haven, Conn., way," said Joshua Milkteat, of Cream Corners, "which is a good idea. But it sure would cause a rumpus if every time a housewife wanted milk, she'd turn in an alarm."

DE LAVAL SEPARATORS

SAVE IN 7 WAYS

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.

LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST since while a De Laval Cream Separator may cost a little more than a poor one to begin with, it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION which is no small consideration, and can only come from knowing you have the best separator, and being sure you are at all times accomplishing the best possible results.

Easy to prove these savings

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency write the nearest De Laval office, as below.

The De Laval Separator Co.

The Nebraska State Fair

W. V. DOBBINS, NEBRASKA

THE importance of the dairy industry in war-time in America was emphasized strongly at the Nebraska State Fair just closed. The state dairymen's association, the college of agriculture of the state university, and the buttermakers combined their forces in an attractive exhibit. Four Holstein and Jersey cows, top milk and butter producers, occupied quarters in the dairy building; a cottage cheese plant was kept running the greater part of the time; and lectures and bulletins by members of the university farm college staff were given. In the center of the building was a statue made entirely of butter typifying "The Spirit of 1918", which is food raising and food conservation. One figure represented corn, a second wheat, and a third a garden.

The cottage cheese factory was the center of interest, and great crowds surrounded it at all hours. This is part of the campaign of education to conserve meat by substituting for it articles equally rich in protein. Cottage cheese, the experts told their hearers, fills this need. Heretofore most of the skimmilk has been fed the calves and pigs. Its utilization in cheesemaking in Nebraska would produce muscle-building material equal to that in the bodies of 540,000 steers, said Professor Frandsen, head of the state farm dairy husbandry department.

The central fact sought to be driven home to the farmers who called was that they have been neglecting one of the richest sources of agricultural prosperity and one of the surest opportunities for profit making. Nebraska now possesses 720,000 dairy cows and its dairy products last year totalled between 60 and 70 million dollars. The cream business has grown into a large industry, between forty and fifty million pounds of butter being made in Nebraska in the last twelve months and distributed among consumers in twelve states.

Twenty-five million dollars, the value to the farmer of the cream sold, goes far to pay the running expenses of the farms while at the same time adding to its fertility and making possible a more intensive system of farming. The dairy turns out a finished product selling at a high price per pound and made from rough and cheap forage, corn, and alfalfa. Nebraska cows are producing an average of 150 pounds of butterfat per year, sold at from 40 to 50 cents a pound. Nebraska can easily double her butter production and turn into cash her surplus of cheap forage. These were the central facts about the industry driven home by the placards, bulletins, and lectures given.

The dairy cattle exhibit was not up to standard. The Nebraska portion was largely devoted to a showing of Lancaster county herds, which have witnessed a large development in the last year, while only two other states were represented.

The war note was struck in practically every exhibit on the grounds. Conservation of food, clothing, and shoes were taught in several camps advantageously located. Vegetable and fruit driers were in operation and contests were staged between teams in canning demonstrations. In the food conservation camp the dominant idea was how to provide palatable and proper substitutes for meats. In the clothing camp, demonstrations were given of the best methods of remaining well dressed by the use of made-over gowns and suits. In the shoe conservation camp, experts were constantly showing how many parts of shoes that have been thrown away in the past might be used and a good appearance preserved.

The tractor exhibit was many times larger than at the last fair. There were acres of tractors and farm motor trucks. These were centers of interest for thousands of farmers. The manufacturers have been remarkably successful in developing the small general purpose tractor, and were offering many varieties of farm trucks, the use of which is now admittedly economical in the grain growing sections.

COTTAGE CHEESE BOOTH AT THE NEBRASKA STATE FAIR

This booth was in charge of Professor Krause of the United States Dairy Division and Professor Luithly of the University of Nebraska. The booth was visited by a large number of people, and samples of the cheese were distributed. Here was conducted a campaign of education to induce Nebraska people to use cottage cheese freely as a substitute for meat.

"THE SPIRIT OF '18" REPRESENTING FOOD CONSERVATION AND FOOD PRODUCTION

The statue, shown at the Nebraska State Fair, was made entirely of creamery butter. The figures used in the "Spirit of '76" are here reproduced, but the art of peace is substituted for that of war.

A great new hog barn of concrete erected during the last few months housed the largest and finest collection of swine Nebraska has ever seen. The largest of the lot, weight 975 pounds, was raised in Gage County and is three years old. Nebraska has been growing in importance as a hog breeding state, but it required this big new building to fully demonstrate the magnitude of the industry.

The drouth that had first destroyed most of the wheat crop and then taken the greater part of the corn crop in eastern and central Nebraska was expected to make of the fair more of a live stock show, but the counties in western and southwestern Nebraska, where the rainfall has been plentiful, sent in large exhibits and brought the grain part of the big show up to the standard. In many of these counties the cash value of the crops raised exceeded the prevailing market price for land a year ago. Grains and grasses, potatoes, beets, and melons were there in abundance from the northwestern section, while the exhibits from the southwest rivalled the best that the older settled sections had been able to show in past years.

The fair, outside of the machinery and farm implement sections, was really a big food show. From the hog barn on the west to the horticultural and agricultural building on the east, exhibits were very largely devoted to food exhibits and conservation.

The attendance at the fair was practically the same as last year, in spite of the war and the rain and threatening weather of the first two days. The 1917 total was 200,763, while that of 1918 was 214,537. Wednesday is usually the big day in the matter of attendance, but rain on Tuesday cut this down materially, although 53,000 passed through the gates. Thursday broke all attendance day records with 65,562.

Lyon's New York Dairy Notes

HOARD'S DAIRYMAN:—We are just passing the picnic season and have fairly entered the fair season. Neither of these are as well attended, as a rule, as they once were. This is because of the large amount of work on the farm not yet completed to its usual date. Another thing that seems noticeable, and that is the rather worn condition of farmers and the women folks. I do not believe this is imaginary. I fear that farm folks are overdoing on the work schedule. It is doubtful if this is entirely excusable. We must all work about to the limit, but not to the danger point as to health.

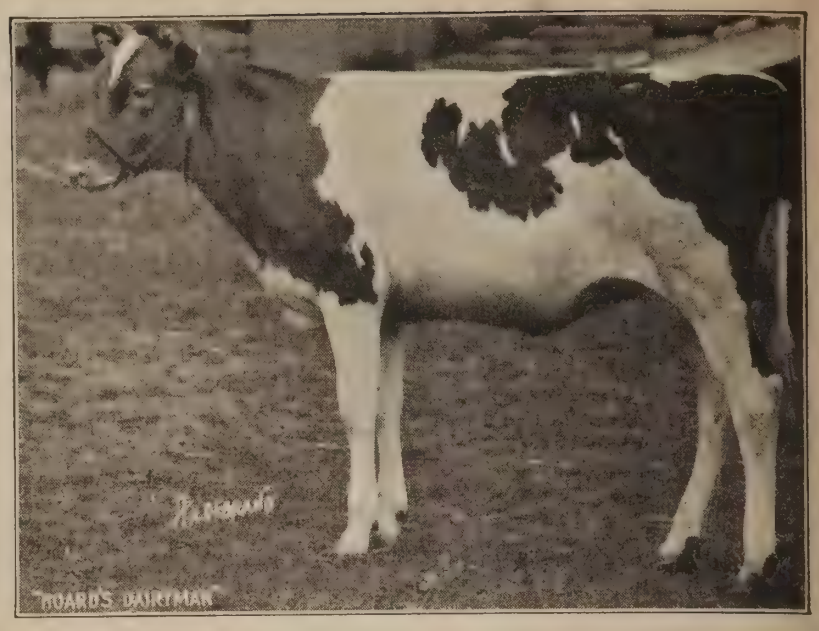
At one of the picnics lately I heard an address by Prof. Du Bois, the director of the agricultural school at Delhi. His discussions were general in character, but being in the dairy section he took a look at the dairy situation. He finds that we have passed the danger point in dairy disintegration, something that was so apparent a year ago and well along into this year. Indeed on the first of July there seemed to be considerable doubt if all concerns would continue to buy milk as of old. There is less storage of butter than last year by some 13 per cent. Cheese storage was represented by over 92 last year, while now it is only 30, less than a third of the cheese in storage of a year ago. Condensed milk is stored in much less supply than last year. It is supposed, although not stated, that the supply of milk is rather under that of a year ago. It looks as though by spring, or before, that the dealers and consumers may be asking for milk. It is to be hoped that we can supply what is required, for we need to do all possible to cultivate a demand for milk. Some say that consumers and dealers ought to be compelled to go without, because they have rejected milk when it was offered them. There may be some argument in this but not sound argument. If people do not use milk freely they will learn to use something else. That will do us harm and at the same time it will be detrimental to their health. We want neither.

It is still apparent that we do not get the price we should have for the milk we sell. Prof. Du Bois quoted figures to show that from 1910 to 1914 feeds advanced in price fifty per cent while milk advanced only thirty-five per cent. During the last four years both have advanced a hundred per cent, but it will be seen that with the fifteen per cent less advance during the former four years we are still considerably off yet in milk prices as compared with feeds. Labor too has advanced and all costs of production are well up, and it would seem that there is justice in further advances in the price of milk. Possibly we may see some of this advance before spring, but of this we cannot definitely say now.

There is much responsibility on the Dairymen's League just now. Indeed there is a good bit of responsibility there all along the line. There is need of the wisest counsels in the management now. The League seems to have a pretty clear field for operations this fall and winter. Can they match the situation? It is this month that they set a price and presumably it may be for the winter. Conditions may demand that they fix a price for

(Continued on page 293)

The Wisconsin State Fair



"WHEAT production doubled in 1918 over the pre-war period." Such is Wisconsin's reply to the nation's cry for more wheat. She has not for years considered wheat an important crop, but this year she has produced enough to supply over three bushels for every man, woman, and child within her borders. This, together with her other cereals, makes her more than self sustaining. Remembering, also, her responsibility as the premier dairy state, she has doubled her condensed milk production and though she has produced for several years over half the nation's cheese, this year she will increase her allotment by nearly twenty per cent. Being mindful of the sweet-tooth of her own countrymen and of the call for sugar, she has jumped her sugar beet production 75 per cent and will this year supply seventy million pounds of sugar, saying nothing of the increased production of sorghum, "the long sweeting" of our fathers.

A kind Providence has smiled on Wisconsin farms this year, but to it cannot be ascribed the whole achievement. At her state fair, held in Milwaukee Sept. 9 to 14, it was clearly shown by the quality of her exhibits and by other evidence that her farmers are making decided progress in developing more productive seed and in adopting improved methods of farm management. In addition, with the ideal of patriotic service as their inspiration and with less available labor, they have put their shoulders resolutely to the task before them and with patience and perseverance have worked from early dawn to late twilight that larger crops might be planted, cared for, and harvested.

Perhaps Wisconsin was somewhat boastful as to her accomplishments, but o'er-weening modesty is never a part of a state fair or competition. It is in the air and is infectious, so banners were shown detailing the progress and importance of Wisconsin. She claims first place in cows, butter, cheese, condensed milk, and silos. Exhibits showing that quality accompanies quantity were much in evidence. The cattle barns were filled with dairy cows of splendid capacity, the dairy building showed large exhibits of butter and cheese that impartial judges scored high, while the interest manifest in the many displays of silos and silo filling machinery was proof that farmers were convinced of the economy of the silo in live stock production.

The dairy cow will probably never yield first place in his affections, but going with her the Wisconsin farmer now claims first place as a grower of pure-bred grain and certified seed potatoes. The keen competition between counties brought out grains and fodders that give good foundation for a proper state pride. There were, of course, the large pumpkins and squash, renowned of legends of fairs from time immemorial. There were vegetables in quantity and quality that indicated the home gardener, the school garden, the truck man, and the farmer had not neglected these things. But interest was keenest in the quality and yields of grain, hay, and potatoes. As a ten-year average, the state claims leadership in yields per acre (without irrigation) for oats, barley, spring wheat, and flax; third in corn; and tied with California on sugar beets.

When harvests are fully completed Wisconsin will have grown 65 million bushels of corn, 8 million bushels of wheat, 94 million bushels of oats, 23 million bushels of barley, 7½ million bushels of rye, 32½ million bushels of potatoes, ½ million bushels of buckwheat; 70 million pounds sugar. Much of this is ascribed to the better quality of seed now available through the work of the state association of pure-bred seed raisers.

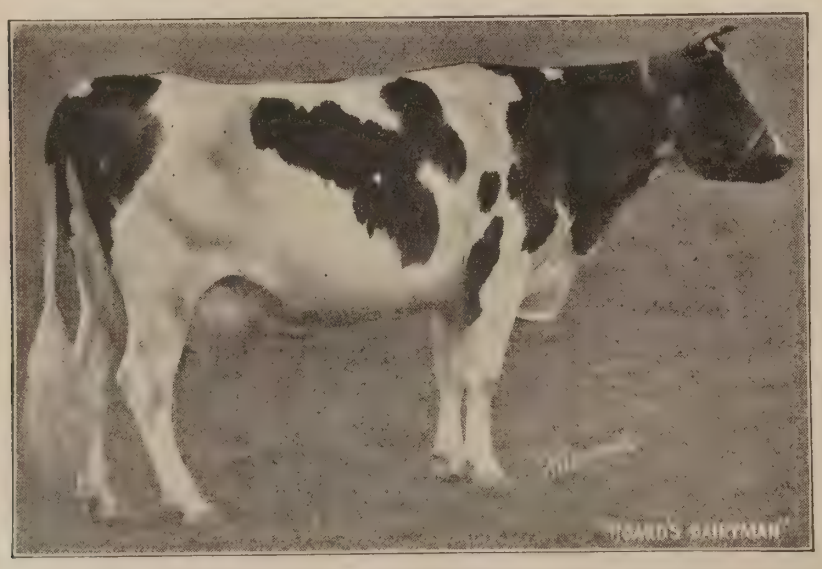
OWNED BY FRUIT BROS., WISCONSIN

NOCKDAIR KING SUPERBA GLADICE, JUNIOR AND GRAND CHAMPION HOLSTEIN BULL AT THE WISCONSIN STATE FAIR
OWNED BY BAIRD BROS., WISCONSIN

It will surprise many to learn that Wisconsin has attained first place as a hemp growing state. It was only a few years ago that hemp was tried near Waupun as a smother crop, for which it proved its worth. The exhibit at the fair this year showed that it was also a profitable crop that yields gross returns of $75 to $100 per acre. There were shown various articles made from hemp, the latest of these being hemp binding twine that may eventually render the American farmer independent of the sisal trust and its exploitation. Improved machinery to reduce the labor cost of this crop is being developed and it now is felt that another profitable crop is available.

The award for the best county exhibit went again this year to St. Croix County. The contest was close and this county is deserving of full credit for winning the cup two years in succession. County Agent Olson proudly claims, "We raised the roof and grew the sign". The roof of the county booth was made of ears of seed corn strung on twine, while the sign, a crescent bearing the name of the county, was made with grains of various cereals. In discussing the awards, Superintendent Luther said Wisconsin was not only growing larger and better crops, but she was growing with them a mightier and better informed citizenship. Waupaca County was awarded second place and Sauk County third, with 26 counties competing.



The horticultural building was very attractively arranged. The center aisle was tastefully built up with flowers and plants in such manner as to make an inviting walk, yet the effect was to increase the importance of the fruit display. That good fruit is in demand was shown by the eagerness with which visitors purchased Wisconsin grown apples even after passing by the loud-mouthed vendors of peanuts, popcorn, and ice cold drinks, to say nothing of the savory (?) smelling "hot dogs". Commercial fruit and apple growing is on the increase and every year it becomes a more important phase of the state's agriculture.

There was a creditable show of swine, with red, white, black, and spotted hogs that would please the eye and pocketbook of any farmer. Sheep, poultry, and horses were well represented, but Old Dobbin did not draw the attention or achieve his old time prominence of the era before the smell of gas. There are still men who like good horses, and it is a mistake to even intimate that well bred horses are not being grown or shown, for they are.

Farm machinery, tractors, automobiles, and all the various farm supplies were there in their usual number and were of vital interest to many. That the farmer is interested in improved machinery is an old story, but we were doubly impressed when told by an exhibitor of a water power plant that sells for approximately $500, that he sold three outfits in one day and had good prospects of several other sales. The farm home is coming into its own, and better living is promised farm folks as the years roll on.

War and resolute preparation for its successful consummation was everywhere in evidence. Soldiers, sailors, Red Cross nurses, and boy scouts were welcomed at every turn. The United States and British government's war exhibits made the Wisconsin fair as they have the other state fairs. That a better understanding of the meaning of the war will result seemed apparent as one watched the expression on the faces of those passing down the aisles. Straining eyes and compressed lips gave mute testimony of the thoughts of those who had just read the morning reports of the splendid achievement of the American army in cleaning up the St. Mihiel salient that has been a threatening point held by the Germans continuously since 1914. These men and women felt something greater and deeper than mere curiosity. The boys were "over there", and these were the things they would see and bear. If these people needed strengthening, their arm is now more firmly raised to strike the heavy blows and to suffer much that such victory shall be won as will bring an enduring peace.

The state fair of this year has seldom or ever been equaled in the quality and finish of its manifold exhibits. Commissioner Norgord, Secr

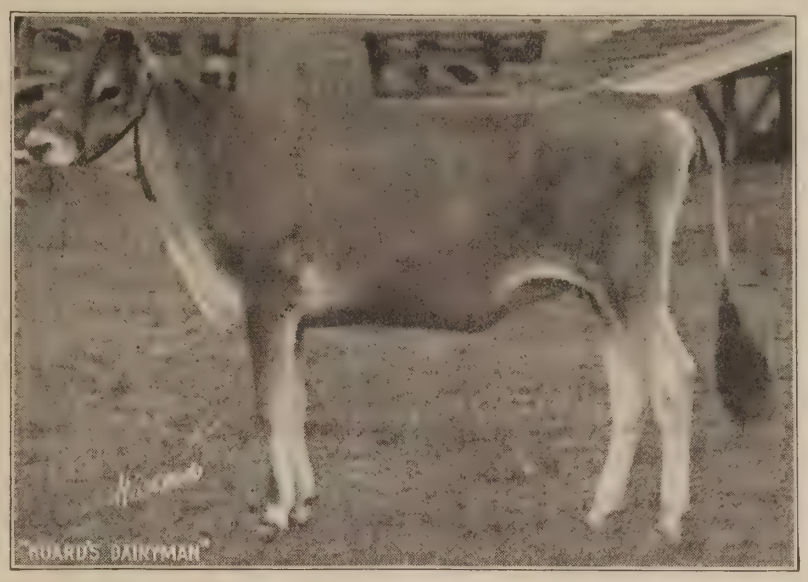
OWNED BY MEADOW LANE FARM, WISCONSIN

tary Remey, and their co-workers are to be commended for their accomplishment; the fair was a credit to them. The weather was such as to discourage attendance, yet Thursday brought a record crowd. Seventy-five thousand people crowded the exhibit halls to suffocation, filled the grandstands, overran the sidewalks till the streets were just a mass of moving people. If more had come, the grounds could scarcely have accommodated them.

Dairy Cattle Exhibit

The showing of dairy cattle at Milwaukee this year was very much superior to that of last and was, in fact, fully equal to any that has been seen there for the last several years. As at a number of the earlier fairs, the Guernseys outnumbered any of the other breeds and taken as a whole they were of a little better quality than the others.



An innovation at this fair was the cattle exhibit made by Waukesha and Calumet Counties, Wisconsin. The former has long been known for the number and quality of her dairy cattle and her exhibit was all that might have been expected from such a community. Forty-two Guernseys, and about 30 Holsteins, and several Ayrshires were shown as representatives of Waukesha County cattle,—these in addition to a Holstein herd, a Guernsey herd, two complete Ayrshire herds, and one herd of Jerseys. The lists of awards that follow show plainly that the county has every reason to be proud of the representatives of their herds that were shown. This practice is an excellent one and will we hope be continued at future fairs, not only by the two counties that showed this year, but by others as well.

Guernseys

Exhibitors: Island Farm, Minnesota; Mountain Bros., Iowa; Goodhand Kingston & Son, Lewis McGrath, Arthur H. Peterson, Clovernook Farm, L. E. Gordon, Jr., C. J. Peik, Rundell Bros., and Waukesha County, including animals from the herds of Geo. McKerrow & Sons Co., F. E. Fox, Fruit Bros., Roy Burton, Geo. Lawson, J. M. Harvey, Wm. M. Jones, L. J. Wendt, G. W. Brown, J. R. Love & Son, John H. Williams, Geo. S. Love, H. Gaubatz, E. Hass, John Balen, C. J. Kuhtz & Son, and H. J. Ducken, all of Wisconsin.

Judge: Professor H. H. Kildee, Iowa.

As stated previously the Guernseys made the best showing both in numbers and quality. A majority of the classes were not only fairly well filled, but there was stiff competition in nearly all of them. Nine aged bulls were shown, most of them for the first time this year. Among them was Clara's Sequel owned by Rundell Bros. and well known in Guernsey circles because of the A. R. performance of his daughters. He is an excellent dairy bull, better in many respects than most of the others in the class. However, he lacked somewhat in style and finish and had to take second place, beaten by John Balen's Bonny Boy of Riverdale.

EAGLE'S CHRISTINA, JUNIOR AND GRAND CHAMPION JERSEY COW AT WISCONSIN STATE FAIR
OWNED BY J. K. DERING, ILLINOIS

Mountain Bros.' Imp. Kitchener's Express was an easy winner among the two-year-olds as he has been at earlier fairs. He is an outstanding bull of unusually good dairy type, with plenty of style and was, moreover, shown in the best of condition. He was senior champion and later defeated McKerrow's Chene King, owned by Wm. M. Jones and Geo. McKerrow & Sons Co., for final honors. The latter, a senior yearling, is an excellent young bull but he lacks the style and finish of his older competitor.

Among the females, the aged cows put up an excellent showing with 9 good entries. Imp. Bella du Grand Fort, Island Farm's entry, undefeated this season, maintained her record, winning in her class and both senior and grand championship. It was not an easy victory, however. Sonack of Hillstead, F. E. Fox's entry, a wonderfully good typed cow, pushed her hard for first place and had she been just a little better veined and carried a trifle more style, might have been the winner. The imported cow came into prominence again in the produce of cow class when her twin daughters carried off the blue.

Junior championship went to Mary of Maple Hill, Fruit Bros.' senior calf. Although the youngest in her class of 20, the calf was an outstanding individual of the very best type and an easy winner.

The awards follow:

Bull 3 years or over—1, Balen on Bonny Boy of Riverdale; 2, Rundell Bros. on Clara's Sequel; 3, Island Farm on Gold Lassie's Julian; 4, Mountain Bros. on Cherub's Winner; 5, Kuhtz on Dairy Maid's Criterion of Iowa; 6, Ducken on Parks Prince of Sima. Bull 2 years and under 3—1, Mountain on Imp. Kitchener's Express; 2, Kingston on Hopeful of Edgemoor; 3, McGrath; 4, Hass on Frank of Aurelian Farms; 5, Gordon on Craigamoor Golden Noble. Senior yearling bull—1 and 2, Jones & McKerrow on McKerrow's Chene King and Ultra King of Edgemoor; 3, Island Farm on Maxim of Linda Vista. Junior yearling bull—1, Mountain Bros. on

For Health and Economy Drink Milk—Eat Milk—Think Milk

DRINK MILK! Drink lots of it. Give it to the kiddies morning, noon, and night—and in between. Give them all they want. It's good for them. It's the cheapest and best food they can have.

Milk is indispensable to their physical growth and mental development. It builds bone. It builds tissues. It builds healthy minds.

It's the only food that contains enough of the protective elements that will keep them from degenerating into puny, rickety, little shavers.

Feed up a child in the way it should grow. Give plenty of good, wholesome pasteurized milk to the child, and use lots of it in cooking.

Dr. McCollum, of Johns Hopkins University, and other eminent scientists tell us so. Dr. McCollum spent over ten years at the Wisconsin Experiment Station investigating the diets of little animals whose digestive apparatus is practically the same as that of human beings. He fed these little animals a balanced ration of proteins, starch, sugar, and salt. Tallow, olive oil, cottonseed oil, and peanut oil constituted the fats of these rations.

For the first three months these little animals seemed to get along all right. But soon they lost appetite. They fell off in growth. They fell on the road to starvation.

And then Dr. McCollum fed the animals butterfat in place of the former fats in their ration. And immediately the little animals began to grow and thrive. It was evident that butterfat contained some elements necessary for growth that the other fats could not supply. These elements are the protective elements.

Dr. McCollum made other experiments. He took two little animals. He put them on the same diet, except that he fed the first as its 5 per cent fat ration, butter; and the second he fed oleomargarine.

At the end of the experiment, the butter-fed animal weighed 262 grams, and was bright-eyed and vigorous. The oleo-fed animal, on the other hand, weighed only 109 grams, and was puny, sluggish in movement, and had sore and infected eyes.

The butter substitute, though having almost the same energy and heat content as butter, lacked the growth-promoting, the protective elements.

Your children need milk, and butter, and cheese, and ice cream. Build your child's diet around milk. Give the child and yourself, too, a cheese sandwich instead of beef. Instead of expensive, non-nutritive luxuries, such as pies, eat ice cream. It's a good food, and easy to digest.

Drink milk—eat milk. It's the perfect food. And it's the cheapest food. It's nature's food.

One quart of milk is equal in food value to eight eggs, or three-quarters pound of steak. Eight eggs at present cost 28 cents. A quart of milk therefore would be a cheaper food at 25 cents. A quart of milk contains as much food as three-fourths pound of steak which would cost you 24 cents. A quart of milk that equals it in food value is worth therefore at least as much. You use gas and grease and spend some time in preparing steak for your meal. That costs you something. That makes the finished steak cost at least 28 cents, doesn't it?

But a quart of milk ***does not*** cost 25 or 28 cents. It costs a good deal less than that.

Health, vigor, enjoyment, and comeliness, all register in this pretty picture of a milk-fed child.

The United States Food Administration says:—"A quart of milk a day for every child, if possible, a pint without fail; a third of a quart for each adult."

Think it over!

It is necessary always to remember that the health and development of a nation depends upon the proper nourishment of its young, and that milk is not alone the best, but the cheapest among all animal foods.

Ayrshires

Exhibitors: Adam Seitz, Hazelwood—Ferndell Farms, and Chas. C. Hill & Son, all of Wisconsin.

Judge: Professor H. H. Kildee, Iowa.

The Ayrshires did not make a particularly interesting show this year. Adam Seitz's entries were excellent as usual but the only real competition there was in most of the classes was between animals from this one herd. The cattle of both the other exhibitors were good animals, but neither owner was an experienced showman and the cattle, with one or two exceptions, were not in show shape.

All of the Ayrshires were from Waukesha County.

The final awards were as follows:

Bull 3 years or over—1, Seitz on Cavalier's Lord Roseberry; 2, Hazelwood—Ferndell on Cavalier Fond Hope of Spring City. Bull 2 years and under 3—1, Seitz on Cavalier's Lord Stuart. Senior yearling bull—1, Seitz; 2, Hazelwood—Ferndell on Just Right. Junior yearling bull—1, Seitz on Cavalier's Goldfinder. Senior bull calf—1, Seitz; 2, Simmons on Cavalier's Oliver of Pewaukee; 3, Hazelwood—Ferndell on Victor Fizzaway. Junior bull calf—1, Seitz on Cavalier's Rising Star; 2, Hazelwood—Ferndell on Lotis Bud.

Cow 4 years or over—1 and 2, Seitz on Bargenoch Silver Pet and Willowmoor White Lola; 3, Simmons on Silver Beauty of Bull Ruck Farm; 4, Hazelwood—Ferndell on Buttercup of Maple Shade. Cow 3 years and under 4—1, Seitz on Cavalier's Lady Mary Stuart; 2, Hazelwood—Ferndell on Ferndell's Felicity. Heifer 2 years, under 3—1 and 2, Seitz on Cavalier's Kilnford Dorothy and Cavalier's Lady Beautiful; 3, Simmons on Flosie of Pewaukee; 4, Hazelwood—Ferndell on Broomhill Pender's Pride. Senior heifer yearling—1 and 2, Seitz on Cavalier's Kilnford Bell 3rd and Cavalier's White Lady; 3, Hazelwood—Ferndell on Broomhill Pender's Brown Kate. Junior heifer yearling—1, 2, and 3, Seitz on Cavalier's Kilnford, Lady Beautiful, and Silver Dream; 4 and 5, Hazelwood—Ferndell on Lassie and Pender's Pride of Hazelwood. Senior heifer calf—1, 2, 3, Seitz on Buntie Bell, Silver Queen, and Cavalier's Hillhouse Rosebul; 4 and 5, Hazelwood—Ferndell on Felicity 2d and Silver Pet. Junior heifer calf—1, 2, and 4, Seitz on Cavalier's Silver Actress, Cavalier's Lillian Walker, and Cavalier's Lady Betty; 3, Hazelwood—Ferndell on Cavalier's Dahlia.

Jerseys

Exhibitors: J. K. Dering, Illinois; W. H. Clark, Wm. N. Knight, and F. D. Underwood, all of Wisconsin.

Judge: Wm. Howie, Wisconsin.

The Jersey entries this year were not up to previous years in point of numbers, nor were they of quite as good quality throughout. Fifty-four animals from four different herds were shown.

The bull classes were not large, neither were they very good in most cases. With but two entries in the aged bull classes, Trial's Noble of Oakland, Knight's entry, was unquestionably better than Clark's Keepsake's Golden Lad 3rd. The latter was a strong, rugged bull of the type popular with many dairymen, but was a little too coarse to win out. Knight's entry was an easy senior and grand champion.

J. K. Dering took junior championship on Rosie's Big Chief.

The female classes generally were very much better, the aged cows proving particularly good. Judge Howie took plenty of time to these, but finally decided in favor of Fenwick's Eminence, a very typy cow from Knight's herd. She was not showing in the best of condition, having recently freshened. Her udder had begun to break away slightly, and in competition for senior championship there were those who would have favored the winning 3-year-old, Stinson's Adoration, from the same herd. The judge, however, decided for the old cow.

Eagle's Christina, the winning junior yearling owned by Dering, was junior and grand champion. We believe that this decision could, to say the least, have been equally well reversed, because the heifer, while possessing quality and very fair style, was plain over the rump and decidedly lacking in capacity and heart.

The class of 4 cows in milk all to be owned by the exhibitor made the best showing of the entire Jersey exhibit, the entries of Knight and Underwood standing out particularly well. The animals in both entries were of very good type, and practically all of them showed in heavy milking form. Mr. Knight's cows, while not so well fitted, had plenty of scale without any coarseness, and showed a little better type throughout. The Underwood group was, however, a close second.

A. J. Glover and Professor Kildee placed the ribbons in this class, Mr. Howie having bred some of the entries.

The awards follow:

Bull 2 years or over—1, Knight on Trial's Noble of Oakland; 2, Clark on Keepsake's Golden Lad. Senior yearling bull—1, Dering on Rosie's Big Chief. Junior yearling bull—1, Clark on Lady La Jones' Lassie. Senior bull calf—1, 2, and 4, Clark on Merissa D's Jolly Boy, Lad's Cream Boy, and Miss Narcise's 5th Lad; 3, Knight. Junior bull calf—1, Clark on Lad's Perfection; 2, Dering on Cedar Crest's Jolly Tar; 3, Bealhen.

Cow 4 years or over—1 and 5, Knight on Fenwick's Eminence and Fenwick's Rosinette; 2 and 4, Dering on Fairy Boy's Eulinda and Yolanda's Fairy; 3 and 6, Clark on Lad's Lady La Zone and Madame La Bute. Cow 3 years and under 4—1, Knight on Stinson's Adoration; 2, Dering on Fairy Boy's Violette; 3, Clark on Cream of Meadow Creek. Heifer 2 years, under 3—1, Dering on Eagle Chief's Fairy; 2, Clark on Eileen La Zone; 3, Knight on Eminent's Safety Bell 2d. Senior yearling heifer—1, Dering on Eagle's Chief's Eulinda; 2, and 3, Clark on Diamond Queen and Lad's La Bute. Junior yearling heifer—1 and 2, Dering on Eagle's Christina and Eagle's Yolanda Girl; 3, 4, and 5, Knight on Fanny's Bonnie Fox 2d, May of Oak Grove 2d, and Trials of Pretty Maid. Senior heifer calf—1 and 2, Dering on Blue Bell of Cedar Crest and Eulinda of Cedar Crest; 3, Knight; 4, L. P. O'Keefe; 5, Clark on Lad's Favorite Sunbeam. Junior heifer calf—1, 2, and 5, Dering on Fairy Boy's Crown, Cedar Crest's Fairy Queen, and Venner's Fairy Maid; 3 and 4, Knight.

Aged Herd—1, Knight; 2, Clark. Young Herd—1, Dering; 2, Clark; 3, Knight. Calf Herd—1, Dering; 2, Underwood; 3, Clark. Get of Sire—1, Dering; 2, Knight; 3, Clark. Produce of Cow—1, Dering; 2, Knight; 3, Clark.

Senior and Grand Champion Bull—Trial's Noble of Oakland. Junior Champion Bull—Rosie's Big Chief.

Junior and Grand Champion Cow—Eagle's Christina. Senior Champion Cow—Fenwick's Eminence.

TRIAL'S NOBLE OF OAKLAND, SENIOR AND GRAND CHAMPION JERSEY BULL AT THE WISCONSIN STATE FAIR
OWNED BY WM. N. KNIGHT, WISCONSIN

Holsteins

Exhibitors: A. F. Wendlandt, Minnesota; Jno. L. Fisher, Rust Bros., Emil Titel, Walter Seefeld, S. S. Stack, J. F. Kloehn, E. S. Weeks, and Waukesha County, including animals from the herds of Baird Bros., Meadow Lane Farm, D. J. Howell, Carnation Stock Farm, W. J. Mann & Sons, Frank Ludwig, Wisconsin Masonic Home, A. B. Klussendorf, and C. V. Chapman, all of Wisconsin.

Judge: Professor H. H. Kildee, Iowa.

While less numerous than the Guernsey, the black and whites were well represented at Milwaukee this year and, aside from the older bull classes, their showing was very good.

Downing Pontiac Butterman Jr., owned by C. V. Chapman, won first among a ring of very ordinary aged bulls and later was made senior champion. The only really good aged bull shown was Ollie Johanna Sir Fayne, a son of that wonderful cow, Ollie Watson Prima Donna. This is a sire of excellent type but very bad hocks brought him down to fourth place.

The senior champion was not a good mover, was over fitted, and had a very plain tail setting, making grand championship honors easy for Nockdair King Superba Gladice, Baird Bros.' senior calf entry. The calf was an excellent individual, growthy and well fitted,—a winner over thirteen in its class.

The aged cow class brought out 15 entries with 3 outstanding ones to compete for first place, all of them A. R. O. cows. Vickery Vale Beechwood owned by Emil Titel is a wonderfully strong dairy cow, particularly when one considers that she is 11 years old. She was, however, a bit plain and dropped too much back of the shoulder to get her above third place. Jennie Segis DeKol Burke from Baird Bros.' herd, a cow that recently made 24.62 lbs. fat in 7 days, would ordinarily have been first. She was not, however, in the best of condition and had some inflammation in her udder so that Professor Kildee placed her below Cande DeKol Westview, an excellent dairy type cow in every way, whose most serious fault was her lack of scale. This last cow, owned by Meadow Lane Farm, was later senior and grand champion.

Farsee Superba Queen owned by Mann & Sons was junior champion.

An interesting fact regarding the final awards is that 9 of the winners in the calf classes, including two junior champions and one grand champion, were sired by King Superba, owned by Baird Bros., Mann, and Roberts. His get also took first and second in the get of sire class.

Complete awards follow:

Bull 3 years or over—1, Chapman on Downing Pontiac Butterman Jr.; 2, Seefeld on Rzcine Walker Johanna; 3, Wendlandt on Joe Oak DeKol Fobes; 4, Wisconsin Masonic Home on Ollie Johanna Sir Fayne; 5, Rust on Daisy Johanna. Bull 2 years and under 3—1, Fisher on King Segis Pontiac Isaac. Senior yearling bull—1, Rust on Ida Lotta Hengerveld Pontiac. Junior yearling bull—1, Titel on Sir Longfield Red; 2, Hardys on Bairdland Sir Creamelle Segis; 3, Fisher on Fisher Fan of Rock. Senior bull calf—1 and 2, Baird on Nockdair King Superba Gladice and Nockdair Beets Segis Chimes; 3 and 6, Mann on Farsee Superba Netherlands Pontiac and Farsee Superba Roxy; 4, Rust on Fruitland Aaltie Solo King; 5, Klussendorf on King Easle. Junior bull calf—1 and 4, Baird on Nockdair King Superba New Year and Nockdair King Superba Prize; 2, Mann on Farsee Superba King; 3, Meadow Lane Farm; 5, Carnation on Carnation Prince Elba; 6, Kloehn on Sir Walker Johanna.

Cow 4 years or over—1, Meadow Lane on Cande DeKol Westview; 2, Baird on Jennie Segis DeKol Burke; 3, Titel on Vickery Vale Beechwood; 4, Stack on Fannie Benitje Bug 2nd; 5, Rust on Ida Lotta 5th; 6, Fisher on Tyrena American Ivy. Cow 3 years and under 4—1, Mann on Farsee Soldene Segis; 2, Fisher on Pledge DeKol Fisher. Heifer 2 years and under 3—1, Baird on Nockdair Segis Longfield Gene; 2, Fisher on Alcartra Jewel of Rock; 3 and 6, Rust on Aaltji Sola Rosella May 2d and Beiumkje Clothilde Cornucopia 4th; 4, Wendlandt on Colantha Johanna Pietertje DeKol; 5, Weeks on Johanna Pontiac Barbetta Excell. Senior yearling heifer—1 and 3, Fisher on Fisher Woodcrest Canary and Valdiva Fan Ormsby; 2, Kloehn on Forest Walker Johanna. Junior yearling heifer—1, Kloehn on Forest Johanna Beauty; 2 and 3, Fisher on Columbia Rue Sarcastic and Gloria Rue Sarcastic; 4, Wendlandt on Lady Yerlet Piebe; 5 and 6, Rust on Aaltje Salo Princess Hattie 6th and Aaltje Salo Rosella Daisy. Senior heifer calf—1 and 6, D. J. Howell; 2 and 3, Baird on Nockdair Superba Pontiac Fayne and Nockdair Superba Pontiac Carona; 4 and 5, Kloehn on Lady Walker Johanna and Daisy Walker Johanna. Junior heifer calf—1, Mann on Farsee Superba Queen; 2, Kloehn; 3, Wendlandt; 4, Meadow Lane; 5, Fisher.

Aged Herd—1, Rust; 2, Wendlandt; 3, Fisher. Young Herd—1, Fisher; 2, Rust. Calf Herd—1, Baird; 2, Mann; 3, Meadow Lane; 4, Stack; 5, Rust. Get of Sire—1, Baird; 2, Mann; 3, Kloehn; 4, Fisher; 5, Wendlandt. Produce of Cow—1, Titel; 2, Rust; 3, Kloehn; 4, Fisher; 5, Wendlandt.

Senior Champion Bull—Downing Pontiac Butterman Jr. Junior and Grand Champion Bull—Nockdair King Superba Gladice.

Senior and Grand Champion Cow—Cande DeKol Westview. Junior Champion Cow—Farsee Superba Queen.

Corn silage and alfalfa make in themselves practically a complete balanced ration for dairy cows. Alfalfa hay fed to animals has much the same laxative effect on them as June pasture. A dairyman at Elgin, Illinois, having 50 cows, says that every month's feeding of alfalfa in winter gives him a month of practically pasture conditions. "The cows show the pasture-effect in the glossy condition of their hair and in the yield of milk, and have never before looked quite so well."—Hon. F. D. Coburn.

Cow Testing Associations

RECORDS, PRICES OF FEEDS, FAT, AND MILK

Following is the summary of reports received during the past week and up to the time of going to press of this issue:

State	Association	Tester	Month	No. of cows tested	No. of cows producing over 40 lbs. fat	Fat production of high cow	Owner

Association Notes

Mr. F. M. Colcord, dairy field agent in Washington, makes the following statement concerning dairy conditions in several of the associations in that state:

"During the months of July and August I visited the Stillaguamish, Wahkiakum, and Duvall Associations. For a short period of perhaps five weeks the pastures were short in the vicinity of Duvall. However, in Wahkiakum during the months of June and July the pastures were almost knee high. The 22nd of August I visited the tester in the Stillaguamish Association and was surprised at the abundance of pasture. The young clover, red and white, appeared as tender and green as we might hope to find in May.

Having ideal pasture conditions, plenty of succulence for the summer and winter ration, such as kale for silage, either winter wheat and vetch, peas and oats, oats, barley, or perhaps corn, the cows do not know the change from green to dry feed.

The winters are mild on the west side. The pastures are good as a rule until very late and in some sections good all winter. Thus the cows are developed to a high degree of efficiency due to equable climate and an abundance of roughage. It is not due so much to individuality and the breeding as to development and producing a continual flow of milk for a long period.

Arkansas Valley, Colorado:—In August the condensery paid our members $2.75 per hundred pounds for milk testing 3.5 per cent. Milk retails for 12c and butter for 50c. Alfalfa hay is priced locally at $21 per ton; silage, $8; corn chop, $69; bran, $29; shorts, $31; and beet pulp, $40.

Eastern Bradford, Pennsylvania:—There have been several carloads of feed bought during the last month and a few cows sold out of our association. The July price for three per cent milk here was $2.19 per hundred pounds. The creamery paid 47c to 48c for fat and retails butter for 42c to 50c. Cheese retails at 32c per pound. Gluten costs $47.50 to $50 per ton; wheat bran, $50; and buckwheat feed, $40.

Laurel Hill, Pennsylvania:—Three per cent milk sold here in July for $2.17 per hundred pounds. The creamery paid 55c for fat and retails butter for 45c. Milk retails for 10c per quart. Gluten costs our members $49 and oil meal $57.

Canton, Pennsylvania:—The July price for milk here was $2.11, a test of three per cent being required. Gluten sells for $47 per ton; hominy, $50; hay, $12; silage, $5; Unicorn, $60; bran, $45; oil meal, $57; cottonseed meal, $59; and ground oats, $60.

Craftsburg, Vermont:—In August our creamery paid 50.5 cents for fat and retailed butter for 47c. The cost of Unicorn here is $62.50 in bulk and $67 in bags. Most men are feeding this, as other grains are hard to get.

Winona, Division A., Minnesota:—One pure-bred sire of high quality was purchased during the month and 21 high grade cows and heifers were bought to take the place of scrubs which were not paying. At the St. Charles Fair milk testing was demonstrated in a booth which attracted a great deal of attention. Field meetings are being planned so that feed may be bought cheaper. A stock sale is also being planned which will include pure-bred cattle and high grades. None of the members in the association fed grain in August.

Farm machinery is still advancing in price. It's well to remember, therefore, that a fence corner or an apple tree will not protect a machine from rain and rust.

Tillamook Association Engages Lady Tester

PEARL SNEDEKER

Miss Pearl Snedeker, who lived on a farm in Iowa until she was twenty-two years old, has recently resigned her position as teacher in the Albany High School to take charge of the testing association at Tillamook, Oregon. Miss Snedeker is very much interested in dairying, and says she much prefers the testing association work to teaching.

There are seven hundred and sixty-one cows in the association which she has charge of, which is located in one of the best cheese sections in the United States. The cheese factories in this section manufactured 4,974,382 pounds of cheese last year.

Miss Snedeker has a Ford car in which she travels from one dairy to the other and since all dairies are close to cheese factories, the testing is done in the factories where a steam tester is used.

During the month of July the 761 cows in the Tillamook Association averaged 759 pounds of milk and 31.68 pounds of butterfat per cow; 105 cows produced over 40 lbs. of fat apiece.

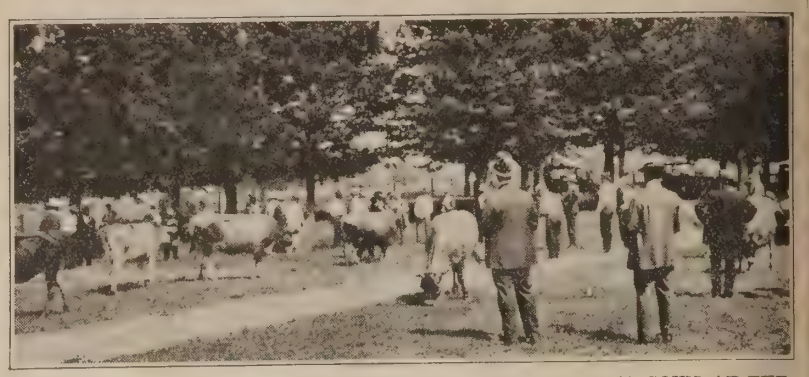
When Writing to Advertisers, Mention Hoard's Dairyman

Missouri Farmers Learn from Wisconsin Dairymen



HOARD'S DAIRYMAN:—Thirty farmers from Northeast Missouri, under the guidance of Extension Agent A. C. Ragsdale of the University of Missouri, District Agent E. J. Trosper, and County Agent H. T. Neilsen, have lately made a dairy farm tour of Fond du Lac and Waukesha Counties, Wisconsin. The Missourians came from the "show me" state to see with their own eyes what the dairy business has done for Wisconsin and to study the methods that have proven most successful on Wisconsin farms.

These Missourians were entertained in Chicago and Milwaukee by auto tours of these cities arranged by the Associations of Commerce in each place. In Fond du Lac, Wis., the splendid co-operation of the Holstein, Jersey, and Guernsey breeders' associations and the Association of Commerce, in arranging for the two-day auto tour of the county, insured the Missourians a profitable and pleasant stay. The same courtesies were extended to them in Waukesha County. They visited representative farms of the various breeds and gave special attention to those things that had, in the main, been the fundamentals of success on each farm. Farm crop methods, home grown feeds, feeding practices, growing of young stock, cow testing, and good pure-bred sires were emphasized everywhere. The farm houses and barns were studied. One Missouri farmer says: "Well, it is not so much that these dairymen are more prosperous and have more money in the bank than most of o farmers that hurts me so much that these fellows live better than do. Why, nearly all of them ha running water in the house, elect lights, and all those things!" Anoth says to the leader of the party: "Y are going to have a hard time to g us to leave Wisconsin." All this mea these farmers from the "show m" state noticed everything, even the l tle details and they are going to p them into practice and show the oth fellow—their neighbors back in M souri.

These farmers learned lessons fr such men as Math. Michels, form president of the Wisconsin Sta Dairy Association; S. H. Bird, pre dent of the Wisconsin State Holst Breeders' Association; Charles Peterson, secretary of the Wiscon State Jersey Breeders' Associatio Charles L. Hill, Guernsey breed and a large number of other succe ful dairy farmers, each of whom t his story in a short, straight-forwa talk which he gave to these Missou ans when they visited his farm. P fessors D. S. Bullock and Reid M ray represented the University Wisconsin and gave their expert sistance to the delegation from M souri.

This is the second trip of this ki made by delegations of farmers fr Missouri, and A. C. Ragsdale, w has accompanied both delegations, of the opinion that occasional trips this kind are one of the most practi forms of dairy extension work cause each man sees and believes.

"Condensed Milk and Milk Powder"

A revised and enlarged edition of O. F. Hunziker's book on "Condensed Milk and Milk Powder" has recently been published. This text is authoritative and is the most up-to-date and complete treatise which has appeared on the subject. Manufacturers, investigators, instructors, and commercial chemists have found the first edition highly valuable. The second is a complete revision of the first and contains in addition 75 pages new material.

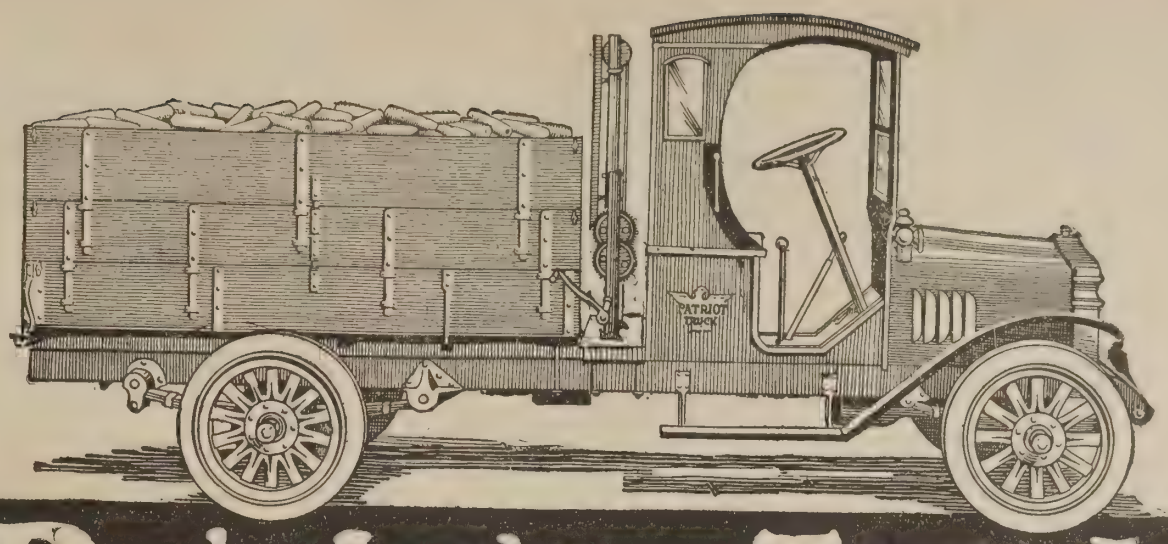
From the preface of the new pul cation the following interesting sta ments concerning the changes in condensed milk business are taken

"Old processes have been modif and improved, new processes ha been invented, the equipment u for manufacture has underg changes, new tests have been devi for the determination of the comp tion of the finished products and entire status of the industry yielded to an unexpected, unforese and important evolution."

Lyon's New York Dairy Notes.

(Continued from page 287)

only a part of the six months' period this month, but all the news we get from headquarters indicates that a full six months' price is contemplated. Farmers did not like the monthly prices last winter and spring, but it is likely that there was less trouble by that method than otherwise under the conditions as they were at that period. Now it is a question whether anyone can see far enough into the future to determine what will be just to all parties for a six months' period. I am looking for a full period price to be fixed, but would as soon see it made for half of the time now and then see what the situation may be for the later months. Hope to see that fairly settled by the twentieth.



There is activity in the regions where milk was refused in July. At Walton where the milk was said to be too rich then, and the condensery refused to buy it except at a discount, and even the fluid dealers would take it only on commission, now full prices are being paid and there is competition in its purchase. At present I do not know of a locality that is not getting full league prices, unless it may be at some place where cartage is high, and it is not certain that these places are being cut. In cheese territory the milk dealers enter and take much of the product and the manufacture of cheese is of course less than it has been.

The speaker to whom I have alluded predicts rather short supply of good feeds and higher prices. Here we have another reason for higher milk prices before spring. Feeds have already advanced quite a bit since three months ago. Some are still saying that there is to be a good supply of wheat bran. I have had only one chance to buy bran this summer and then could get only one ton. A little wheat is offered now, but it is likely to be grabbed. The price does not seem to be higher than allowable, although it is higher than the Food Administration gave us to understand it would be. Cash at the car is now $43 a ton for the feed, and no bran to be had so far as I know. Small use to fix a low price on bran if we cannot get any. Possibly there will be a little before snow.

In closing his remarks one thing came out partly by direction and partly by inference. We grumble too much sometimes. We are not quite satisfied with our lot. We should be cheerful and inspire others with optimism. Not the careless sort but mixed with enough pessimism to make us careful and avoid trouble. We are not as hopeful and buoyant as we should be. Be as proud that we are farmers as is the lawyer of his profession or any other man of his. It may not be so much of a money making life but it is larger and more helpful. Who does not wish to be helpful? Farming ought to be rather more profitable than it is, but when it comes right down to the truth we do not want it to be profitable in the sense that some other occupations are profitable. Then we would miss the wonderful helpful influence of the farmer in the community and the nation.

It so chanced that after the addresses I had an opportunity to meet a man of an adjoining county who has been put forward by four counties as a candidate for Congressman. He is a real farmer. He told me that out of the 43 Congressmen in this state not one is a farmer, and if I am not mistaken the same thing may be said of the situation for many years back. The most important industry we have totally unrepresented for many years. Organization among farmers is likely to make some difference in this regard in the years to come. I do not fear that farmers will go too far in organization as have some of the labor organizations. This we have already cautioned against, and I am glad that it isn't done, but farmers are not likely to do that, I think.

New York. H. H. LYON.

Patriot FARM Truck

Built for Country Roads
Built for Country Loads

The Patriot is the first Motor Truck built especially for farm work. *It is equipped with a practical farm body,* similar to what you have always used on your farm wagon.

It saves horses and high-priced feed. *It brings better markets nearer,* for with a Patriot you can readily drive loads to a market 100 miles distant.

It lays down 15,000 to 20,000 pounds at market in practically the same time that a team will deliver 5,000 pounds, literally bringing the farm to about one-fourth its actual distance from market.

Business farmers can easily see how such perfect transportation greatly increases the value of their farms, to say nothing of the convenience in being master of roads and weather. Every farmer with 160 acres or more should find out what a Patriot **Farm Truck** will save. Write for information.

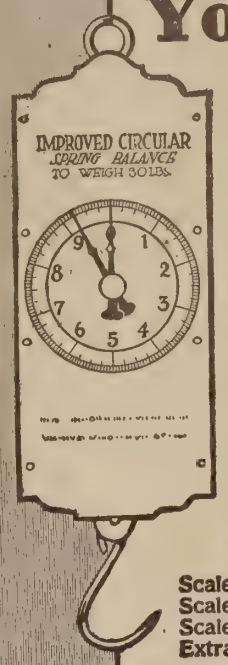
The Gore Amendment

The following is the Gore amendment attached as a rider to the agricultural appropriation bill. Our comment upon this amendment will be found upon the editorial page.

"That it shall be unlawful, except as herein otherwise provided, for any person, firm, or corporation knowingly to ship, offer for shipment, or transport in commerce among the several states or for commerce with foreign countries any concentrated commercial feeding stuffs containing any damaged feed, mill, elevator, or other sweepings or dust, buckwheat hulls, cottonseed hulls, peanut hulls, peanut shells, rice hulls, oat hulls, corncobs ground, cocoa shells, clipped oat by-product, ground or unground hulls, screenings, chaff, or other cleanings derived from the preparation, cleaning, or milling of any seed or grain when separated from the standard product as an offal or by-product, or such preparation, cleaning, or milling, humus, peat, spagnum moss, ivory-nut turnings, ground cornstalks, flax-plant refuse, sorghum pulp, ground or shredded straw or hay, sawdust, cellulose, or dirt, or any other foreign material.

New York Butter Market

New York City, September 17:—Since last week quotations on butter have advanced a full three cents and the upper limit does not appear to have been reached. Demand continues to be keen and practically all fresh lots of butter are snatched up eagerly by buyers as soon as they appear. Supplies continue moderate with indications that there will be a gradual increase during the coming weeks of improved pastures and freshening cows. Already the influence of those factors is being felt. The one great factor which is limiting shipments of butter to this market is the one of local demand. The writer had occasion during the past week to visit a considerable number of creameries located in a middle western state. Almost invariably at each creamery he was told that the entire output was being used to satisfy local demand. Undoubtedly the local demand is no greater than normal but as the output of all creameries has been greatly reduced because of the hot, dry summer, local markets have reached out to get butter from plants other than those which have regularly supplied them.



The following quotations on extras (92 score) by days shows the trend of the market: Wednesday, 53c; Thursday, 53@53½c; Friday, 53½@64c; Saturday, 54c; Monday, 55c; and today (Tuesday), 56c. Quotations on all grades of butter have kept pace with those on extras except that the range of prices on undergrades has been widened. That is a natural consequence of high prices as buyers are loth to pay extremely high prices for poor butter. Additional quotations today are as follows: Higher scoring

If Cows Could Choose
They would ask for the—
Universal
natural milker
Alternates, Like Milking With Hands

It is the alternate suction and massage action of the Universal that largely accounts for its tremendous success.

It milks *nature's way*—permitting the cow to relax, because she does not have to release on four teats at a time.

While the gentle massage acts pleasantly on two quarters, stimulating the milk flow, the suction is milking two other quarters

With a Universal you *benefit the cow* and frequently *increase* the milk flow, *in addition* to saving your time and putting you on a modern, efficient money-making basis. Write us.

"YOU HAVE, IN MY JUDGMENT, THE BEST MACHINE ON THE MARKET."
Sunny Side Stock Farm,
Evans Mills, N. Y.
Per G. P. Ashbocker

The Universal Milking Machine Company
404 Mound Street, Columbus, Ohio.

than extras (93 score or above), 56½ @57c; firsts (87 to 91 score), 52@ 55½c; and seconds (83 to 87 score), 47@51c. Unsalted butter is quoted two cents higher than corresponding grades of salted butter.

When the Food Administration requisitioned 60% of available storage stocks the maximum margin (net) allowed dealers on such butter was placed at one cent per pound. Dealers, feeling that the margin is scarcely large enough to permit of sufficient profit to meet operating expenses, have entered protest to the Food Administration. In consequence, it is expected that some satisfactory adjustment of the order will be made.

W. B. LIVERANCE.

Dairy Cattle Congress

With a wealth of educational features that will appeal directly to the farmer, practically everything is in readiness for the ninth annual Dairy Cattle Congress to be held at Waterloo, Iowa, Sept. 30 to Oct. 6, inclusive.

The greatest dairy cattle in the country will be on exhibition. Herds are arriving from east, west, north, and south—herds that have appeared at all the leading state fairs where they captured the majority of cash prizes and blue ribbons. Although the showing of cattle last year was pronounced by experts to be the greatest ever seen in the West, indications are that it will even be eclipsed this year.

Exhibition hall, containing more than 48,000 square feet of space, will be a veritable school of instruction. There will be large displays of farm machinery, dairy equipment, and hundreds of booths containing articles of every description of interest to the up-to-date tiller of the soil and breeder of pure-bred cattle.

Educational exhibits will consist of booths arranged by the national and state food administrations. The fuel administration will also have a booth. Canning demonstrations and exhibits of garden products and handicraft are other educational features that will be of interest.

There will be in operation every minute of the day a working creamery. A tractor and motor truck exhibit, with daily demonstrations, will appeal to the farmer. Tractors shown will be of the light type, suitable for operations in the Mississippi Valley.

The annual convention of the Iowa State Dairy Association will be held October 3 and 4 in conjunction with the Congress. An interesting program has been prepared which will include addresses by M. D. Munn, president of the National Dairy Council; D. D. Aitken, president of the Holstein-Friesian Association of America; and many others prominent in dairying.

The Interstate Dairy Councils will also meet on Friday, October 4. This will be the first complete meeting of the organization and history is expected to be made before the meeting adjourns. Both afternoon and evening sessions will be held.

Dairy cattle sales, the cow testing association exhibit, and cattle judging in the new arena which has a seating capacity for 5,000, are additional features.

Iowa. E. S. ESTEL.

War and Posterity

Unavoidably many of the millions of men now struggling on the battlefields of Europe will not return to their homes. The absence of these millions from homes is inevitably cutting down the birth rate of every nation at war. With the flower of our youth engaged in the nation's defense, at a time when normally homes would be established, the natural growth in population is checked. The realization of these conditions prompts thought of national self preservation in the minds of leaders of all the great government and private agencies devoted to problems of our national life.

The Children's Year, launched by the Women's Committee of the Council of National Defense, under the leadership of the Children's Bureau of the United States government, is a campaign to preserve to the nation the lives of a hundred thousand children who normally die from preventable causes through the unconscious ignorance of parents.

The admittedly large percentage of army draftees, who fall short of necessary physical development for admission to the army, has directed the attention of all to deficiencies in our home life, as applied to the rearing of children born in American homes. The wonderful results attained in our American camps show that much may be done by an aroused people to insure stronger, healthier men and women. These are the motives which prompt the Children's Bureau, the Department of Agriculture, the Food Administration, and the Bureau of Education to join with the National Dairy Association in presenting to the American people, through the medium of its annual exhibition at Columbus, Ohio, October 10 to 19th, not only the aids and inspiration to greater dairy production, but the more vital consequences of the relation of dairy production to human preservation and welfare.

Hundreds of thousands of mothers and fathers have yet to learn the undisputed fact of science that nature locks up in milk an essential something necessary to the fullest development of child life. The cow, "the foster mother of half the human race", is so called because half the babes born to man must depend upon her milk and all children should, through their early life, have a liberal portion of milk and butter if they are to develop into strong, virile, prepotent men and women. The uses of these dairy products, the saving of these young lives, will be fascinatingly presented to the public by actual demonstrations in the use and preparation of dairy products by the Children's Health Conference, conducted by the National Children's Bureau, where parents may bring their children and have them examined by government experts, and where they may receive helpful suggestions for improvement in the development of their children.

Infant welfare workers, public hygiene authorities, visiting nurses' associations, mothers' clubs, home economics' associations, teachers of domestic science,—in fact all men and women engaged in the problems of conservation and improvement of child life, are invited by the government to take advantage of this first great Welfare Exposition held at the National Dairy Show, Columbus, Ohio, October 10-19 inclusive, 1918.

H. E. VAN NORMAN.

National Welfare Exposition at the National Dairy Show.

Indiana Milk Prices

At a meeting in South Bend, September 16th, of the milk producers and distributors, together with the county food administrator, the food administration set the price of milk to the producer at 30c per gallon for legal milk, 3.25%. The distributors are to charge the consumer 13c per quart Sept. 23rd. This covers the price for St. Joseph County, Ind.

IRA M. ULLERY, Sec'y & Treas.

Jersey Cattles Notes

For week ending Sept. 13, 1918:

Number of animals registered: Bulls, 165; cows, 414; total, 579. Number of transfers recorded: Bulls, 106; cows, 398; total, 504.

"You're mighty lucky to have those Lambertville Boots"

"You bet I am. They were the last pair in the store. There'll be mighty few Lambertvilles for some time."

"Why, I need a pair now. Surely I can get them somewhere."

"No sir-ee, not unless you happen on an odd pair that a dealer has left over. You see the Government's taking nearly all the factory can make."

"Gosh—Sherman sure was right!"

Lambertville enthusiasts are naturally disappointed at the scarcity of their favorite rubber footwear. Dealers, too, are disappointed because Lambertvilles meant good business, rapid turnover and good will wherever sold.

But everybody realizes that war is war and that the Government's demands come first. And no one will forget the boots, arctics, etc., that have set a new standard in rubber footwear. When it is possible, we will again supply dealers with our full line of rubber footwear.

Until such a time, we ask your tolerance of this unusual condition, over which we have no control.

LAMBERTVILLE RUBBER CO., Lambertville, N. J.

EDITORIAL COMMENT

Every right implies a corresponding obligation; every privilege a corresponding duty.

REGULATION IN SHIPPING FEEDS

Senator Gore has attached an amendment to the Agricultural Appropriation Bill which aims to control the interstate shipment of certain feeds when mixed with other feeds. The text of this amendment is published elsewhere in this issue.

We are opposed to the Gore Amendment. If legislation is required to govern the interstate shipment of certain feeds, it should be incorporated in a separate bill and opportunity given for discussing it. There are few men so well informed upon any particular subject as to give them sufficient knowledge to write a bill that would be fair and just to those whose business such legislation would regulate. If the Gore Amendment should become a law it would prevent the mixing of ground alfalfa with other commercial feeds for interstate shipment. It would prevent the use of wheat screenings, a valuable feed, to be mixed with other feeds for interstate shipment.

There are meritorious things about the Gore Amendment; for instance, it would prohibit the mixing of buckwheat hulls and rice hulls with other feeds for interstate shipment. It is our opinion that such materials as these should be prohibited by law to be mixed in feeds at any time. These feeds are not only worse than worthless, they are positively injurious.

The bill also provides that feeds of low nutritive value shall not be mixed with commercial feeds for interstate shipment. Some of these feeds are cottonseed hulls, oat hulls, ground cornstalks, etc. These feeds are used by commercial firms and by feeders for lightening the meal portion of the ration. In times of peace it is our opinion that legislation prohibiting interstate shipment of any feeding stuff would be unconstitutional. In times of war government necessity for shipping space might make it feasible to prevent the shipping of feeds low in nutritive value. In times of peace, however, we do not believe that the government or any other group of men has a right to say what kind of feeds a purchaser shall buy. Our feed laws inform the purchaser of the composition and the kind of feeds that enter into a mixture, and he must determine whether it will meet his requirements or not.

It is certain, however, that the Gore Amendment was hastily drawn and is so full of imperfections that, if passed, it would work injury to the feeders of this country. It should be "killed". There may be a necessity for legislation of this character. If there is, then a bill should be drawn incorporating the several feeds which might be omitted from interstate commerce and then a discussion should follow, by those informed regarding the value of feeds, before a committee to which the bill has been referred. Hasty legislation of good intent does not prevent working hardships upon those whom it is to govern. A bill of such importance needs careful consideration or there is danger of creating more evil than it will correct.

We believe there is opportunity for legislation which will prevent the use of materials of no nutritive value and which are injurious, and there may be a necessity for governing the shipment of material low in feeding value. For example, it is the practice of some feed manufacturers to mix about 800 pounds of cottonseed hulls with 1,200 pounds of cottonseed meal for producing one ton of cottonseed feed. There are few, if any, farmers in the North who require cottonseed hulls because cornstalks or chaffed straw would take their place.

A moment's consideration of the Gore Amendment will reveal the necessity of giving such legislation more serious thought than is possible where it is acted upon as a mere rider to the important agricultural bill and thus is made a question of purely incidental interest and small import.

OUR BREADSTUFF

Herbert Hoover has a family of about 220,000,000 people. At least this is the number of people fighting Germany, and it is Mr. Hoover's job to see that they receive proper rations.

Several months last year he requested that we use 50% substitute with wheat flour. This request continued until September 1st when word came that all that was necessary to use was 20% substitute with wheat flour. Substitutes include barley, corn, rice, potato flour, etc. When rye is used to supplement wheat flour, two-fifths of rye and three-fifths of wheat flour are required. He also informs us that a Victory Flour properly mixed will be placed on the market. This seems to us a very wise provision as it is often very difficult for the housewife to secure, at times, suitable substitutes. No loyal woman will object to making bread from Victory Flour and no loyal man will seriously object to eating such bread. We are willing to make this slight sacrifice, if it be one, for the cause in which we are engaged.

It is our opinion that wheat flour containing a little corn flour, or any other flour, is really more nutritious and nourishing than simply wheat flour alone. We may well have pride in the fact that we and our allies have been able to increase our breadstuffs so that it is only necessary to use 20% substitutes. We take it that our food administrator would not have lessened the amount of substitutes to be used if there were not an adequate supply of wheat to permit us to use 80% wheat flour.

Next year, the Department of Agriculture expects the farmers to grow 45,000,000 acres of wheat, 27,000,000 acres to be winter wheat. A yield of 1,000,000,000 bushels is desired, as against about 850,000,000 to possibly 900,000,000 bushels this year.

We can well be proud that through conservation we saved enough wheat to supply our allies and through extra effort have secured an adequate supply of breadstuffs for the coming year.

LIMITING CREAM STATIONS

Elsewhere in this issue of Hoard's Dairyman we publish an article from Mr. J. A. Boyer commenting upon our editorial entitled: "Limiting Cream Stations".

We fully appreciate that there is no necessity for two or three cream stations in one city, and that a cream station is unnecessary where a creamery is properly serving the farmers. We most heartily believe that farmers should build their own co-operative creameries and operate them on business-like principles. The cream buying station can not pay as much for fat as a well patronized and properly operated co-operative creamery. We believe, too, that the farmer who leaves his co-operative creamery to sell cream to a local cream station is working against his own interest and in time will be led to see his mistake. But, granting the advantages of the farmers' co-operative creamery and that the cream station is unnecessary, we believe a law preventing the establishment of more than one institution in a city for the purchase of cream would bring more dissatisfaction than the evil of having a creamery and several cream stations.

Our correspondent says: "If he," referring to the producer, "has not enough intelligence to ship his cream to his chosen centralizer, then and only then does he need a cream buying station." Whose business is it where and how a milk producer or cream producer markets his product? What farmer wants a law which will compel him to market his product in channels defined by law?

Under war conditions we are all willing to put up with anything to win the war, but in times of peace we do not believe that the milk and cream producers of this country desire to have laws prescribing how and where they shall market their products.

"IS COW MILK DOOMED?"

This is the title of a news item in one of the commercial journals published in Chicago. The article goes on to state that the chemical laboratories of A. D. Little, Inc., have announced the discovery of a process by which an ample supply of fresh milk can be assured to a city "without a cow within 10,000 miles". This product is made from cocoanut oil and powdered skimmilk. The process has been patented, but as announced has not been worked out on a commercial scale. It is also stated:

"We can get whatever type is wanted: thin milk, rich milk, half cream, full cream, or even thick, clotted Devonshire cream. It tastes like milk and cream, contains substantially the same bodies, is slightly more digestible than the original cow product, while its keeping qualities are fully as good if not better. If this new discovery should turn out practical, it will play havoc with our dairies, the incomes of the dairy papers, and the advertising of milk products, condensed milks, etc."

For a long time scientists have been attempting to manufacture a product which will take the place of cow's milk. So far, they have not been successful. While their product may show about the same chemical composition, yet chemistry does not reveal all the essential elements of a food product. Several scientists have demonstrated that milk contains certain substances necessary for growth and that when butterfat is eliminated from the milk, children are subject to certain forms of disease such as sore eyelids, skin eruptions, etc. This was prevalent in Denmark where a large amount of skimmilk had been consumed and butter substitutes used for milk fat. Doctors found that when the children were fed milk fat the sore eyelids and skin eruptions disappeared.

It may be stated, further, that this particular product requires the use of cows to produce the skimmilk, which in itself assures dairymen that no calamity is coming from this source to the dairy industry. To say that such a synthetic product is equivalent to milk is not stating facts, and we may be thankful as dairymen that the pure food laws will compel these inferior products to sell upon their own merits. We have a number of men who term themselves scientists that are ever on the lookout for manufacturing substitutes which, if consumed as their makers would like to have them, would soon make us a race of inferior people, both mentally and physically. The American is too intelligent to be misled in any considerable numbers into using substitutes, for they know their effect.

INDIVIDUAL RESPONSIBILITY

The Fourth Liberty Loan campaign opens on September 28th. The amount asked for has not been officially announced, but it is expected that it will be either five or six billion dollars. This is more money than any nation has ever asked of its people at any one time. America will respond, and its response will be one of the large factors in upholding the morale of the forces of the allied nations and in destroying the morale of the central powers, a morale that the American soldiers gave a stinging blow when the German advance was checked at Chateau Thierry.

But let us not indulge in any illusions. It will be no easy task to raise this sum of money, even in prosperous America. Let us put over-confidence and the insidious words of propaganda behind us and give heed to our country's call. It is our job, one we can not leave to our neighbor. It will call for sacrifice and devotion on the part of every loyal American citizen, and each man must accept the success of the loan as his individual responsibility, his great opportunity.

To raise this sum of money should be the chief business of every citizen while the campaign lasts. The farmer has responded nobly to his country's call for food, he has given liberally of his money, he has sent his sons,—a gift without price. Yes, the farmer has demonstrated his patriotism and his ability. In this matter of the Fourth Liberty Loan he will also acquit himself well. It is not a time for self excuse, for argument, or for shifting responsibility. It is the call of patriotic duty and a wholesome regard, not alone for public opinion, but a wholesome regard for the times that come when a man stands naked before the self analysis of his own soul. The man who fails will find that, in the quiet time when he is by himself, his own guilty conscience will point the scathing finger of scorn at him, a scorn more scorching than the public at large or the returning soldier can ever inflict, heavy as these may be to bear.

In the spirit of liberty and devotion, with the acceptance on the part of each of us of our own personal responsibility to do all and more than our share, the Fourth Liberty Loan can and will be made the most brilliant of all. Only when our duty has been well performed and the needs of our country are fully met, may we expect the Master's blessing: "Well done, thou good and faithful servant."

COUNTY ADVERTISING

The dairy cattle industry of two Wisconsin counties—Waukesha and Calumet—was given effective publicity at the 1918 Wisconsin State Fair.

Waukesha County was advertised as "The Dairy County of The World" in an attractive leaflet distributed among the visitors at the fair who were interested in dairy cattle. Proof for the claim was submitted in statements concerning the number and quality of the representatives of the four major breeds which Waukesha breeders own. It was set forth that Waukesha has more dairy cattle than any other county in the world, that it has more tuberculin tested cattle than any other county and will soon have all of its cattle tuberculin tested, and that Waukesha breeders stand back of their stock. A certain representative for each breed was named and inquirers were directed to address him for information.

A 48-page pamphlet enumerated the desirabilities of Calumet County as "The Garden Spot of

Wisconsin". The high food value of milk was illustrated by cuts and explanatory paragraphs. Prominence was given to the enterprise of boys who have engaged in calf club work; the memberships of the farm management club and of the county order of the Wisconsin Experiment Station were listed. The Holstein and Guernsey Breeders' Associations were listed with their officers and members. The educational matter contained made the booklet as valuable for home distribution as for calling the attention of state fair attendants to the virtues of Calumet County.

The publicity thus gained benefits these two counties largely. It awakens a new pride within their own confines as well as being directly valuable in increasing outside interest in the wares for sale by the farmers and breeders. Of such enterprise is progress made.

Raising Calves Without Milk

We have been trying to raise calves by the use of milk substitutes, giving whole milk the first week, then gradually changing to the calf meal. We have had very indifferent success; the calf usually lives through it but we have all kinds of trouble. They get the scours and get very thin and I do not think that they ever make as good cows as they would if they had a good start. Can you tell me how to raise them successfully in a way that won't cost more than they are worth. We would like to grade up our herd to pure-bred Holsteins, but do not feel justified in going to the expense of purchasing a good bull until we are sure we can raise the calves successfully.

Royersford, Pa. E. P. B.

Whole milk is the ideal feed for calves. There has been a great deal of work done in the attempt to find a substitute which will entirely replace milk in the calf's ration. While a number of feeds have been brought forth which prove generally satisfactory, we have yet to find a single one which will so well supply the calf's needs as its natural food, milk.

Figuring on the high value of well matured dairy heifers we believe that even at high prices a certain quantity of milk proves economical as a feed for calves. If substituting other feeds will stunt calves in their growth and make them less valuable as producers at maturity, it can readily be seen that to feed even rather liberal amounts of milk to young calves will prove in the end very profitable.

The practice which seems most desirable is to supply the minimum amount of milk, regardless of its cost, which will guarantee strong, healthy, growthy calves. In an experiment carried on at the University of Illinois, it was found that such calves could be grown when the minimum amount of whole milk supplied totalled about 150 to 175 pounds and when skmmilk was fed in addition to a total amount of 400 to 500 pounds. In addition to this quantity of milk good clover hay and concentrates were supplied the calves as early as they would be eaten.

For the first four days the whole milk from the mother was fed and at about the fifth day ten pounds of whole milk and two pounds of skimmilk were supplied and the mother's milk put in with the rest of the herd's. This quantity of milk was fed until the calves were about ten days old when the whole milk was gradually replaced by the substitution of skimmilk at the rate of one pound per day. The twelve pounds of skimmilk were then continued for about twenty days so that by the time the calf was six weeks old or a little less the milk was gradually reduced about a pound per day. By this time the calves were able to maintain themselves fairly well on choice clover and concentrates. Their growth was checked somewhat for a time but at maturity they had made good growth and were apparently as strong and vigorous as animals which had received considerably more milk.

The commercial calf feeds have been fairly successful and home-made mixtures have also proven valuable in feeding calves. In no case would we begin feeding these meals to calves under three to four weeks of age. Instead of following the practice which was used in the Illinois experiment, where milk is especially high in market value, it might be wise to begin when the calf is about three or four weeks old to gradually cut down on the skimmilk supply and to feed increasing quantities of a meal.

One of the satisfactory mixtures which may be made on the farm at a lower cost than the price of most calf feeds, with fully as satisfactory results, is one made up of equal parts of hominy meal, oil meal, red dog flour or shorts, and blood meal. Such a meal is quite satisfactory and if the management of the calves is in the hands of a good caretaker good results should be secured from its use. The blood meal has one of its several values in regulating the digestive system so that the calves are not apt to be troubled with scours as suggested.

Comparing Grain Silage and Hay

I wish you could give me the market value per ton of silage made from barley, rye, and oats, as I am selling some to my neighbors. Hay is worth $25 to $30 per ton, shorts $32, bran $30.

Forest Grove, Ore. I. J. H.

There is no real market value for silage and the best that we can do is to give an estimate. One hundred pounds of silage, composed of equal quantities of barley, oats, and rye, will contain approximately 26.8 pounds dry matter and 17.6 pounds total digestible nutrients. In 100 pounds of hay made from these same grains, there are 90.8 pounds dry matter and 49.2 pounds digestible nutrients. In digestible protein, two tons of this grain silage would be worth one ton of the hay, but giving credit for the higher relative carbohydrate content it would be fairly accurate to say that one ton of the grain hay is worth from two and one-half to three tons of silage. In comparing prices of these two commodities it is to be remembered that the price should be for the hay in the barn or stack and the silage in the silo, not the market value of the former.

What Price for an Acre of Corn

What is the value of corn silage? I have just purchased a farm and I have a cement silo 12'x42'. I wish to make arrangements with the former owner to put a portion of the corn crop now on the place in the silo.

Cement City, Mich. L. G. R.

Silage does not have any regular market value and it is next to impossible to estimate this with any degree of accuracy. During the past year silage has been sold in the silo at from $5.00 to $8.00 per ton and in some instances for more, the price varying according to the quality of the feed and the relative desire of the seller to sell and the buyer to buy. If there is any method of estimating the yield of ear corn per acre then possibly estimating the value of the silage on this basis would be most satisfactory as a basis of agreement with the former owner, paying him for the corn crop ensiled on the basis of its return to him if sold as ear corn. In other words, if the estimated yield per acre is fifty bushels and corn is worth $1.50 per bushel, then he would receive $75.00 per acre for the corn put into the silo.

Another method of estimating would be to pay for the silage on the ton basis, using its ear corn content to get the price. A ton of well-eared corn silage will contain from 4½ to 5 bushels of corn. Multiplying the 4½ or 5 by the current value of the ear corn per bushel would give a fair approximation of the amount of the silage. The amount of silage in a silo can be computed by using tables which have been prepared for this purpose.

Still another comparison of the value of silage, that is often made, is to compare it with timothy hay. On this basis one ton of timothy hay in the stack is said to be worth 2½ tons of corn in the silo. In other words, when timothy hay is worth $15.00 per ton in a stack, corn silage would be worth $6.00 per ton in the silo.

Mississippi Ration

Please give me a balanced ration out of the following feedstuffs at prices named: dried brewers grains, $55 per ton; wheat bran, $40; velvet bean meal, $48; cottonseed and oil meal, $52. These are the feeds that I can secure. I want cheapest feed out of the list.

Wesson, Miss. H. M. A.

Dried brewers grains supply nutrients at a somewhat higher cost than the other feeds listed. Also the two meals, velvet bean meal and cottonseed meal, are very high in protein content and supply about the same purpose. It would be desirable to feed only one of these meals, making a choice between the two dependent largely upon their market value. Because brewers grains are somewhat more expensive we would feed but a small quantity or would cut them out entirely. A high carbohydrate concentrate such as corn or hominy would add greatly to the value of the concentrate mixture. We recommend that a mixture be made up of 200 lbs. corn or hominy, 300 lbs. wheat bran, 100 lbs. dried brewers grains, and 150 lbs. of velvet bean meal or cottonseed meal.

The roughage part of a ration is fully as important as the supply of concentrates. Cows should receive all of a legume hay which they will consume. Alfalfa, clover, soy bean, cowpea, or velvet bean hay, fed in as large amounts as they will eat, makes a very good basis for economical milk production. Silage fed in addition at the rate of about thirty pounds per cow per day, except when the cows are on good pasture, also makes an economical basis on which to supply concentrates. In addition to the hay and silage the grain mixture recommended should be fed, to cows producing high testing milk, at the rate of one pound for each 3 to 3½ lbs. of milk produced. Cows producing low testing milk need but one pound of grain for each 3½ to 4 lbs. of milk produced.

Inoculating Alfalfa

Is inoculation from sweet clover soil as good as from alfalfa soil? Would both soil and chemical inoculation be a benefit or detriment? Does Grimm seed produce plants that withstand the winter better than other varieties?

Greenfield, Ind. J. W. R.

Soil from a sweet clover field that has made a good growth is satisfactory for inoculating a new seeding of alfalfa. It is just as desirable for this purpose as soil from an alfalfa field or the chemical inoculation. The latter method is considered more convenient by many people, and if the inoculating material is not too old and has been properly prepared it is, perhaps, somewhat more certain in its results. There would be no detrimental effect from using both the soil and chemical inoculation, but we do not consider this essential.

Because of its spreading root system, Grimm alfalfa will withstand winter weather better than the common alfalfa. However, one should be certain that he is securing the true Grimm seed as there is, comparatively speaking, but little of this seed on the market and its price is so much higher that there is a tendency to substitute other varieties for it. The Grimm has been tried in many states and has proven its worth. One of the most recent reports that we have received is that of a grower in Colorado who recently visited our office and stated that their seedings of Grimm in that section had withstood the winter much better than the common alfalfa.

Renting on the One-third Basis

In your issue of July 11th an article, "Renting Dairy Farms on Shares", appeared of which a paragraph on the general method of renting on one-third was written. Will you please inform me as to the subjects which generally appear in an agreement of this nature, and the usual form of drawing them up?

Milwaukee, Wis. E. H. S.

In reply to this inquiry, Mr. E. A. Boerger of the U. S. Department of Agriculture, author of the bulletin reviewed, writes:

"Probably too much stress was placed in the bulletin on this method of renting as only about 3 per cent of the tenant dairy farms we have visited were so rented. This system of renting is most frequently found where a son or a son-in-law of the landlord is the tenant and no written lease is used.

"I have come in contact with several methods of renting in which the owner furnished all the work stock, productive stock, and the machinery and tools, the tenant furnishing all labor, one-third of the purchased feed, and in return secured one-third of all stock increase and one-third of all crops and milk sold.

"Poultry usually requires a large amount of labor and on some one-third share rented farms I have visited, particularly in the state of Delaware, where much poultry is raised, the tenant got one-half of all eggs sold and one-half of all poultry increase. On such farms also where an intensive crop such as potatoes or tomatoes was grown, the tenant received one-half the sales from the intensive crop but only one-third of those of the ordinary field crops.

"On a dairy farm it would appear advisable to give the tenant one-third of all crops sold and of all dairy products sold and also one-third of all stock increase and require him to furnish one-third of all feed whether raised on the farm or purchased. In order to insure the proper repair of machinery, it would probably be advisable to require only one-third of the cost of repairs from the tenant.

"Were it not for the productive stock (cows, hogs, etc.) kept on the farm, the tenant could be given one-third of the crops grown and if there are other farms nearby on which the feed raised could be consumed, it might be best to do this and avoid the complication of giving the tenant one-third of the stock increase."

EMPIRE
MILKING MACHINES

The Recognized Standard

NEARLY every field of endeavor has its recognized standard—one manufacturer's goods that always loom up first in your mind when a product of its nature is mentioned.

It's true of cameras, pianos, locks, crackers, speedometers, watches and a host of other products.

And it's true of Milking Machines.

Visit the homes of prize winning stock of all breeds, go to the dairy farms whose chief object is the production of large quantities of milk or go to the small farmer who has only a limited number of cows. Everywhere you'll find the dominating milking machine to be the Empire.

Our 1918 Catalog No. 31, will tell you why or, if you choose, the local Empire dealer will demonstrate why. No charge or obligation.

Empire Cream Separator Company
Bloomfield, New Jersey
Chicago, Ill. Denver, Col. Montreal and Toronto, Can.

Grove City Creamery Picnic and Dairy Show

HOARD'S DAIRYMAN:—The first pure-bred dairy stock show held by the constituency of Grove City, Pennsylvania, Creamery, took place on September 7, at Barmore Lake, in connection with the Third Annual Patrons' picnic. In point of attendance, exhibits, and enthusiastic interest the occasion was a distinct success. The rapid progress toward prominence in pure-bred dairy cattle raising achieved by the community under the stimulus and encouragement of the Dairy Division of the Bureau of Animal Industry, under whose direct supervision the creamery is operated, was reflected by the number and quality of the animals exhibited, and by the universal interest shown in all the exercises of the day.

The judge was Professor A. A. Borland, of Pennsylvania State College, who took opportunity, by briefly stated reasons for his placings, to make the competition a demonstration in the judging of dairy cattle.

After dinner, the audience assembled in a natural amphitheater and brief introductory speeches were made by County Agents W. S. Hagar of Mercer, and H. S. Adams of Butler. A representative of the Grove City National Bank, which has been effective in establishing so many pure-bred herds in the community, spoke briefly of the definite intention to make the show a permanent and stimulating influence in the region, to exclude absolutely the element of cheap and noisome "amusements" that have debased and disgraced the so-called agricultural fair, and to continue to encourage by importation and distribution of registered stock the development of pure breeding in the community.

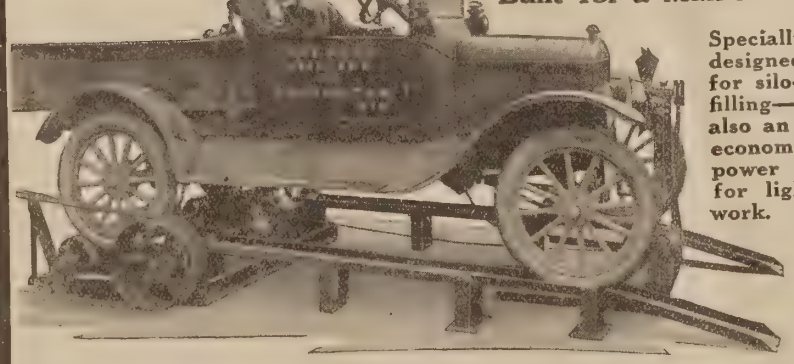
Mr. Helmer Rabild of Washington, in charge of dairy extension, U. S. Department of Agriculture, made the address of the day. Mr. Rabild spoke with force and pertinence out of a wide experience both in his native Denmark and in this country and was heard with the keenest interest.

As an earnest of the future, and an index of the possibilities of the locality, the show afforded its promoters (the commercial associations of the world are in marked contrast to the spirit of the occasion) deep gratification. The several organizations established within the past two years by Mr. R. R. Welch, the indefatigable dairy husbandman of the creamery staff, are rapidly revolutionizing the local business of dairying and are in an aggressively flourishing condition. The three breeders' associations, the bull associations with their sires of world famous breeding lines, and the Accredited Herd Owners' Association with a membership of over one hundred, are making their influence felt over an increasing area.

The exhibitors at the show were:

Holsteins: Lida Armstrong, M. M. King, E. H. Conner, Franklin Glenn, Homer Knauff, Wilson McClelland, W. A. Richardson, W. W. Richardson, J. W. Hunter, George V. Reed & Son, A. G. Opre, F. H. McDowell, Ernest Hassel, P. P. Winger, J. S. Ramsey, W. A. Tinker, E. P. Weber, George Long, Walter Knauff.

Jerseys: E. G. Barnes, E. A. McDowell, W. H. Davis, R. K. Cummings, Glenn Humphrey, David Studebaker, Mildred Cummings, P. H. Helm, Homer Long, T. F. Ritchey.



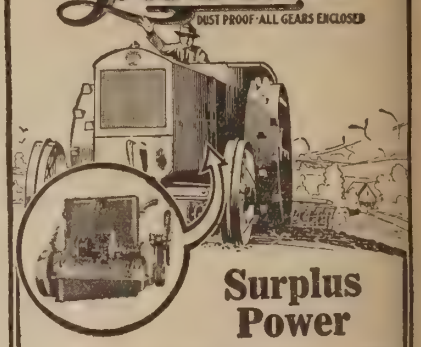
Guernseys: Hugh Fergus, J. M. Buchanan.

Pennsylvania. MORGAN BARNES.

The best time to do a good job is now. Putting it off makes it harder.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

The Auto Utilizer
A Real Power Transmitter Built for a Man-Size Job



Specially designed for silo-filling—also an economical power plant for lighter work.

Equipped with Hyatt Roller Bearings Throughout. Tires Run on Rubber Covered Rollers
Use Any Make of Car up to 125 Inch Wheel Base. No Attachments to Car—No Jacking Up.
Price, $220.00 F. O. B. Factory

The LAUSON 15-25
DUST PROOF ALL GEARS ENCLOSED

Surplus Power

The engine is the heart of a tractor. It must supply a steady flow of power. There must be power to spare. Soil conditions increase the draft at the drawbar. Wet grain requires more power at the belt pulley.

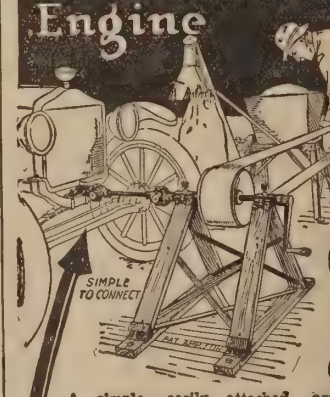
The LAUSON-BEAVER-valve-in-head motor has 30% surplus power. The valve-in-head principle is noted for its efficiency under heavy load. It burns kerosene successfully. It is dust-proof but accessible. The bore is 4½ inches and the stroke 6 inches.

Pulls Four Plows

The LAUSON 15-25 is rated a 3-plow tractor. And yet in the National Tractor Demonstration at Salina, Kansas, it pulled four 14 inch plows to an average depth of 7½ inches at the regular plowing speed of 2½ miles per hour through the entire demonstration week.

Designed for Belt Work

The LAUSON 15-25 is made to run the ensilage cutter, grain separator, corn sheller, feed grinder, rock crusher—any kind of belt work requiring surplus power.



Twenty-three Years of Engine Building Experience

For twenty-three years we have been making LAUSON Frost King Engines—the standard of farm engine excellence. 1½ to 28 H. P.

Breeders for 32 years of Holsteins of vitality and yearly production. Mack and Elliason in the Box.

Gunderson Stock Farm, (Near City Limits,) Portage, Wis.

New York Prices Advance 40 Cents

HOARD'S DAIRYMAN:—The New York milk situation is clear if I get the correct interpretation. The price for October and probably for November and December has been made. No announcements are yet given out, and my understanding is that there are to be further conferences after the fifteenth. I have talked with dealers and league officials, but am not permitted to quote either. My understanding is that the October price will be at least forty cents advance over September. That would mean at least $3.30 a hundred for three per cent milk at 150 miles from New York. The average then up-state may be assumed as pretty close to $3.50 a hundred pounds. November and December may be a little higher. No one should assume these figures as accurate for they are not official.

So far as I have learned, the dealers are not raising objections over the price. In conversation with a general manager of one of the larger concerns yesterday he seemed very optimistic, and is looking around for more milk. He had just closed a long-term contract the day before, leasing a large plant, and that in territory where the test is high. We have been told that at present prices dealers cannot handle milk of tests that are high. In the case of condensers and those in the powdered milk business, if not in the fluid order, high tests seem desirable. Cream of the forty per cent grade now sells readily at twenty-four dollars, and this taken from the five per cent sort of milk at forty cents a pound for fat leaves the milk in good grade for condensing at three or even four per cent, and makes a big profit on the cream. The ins and outs of the milk business are intricate.

New York. H. H. LYON.

Line Up

It ain't the guns, nor armament,
Nor funds that they can pay,
But the close co-operation
That makes them win the day.

It ain't the individuals
Nor the army as a whole
But the everlastin' team work
Ov every bloomin' soul.

LOUDEN
Detachable Water Bowls

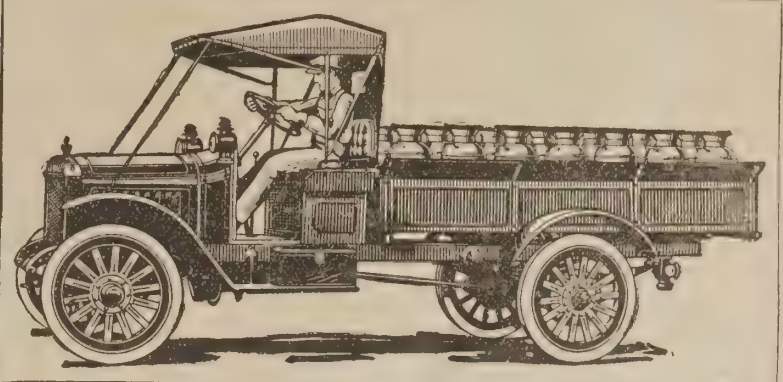
WM. LOUDEN
Originator of Modern Labor - Saving Barn Equipment.

Removed and Sterilized —the Work of a Minute

Louden Detachable Water Bowl represents the greatest improvement for indoor watering of cows that has been offered to the dairyman in many years.

The Louden Bowl can be easily and quickly sterilized. It takes but a moment to raise the nose piece to a vertical position, lift up the bowl and slip it off—no rusty set screws to unloosen, no supporting levers to release, no collar connections or other trouble-making attachments to tinker with. No wrench or tools of any kind required. Yet it is an impossibility for the cow to budge the bowl, so rigidly is it held in place.

Increases Milk Yield—Reduces Labor



Milk is made up of about 87% water. The more water the cow drinks the more milk she will give. The average cow must have 10 gallons per day to keep up her milk yield. The Louden Bowl makes it possible for the cow to have a drink of pure, fresh, even-tempered water any minute of the day or night she wants it. Supply valve operates automatically—water stops flowing the instant the cow stops drinking—absolutely no waste.

Easily Installed in Any Barn —no expert help needed. Increased milk yield of cows, and daily labor saved, pay for the Louden Bowls many times over every year.

Illustrated Catalog Sent Free on Request, gives full information on our complete line which includes stalls and stanchions, feed and litter carriers, hay tools, animal pens, barn and garage door hangers, etc. "Everything for the Barn." *Write for it.*

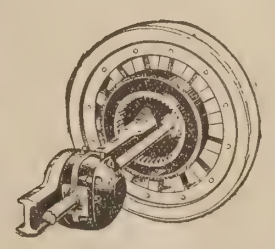
Haul your milk and cream to the best market



A Republic Motor Truck makes it possible for you to deliver whatever you have to sell to the *best* market.

You are not limited to the markets which lie within a six or seven mile radius of your farm. Many dairy-men are hauling their milk and cream with Republics, twenty miles and even further. They go where they can get the best prices and make the trip quickly and economically.

Republic Motor Trucks will make money for any farmer if given the opportunity. They combine every feature necessary or desirable for farm use.

The Internal Gear Drive delivers more power than any other form of drive. It permits the use of a separate load carrying axle of solid forged steel—the lightest and strongest axle known to engineers. It gives 45% greater road clearance, preventing stalling in mud or snow. There is less unsprung weight which means big savings in gasoline, tires and all upkeep expense.

The Internal Gear Drive delivers 92% of the motor power to the wheels. We know of no other drive that delivers as much.

Republic Trucks are easy-riding and easy to drive and care for. And there are seven models from ¾ ton to 5 ton capacity so that you can select just the truck needed on *your* farm.

Republic Trucks are built by the largest manufacturers of motor trucks in the world who build nothing but trucks and know just what is required for every kind of hauling. Last year more than twice as many Republics were produced and sold as any other make.

More than 1300 Republic Service Stations, distributed all over the United States, insure prompt efficient service no matter where you may be located.

See the nearest Republic dealer and write us for latest booklet.

Government Urges Young Men to Continue School Work

The Secretary of War has issued a bulletin urging young men who have a high school education or its equivalent to continue their education in higher institutions of learning for the purpose of preparing themselves for special services in the army, like aviation, artillery, engineering, gas defense, and for appointment to officers' training camps.

There is a shortage of men with the necessary preparation for these specialized services and the preliminary training needed for an officer. The government recognizes the seriousness of the situation and urges all men of suitable preparation to continue their education under the following plan.

At each college and university enrolling one hundred able-bodied students over the age of eighteen and under twenty-one, a military training unit will be created. The instruction will be given by officers and non-commissioned officers of the army. Enlistments in the unit will be voluntary. Students over eighteen but not yet twenty-one will be encouraged to enlist. Those under eighteen will be encouraged to enroll in the training unit.

Students who reach the draft age during any school year will not be called until June 30th following. The enlisted men will be on furlough status until called, will receive no pay or allowance except when attending summer training camp in which case they will receive transportation and rations.

Enlistment in the training unit will constitute an enlistment in the army of the United States. The members of the unit will not be called to the colors until they reach the age of twenty-one unless urgent military necessity compels an earlier call.

The plan outlined by the War Department is strongly supported by the Secretary of the Navy, the Secretary of Agriculture, the Secretary of Labor, the Secretary of the Interior, and the Commissioner of Education.

It is the settled policy of the government to advise young men under twenty-one who have the necessary preliminary education to continue their education at higher institutions, to enlist in the training units, and to prepare themselves for specialized military service, as by so doing they will render their government the greatest possible service.

It has been definitely decided to establish such a corps at the University of Wisconsin and undoubtedly similar units will be established at other colleges in the state. At the State University there will be special courses in infantry, artillery, engineering, wireless and the fundamentals of aeronautics. This course will be in charge of army officers and members of the faculty who have been taking special instruction at Fort Sheridan and other training camps.

Military work for the enlisted men will require about ten hours a week throughout the college year; six out-of-door drill, four regular class room instruction. The remainder of the time will be given to the usual academic courses. In addition there will be a summer camp of six weeks which all members of the training unit will be required to attend.

This is an important ruling of the federal authorities. It should be given wide publicity. Young men of suitable training should be advised that they can enlist in the army and at the same time continue their education and fit themselves for the higher military positions. By so doing they will be offering themselves to their country and be preparing to render services of exceptional value as soon as needed.

The State Council of Defense, re-

ılizing the importance of this deci-
ion of the War Department, urges
ou to give the widest publicity possi-
le to the end that parents, guardians,
nd the young men themselves may
now of it in time and make their
lans accordingly. The information
hould be put in the hands of every
esident of your county.

J. B. BORDEN, Executive Sec.,
Wisconsin Council of Defense.

Middle West Ayrshire Sale

In the past few years a number of
ublic auctions have taken place in
ıe East, offering Ayrshire cattle of
ıe very highest order, and in all
ases the Ayrshire public backed the
onsignors most encouragingly.

Now the Middle West is to have her
pportunity, for on Wednesday, Oc-
ber 2, 1918, there will be sold at the
airy Cattle Congress, Waterloo, Ia.,
collection of sixty Ayrshires, the like
f which has never been offered out-
de of the East. The consignors are
lacing their faith in the Ayrshire
eeders of the Middle West. They be-
eve they want topnotch Ayrshires.

Mr. Wm. Hunter, America's big-
est Ayrshire importer, is sending
ine head from his recent importa-
on. Mr. Hunter imports only the
ery choicest animals. His consign-
ent consists of five heifers due with
ıeir first calves in October, an 18-
onth-old bull, and three cows. These
ne animals will cause a sensation
hen seen,—for they are nine perfect
ecimens. From all reports his con-
gnment to this sale will cause a
ramble among the buyers for their
ssession. Mr. James Van Etta has
nsigned his sixteen finest animals,
cluding the great bull, Bargenoch
ay Cavalier's Rising Star. Mr.
ephen Bull, owner of Aldebaran
arms, is sending four great cows
ıd two yearling heifers, all of which
e very valuable animals. He is
rting with them only because he is
big enough Ayrshire enthusiast to
ant to see this sale composed en-
ely of topnotchers. Among his of-
ring is the cow, Henderson's Laurie,
e greatest daughter of White Cloud
Hickory Island 10377. The Eva-
ere Farm, Ohio, has consigned 12
ad of fine foundation stock, all of
eir consignment being strong ani-
ıls backed with A. R. records. Mr.
B. Bazik of Wisconsin is consign-
g ten head, selected from his herd
100. He is one of the breeders who
s been quietly building up and is
w ready to offer the public some
eal stuff".

Ohio. D. M. HENDERSON.

Abortion

ast fall we bought a cow and she aborted
7 months. I took a sample of her blood to
college and she reacted to the test. We
fed her but it was too late. Nine of our
s have now aborted in rapid succession.
luded in this number is a cow that gives
ween 15,000 and 20,000 lbs. of milk nor-
ly. What would you advise? We have 43
e-bred females. We are in such quarters it
mpossible to isolate them. Is it possible
practical to clean it out without having a
ırate barn, or would you advise marketing
bunch? They represent 7 years of breed-
and are a good bunch of cows and heifers.
andall, Ia. E. M. E.

We should advise you to retain all
's and heifers that are well grad-
up and profitable producers. The
ase in time will be likely to die out
you cleanse, disinfect, and white-
sh the stable and have the cows
perly disinfected by a qualified vet-
ıarian. Then use a disinfecting
ıtion on the floors and in the gut-
s at least twice a week. Syringe
the vagina of each cow and heifer
ry other day for two or three
ks before breeding, using luke-
m water containing thirty grains
ermanganate of potash to the gal-
or other disinfectant preferred by
veterinarian. So far as possible,
o the unbred heifers away from
cows and breed them to a different

THE BADGER LINE of FARM FEEDS

THE FEEDS WITH A HOMINY FEED BASE

FIVE famous Badger Feeds, each made from approved formulas, the result of years of careful feeding tests by practical feeders.

And the base of each Badger Feed is ***Badger Hominy Feed, the most nutritious single feed stuff known.***

Badger Hominy Feed needs no introduction. It has been known and used for many years by the most successful feeders in the country. It is a carbohydrate feed that can be used for all live stock—no other feed stuff will take its place.

Badger Hominy Feed is superior in feeding value to the natural grain because it contains a larger percentage of tissue building material than the whole corn and in the process of milling is partially cooked which makes it more digestible. In it is also included the mill run of Corn Germ Meal—the germ or fatty part of the corn from which the oil has been partially extracted. This makes Badger a far more valuable feed than any other ordinary hominy feed on the market.

Valuable as Badger Hominy Feed is as a base, it is too rich to be used economically alone except in a very few cases.

To secure the correct proportions of proteins, fats and carbohydrates, Badger Hominy Feed should be combined with various other feed stuffs.

But in these times of extreme labor shortage, successful feeders cannot take the time to mix their own feed. They know also that the feeds they mix themselves cannot be as scientifically accurate and dependable as feeds that are prepared under tested and approved formulas and are chemically correct.

The proteins, fats and carbohydrates contained in different feedstuffs differ not only in quantity but in quality. Each Badger Feed contains a different combination of ingredients so proportioned as to make it exactly the right feed for its special purpose.

Badger Feeds are proved money makers, to which thousands of feeders will testify. They will cover the needs of every class of stock on your farm. You will find them absolutely reliable, splendidly adapted to their specific purposes and unvarying in quality.

Get your supply of Badger Feeds now. See your dealer at once. Send for free samples and literature covering Badger Cream City Dairy Feed, Krause Dairy Feed, Badger Calf Meal, Badger Hog Feed and Badger Stock Feed.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Why Keep Herd Records

Why keep a record of what your father's cows are doing? Why is it important to know exactly how much they are producing and what their feed costs? Certainly there is one big reason that you will all think of at once. Are those cows all paying at least a reasonable profit or are two or three actually being kept at a loss? You can't guess at that sort of thing. The looks of the cow is not always a

A 30-day milk record sheet should be found in every dairy barn. Milk scales should be conveniently near and both used regularly. Every junior can see to this much.

sure indication. The only certain way is to keep accurate records and find out.

That one reason for keeping records is plain enough to any fellow who knows anything about dairy cows at all. It's the most important reason and perhaps it is reason enough, but it isn't the only one.

If your father is a really successful dairyman, he is improving his herd year by year, culling out the poorest cows and adding better ones. The records point out the poor cows as well as the good ones. Furthermore, since the most common way of improving a herd is to save the good heifer calves from the best cows, the herd records help with that too.

Nor is that all. Perhaps your father has some good grades in his herd. If he has, buyers have undoubtedly tried to buy some of them. Many of these buyers want to know how much a cow has produced before they buy her. Naturally they'll pay a better price for good producers than for other ones. There again those herd records prove profitable.

Still another point. How much grain do the cows get? Do you simply guess at how much to give each one? If you do you're undoubtedly wasting grain or else not feeding enough for most profitable production. Probably you're doing both. Feed each cow grain in proportion to her production. One pound of grain to every 3 or 4 pounds of milk is about right. You can't do this accurately unless you know how many pounds of milk a day each cow is producing.

And the best part of it all is that it really is not difficult to keep these records, nor does it take much time. Any boy of 12 or 14 can do it easily. Tack the milk record sheet up on an inside wall of the barn where it will be most convenient. Hang the milk scale near at hand and when you finish milking each cow, weigh the milk and put the weight down in the right square. A little addition at the end of every month does the rest. Testing is a little more trouble but this only needs to be done once a month. If you weigh the feed occasionally, say once in two weeks, you can tell about how much is used and figure out what it is worth. All it amounts to is a practical problem in arithmetic.

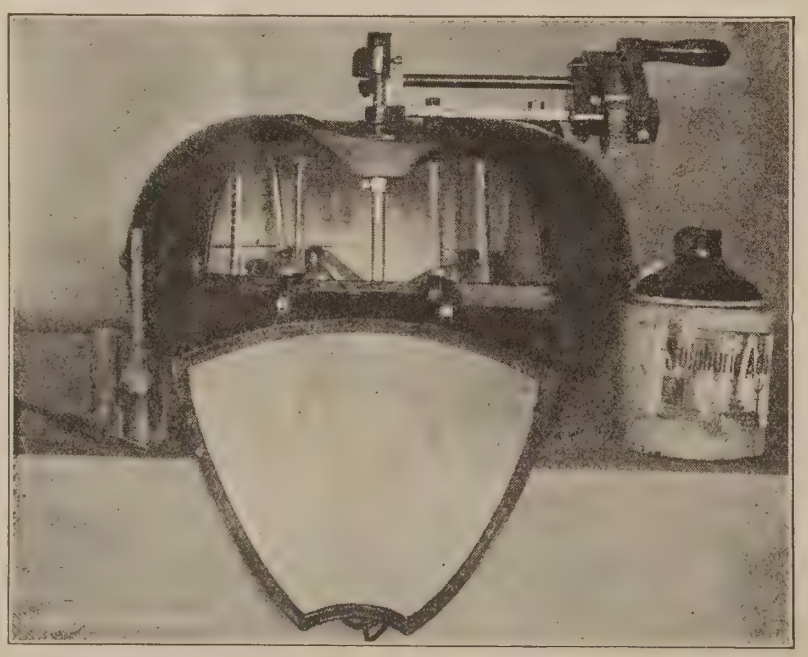
A Club for Your School

Why not have a real dairymen's club at your school this winter? You can't? Oh, yes you can if you're any kind of a hustler at all. How many pupils are there at your school between 10 and 16 years old? Five? Ten? Fourteen? There are enough for a good club anyway and besides there are perhaps several other fellows between those ages, not in school, that you will want in your club.

What kind of a dairymen's club do you mean? A milk record club. You know or should know that keeping milk and butterfat records is an exceedingly important part of the dairy business. If you don't know it or don't believe it, ask any one who has kept such records for a year or two and they will tell you it's not only important but necessary. You can do this work as easily as your father can, easier in fact, because he has so many other things to look after, and you'll find that it will be enjoyable work, too, if a whole club of fellows are doing it together.

How much will it cost to start such a club? It will not, or at least should not, cost you much of anything, not even much time or trouble. The only equipment you need to start with is a milk record sheet and milk scale for each member, and cows to be milked regularly. The first you can make for yourself using a large sheet of fairly stiff paper and a ruler, or you can buy them for a few cents. The second should be found in every dairy barn and if your father does not have one he needs it right away. If you can't get one, an accurate spring balance, such as your mother sometimes uses in the kitchen, can be used. The third will surely cause no trouble at all.

Now then, the next thing is to get this club started. Five or six of the fellows, maybe more, have to help with the milking anyway and you certainly ought to get them interested in keeping track of just how much milk each of their cows gives to see whether they do better or worse than the cows you milk. Get as many interested as you can, the more there are, the more interesting the work will be.



Is agriculture taught at your school? If it is, so much the better. Your teacher will be glad to help you get the club under way, and to answer difficult questions that may come up. He'll help you get or make the necessary milk sheets and later will, no doubt, arrange for testing the milk.

Once you get the fellows interested, have a meeting of all prospective club members, after school perhaps or at some other convenient time. At this time the work of the club must be explained fully, officers elected, and a club name selected. Further, decide on how many cows the records are to be kept, and for how long. As a rule, two, three, or four cows are enough because at least part of your members won't be milking more than that number regularly. The records should be kept for several months at least or better still for the entire school year.

Arrange to have regular club meetings where the work can be discussed and questions answered.

In this connection there is a good chance to learn something about feeding cows, too. Each fellow will be anxious to have his cows do a little better than the other fellow's which means he may have to improve the ration he is feeding. A good many of the unprofitable cows, and there are plenty of them in every community, would come nearer to paying a profit and perhaps actually prove profitable if they were properly fed, so you see that end of your club work will be an important one.

So far, we have spoken only of keeping milk records but to get the most out of this work, records of both milk and butterfat production should be kept. Whether or not it will be possible to keep butterfat records depends upon whether there is a Babcock test outfit that can be used. If there is one at school, you can use that. Or possibly some dairyman in the neighborhood has one he will be willing to let you use. If you can get one, by all means do so, but in any event keep a record of the milk produced.

A BABCOCK TEST OUTFIT WILL ENABLE YOU TO KEEP COMPLETE BUTTERFAT RECORDS

We have suggested a milk record club for your school this winter because we believe that you juniors who really want to learn to be business farmers will find it an interesting way of learning one of the important parts of the dairy business, something that too many of our present dairymen forget about. You fellows have to be more than juniors now. It's up to you to do all that you possibly can to take the places of your older brothers who have gone across. You want that dairy herd you're helping to take care of to be just as productive a herd as any in your section,—yes, and just a little more so, too. There is no way in which you can accomplish more with so little effort than by keeping milk and butterfat records.

We have not given you a list of directions to follow in organizing such a club because we believe you're enterprising enough to work them out for yourselves. Organize your club the way you and the other members want it. If you get stuck on some troublesome question, go to your teacher, he'll be more than glad to help you.

The main thing is to get it started this fall.

Junior Letters

Hoard's Dairyman Juniors:—I would like to become a junior. I read the junior letters every week and enjoy them very much. I am eight years old. I am in the third grade.

We have five cows. They are all Jerseys. I have a Jersey calf. She is a year old now.

My school started August 5th. We have a nice teacher.

We have 20 head of sheep and 22 head of hogs. We have 100 hens and about 200 young chickens and forty-one turkeys. I have a brother four years old and two sisters. One is seventeen and one fifteen. They are both going to high school this year. My brother has a little calf. We have a car, also two horses and two mules. We did not have a calf club at our school or a pig club. We live six miles from town.

As my letter is getting long I will close.

California. Nina Van Pelt.

Hoard's Dairyman Juniors:—I have been very busy. We have been peddling potatoes. I have made $17 so far. My brother and I took up some old iron and got $2.70 apiece. We are making about $100 a month off our cows. We have weaned all of our calves. We have sold all of them except the six best ones.

It looks rainy now. Our crops are not very good. We have our rye cut now and a little wheat, oats, and barley. My brother helps me take care of my potatoes. My young chickens are doing fine. They are worth 60 cents apiece here. I would like to have some of the juniors write to me. My address is Logan, N. D. My brother and I may go after a little puppy after dinner. I would like to see my letter in print.

North Dakota. Fremont Cook.

Hoard's Dairyman Juniors:—I am sorry that I haven't written before this time. I have been working out for about three months this summer. Most of our crops are looking fine now. Some of our neighbors got hailed out this summer. Our wheat died out this spring. We are going to plow our ground this fall. For the last three or four years we haven't had enough snow to keep the wheat alive.

I have one brother in the training camp. I wish that I could go to the camp, but I am not old enough. If this war keeps on one more year I will be 18 years old. Then I will enlist in the army. I hope the Americans will win this war before then. I don't see why the Germans treat the American prisoners like they do. I think it is because they are losing out in this war and another thing is because they

haven't any heart. It will all come back to them some day.

We are milking two cows now. One of our milch cows died about three months ago. She was sick about two months. We will have three milch cows next year if nothing happens to them. I think that I will close for this time, wishing all the juniors good luck. I would like to hear from some of the juniors. My address is R. F. D. A., Box 20, Miles, New Mexico. John W. Lemon.

Hoard's Dairyman Juniors:—I will answer the letter I received from you. I would have written before now but I have been breaking some stubble.

My cotton is going to be ready to pick right away. I'll have from four to five bales to stalk.

We need a rain. Corn and everything is burning up. I went to the pasture and got my heifer. She is looking good.

I will tell you how much grain we made. We had about 100 acres in grain and we made about 5,000 bushels of oats and we have 60 acres of corn and about 70 acres of cotton, renters and all.

I would like to hear from the juniors and will answer all. I am trying to help the government a little by buying one five-dollar stamp a month. I am going to buy one today. Texas. Garner George.

Hoard's Dairyman Juniors:—This is my second letter to the juniors. We have just finished harvesting and we soon will start to stack.

I have seven little pigs now and I am going to try to have them fit to sell by the first of January. We are going to build a new silo, and then we will have two. I think ensilage is a good feed for cattle.

I read Hoard's Dairyman every week and I think it is one of the best dairy papers you can read and I have seen a good many.

I have 28 little chickens and I am going to have about that many more. They are R. I. Reds and they are good layers. I also have a pure-bred Holstein calf I bought from papa for $125. I think it is a good one.

I am going to raise rabbits and I would like to hear from someone who has some rabbits to sell. My address is Medford, Minn., R. F. D. No. 2. Arthur J. Brady.

Hoard's Dairyman Juniors:—It has been a long time since I wrote. I have one more chicken that goes out in the pasture with the cows and catches grasshoppers. There are plenty of them.

We only had 17 acres of wheat, but we got 390 bushels and the 20 acres of oats made 560 bushels. We got $2.08 for wheat. We filled our cow barn with clover hay. We are not going to cut it any more. We are going to pasture it. I think we'll fill our silo to the top. Twenty acres of our corn is good. There are ears big enough to eat. The rest isn't very good.

Our sow had a litter of eleven pigs, two runts died. They are growing fine. We sold two fat ones for $100.50.

We are milking about thirty gallons a day. I do not milk as I have to work in the field until they're done.

If it doesn't rain we will not make anything with corn.

We are going to plow for wheat as soon as it rains. The ground is as hard as a brick. It has been a month since it rained.

I will close wishing the juniors good luck. My address is Brazil, Ind. Jesse Casassa.

Hoard's Dairyman Juniors:—It has been a long time since I wrote you my last letter, but you must excuse me as I have been very busy working in the dairy. As I had a little spare time, I thought I would write you and let you know that I am still alive. We have about six hundred and fifty quarts of milk to bottle every morning and about three hundred at night. I usually do the separating. We have a No. 25 separator.

The potato crop around this part of the country has been practically a failure, but the corn looks fine. We expect to fill the silo the middle of next month.

We have seventeen pigs, eleven of which are young ones.

We are now milking twenty-six cows and getting about five and a half cans a day.

I have to go for ice every afternoon with my uncle.

Our corn is fine but our potatoes are very poor. The corn is beginning to curl a little for the want of rain. We haven't had a drop of rain for over three weeks and the ground is as dry as a bone.

Well, as it is time to get to work, I will close.

New Jersey. Lewis L. Baldwin.

Hoard's Dairyman Juniors:—Hello, boys. Thought it was time I was writing to the juniors. I had almost forgotten that I was a junior.

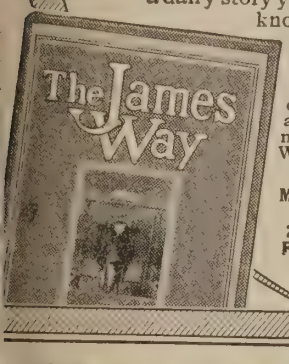
Our peas are growing fine. They are almost ripe and then we will have another job on hand. Most all the people around here are raising peas, but they are cutting them for hay because little green lice crawl underneath the leaves and kill the plants. We have had pretty good luck with our crop because there are not very many lice on our plants.

We have all our hay hauled in except about an acre of clover. It is raining rather hard today so we can't work outside.

We feed our calves calf meal and bloat mixed with water.

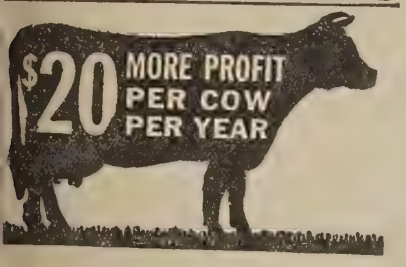
I expect to go to high school at Nooksack, which is about a mile and a quarter from our place, but it don't begin till October. I think I will buy a bicycle so I can ride to school on it.

Wishing all the juniors good luck, I will close.



Washington. Bert Brune.

The Way to Bigger Dairy Profits



IT shows how to select the right location, tells about drainage, light, ventilation and distance from other buildings. How to build best for the small herd so you can properly enlarge later. It shows

JAMES
Sanitary Barn Equipment

which is used in many of the most profitable barns in the country. James equipment keeps the cows comfortable—makes them bigger producers, increases your profits. The JAMES BOOK has a dairy story you want to know. Will be mailed if you just tell us when you expect to build or remodel and for how many cows. Write today.

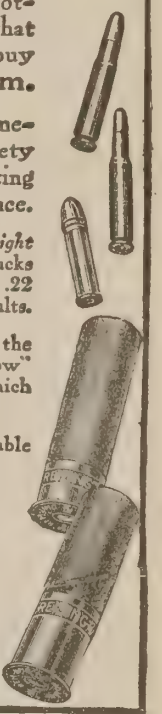
Repeating Shotguns and Rifles
for Shooting Right

WHETHER .22 repeater for the boy or autoloading shotgun for yourself, a high power autoloading rifle for that well earned deer hunt or a pump gun or rifle for general use, buy a Remington UMC and know you are getting the *right* arm.



Every Remington UMC shotgun or rifle is *right* in every mechanical detail—hammerless, with solid breech, has positive safety lock and either autoloading or slide action. And *right* in shooting qualities, balance, fit, material, workmanship, finish and appearance.

Buy Remington UMC Shotshells or Metallic Cartridges and add the *right* finishing touch. For example, for squirrels, woodchucks and other small animals, the Remington UMC .22 cartridge with hollow point bullet gives best results.

The wonderful Wetproof process used exclusively in the manufacture of Remington UMC Smokeless "Arrow" and "Nitro Club" Shotshells, produces a shell which can be exposed to wet for hours without harm.

In *black powder* shotshells, buy the old reliable Remington UMC "New Club," now wetproof sealed at turnover (crimp) and top wad.

Two reliable young Hollanders, one married and one single, want positions on a dairy farm, on shares preferred. State all details in first letter. Address BEN VISSCHER, 2093 W. High St., Racine, Wis.

Limiting Cream Stations

HOARD'S DAIRYMAN:—Your recent article on limiting cream stations interests me very much and I ask for a brief space in which to express the thoughts and ideas of one who is only a stockholder in a farmers' co-operative creamery company.

There is no need to recite the difficulties and discouragements met by the real progressive men who organize a farmers' co-operative creamery company. After their time and energy have been spent in placing the business on a paying basis, along comes the cream budging station with its magnificent promises and away goes the "slacker" and the one who has been and will be the "Doubting Thomas" from the beginning to the end of time.

Now you admit the cream station could be eliminated as a war time measure in towns where creameries exist, but you fear there might be no one capable of deciding which station can best comply with certain sanitary conditions and observe rules and regulations to be complied with. Now we believe the farmer should be allowed his full freedom and that inalienable right which is his heritage.

If he has not enough intelligence to ship his own cream to his chosen centralizer, then and then only does he need a cream buying station.

Wisconsin. J. A. BOYER.

Number of Bull Associations Grows

Farmers are taking advantage of the opportunity to use pure-bred bulls which is afforded them by membership in a co-operative bull association. Eight is the net increase of co-operative bull associations for the year ended June 30, 1918, and eight others are now in process of organization, according to the Dairy Division of the United States Department of Agriculture. On July 1 this year 43 associations were in operation, as compared to 36 on July 1, 1917, one association in operation last year being disorganized. Fieldmen, county agents, and others working in co-operation with the department have had a part in establishing these associations. There is an average of 5 pure-bred bulls in each organization and an average of 225 dairy cows.

Dairy Cattle Congress

The ninth annual Dairy Cattle Congress will be held September 30th to October 6th, 1918, in its permanent home at Waterloo, Ia. This is the great yearly event of the dairy industry in the middle western states and the 1918 show promises, like each of its predecessors, to surpass every previous show as a comprehensive exponent of the great industry it represents.

The industrial world is facing gigantic problems different from any it has solved heretofore. These problems necessitate greater activity, more strenuous effort, and the necessity for greater achievement. People are asked to conserve along all possible lines and at the same time increase production. Events such as the Dairy Cattle Congress are for the purpose of encouraging both conservation and production and have not only the sanction but the hearty recommendation of the government.

From the standpoint of the visitor, the Cattle Congress is of twofold importance. In the first place, it brings him face to face with the latest achievements along manufacturing lines. It shows him what the manufacturing world offers in the way of labor saving machinery, and those conveniences which are fast taking the drudgery out of every phase of farming. Farther than this, one of the most difficult problems the farmer is called upon to solve today is that of help. How is he going to get his work done with labor conditions as they are? He cannot do more himself, yet the incessant call is for more production along every line. How is he going to meet it? The answer is, labor saving machinery, and here is where he may post himself on the latest things along these lines.

In the second place, the programs which form a most important feature of the Cattle Congress bring together the best authorities on subjects that are of vital importance to the men who believe in keeping thoroughly posted and up-to-date in their business. Dairying is a business just as much as merchandising or manufacturing. It is one of the most important lines of activity in touch with human life. This has been brought out with decided emphasis during the recent investigations that have been made along the lines of the foods that are best adapted to the nourishment of the human race.

Iowa. E. S. ESTEL, Sec'y.

A Better Way of Sealing Preserves, etc.

In putting up preserves, catsups, chow-chow, chili-sauce, berries, Indian Relish, etc., don't follow the troublesome paraffine wax method of closure.

The better and easier way is to use a MIDGET CROWNER and seal your bottles (up to 14 ins. in height and 4 ins. in diameter) with air tight Crowns (3 sizes).

In storing condiments of all kinds for future use you will find this the safest method of sealing.

Write for full particulars.

Wisconsin College of Agriculture to Instruct Men in Students' Army Training Corps

Arrangements have been made by which a large part of the energy of the Wisconsin College of Agriculture will be devoted to instruction of men in the Students' Army Training Corps.

Students desiring to enroll in the College of Agriculture, in addition to the military drill which prepares them especially for service in the active field branches such as the artillery and infantry, will be given an opportunity to secure educational training in:

1. Special courses in agriculture having military significance.
2. A considerable portion of the required work for the Long and Middle Courses in Agriculture.
3. Fundamental work in science and other liberal arts.

This enables the student-soldier to get the ground work of his education while at the same time training for early military service is secured.

The government desires especially that young men get all of the general education possible before going into camp, for the demand for officers to handle the proposed army will be heavy and students with college training will have a better opportunity to enter officers' training camps or non-commissioned officers' schools.

VETERINARIANS AND STOCKMEN.—With the drafting of horses and mules by the thousand, comes the problem of their selection, their care, and management. The artillery and cavalry services and the remount stations desire men who can detect unsoundness, who can select the best horseflesh. The horses in the field need care when sick or wounded. The feed must be fed right. The horses must be driven and handled scientifically. Stock judging develops powers of judgment, decision, and observation. Men skilled in handling stock will find their duty an important one.

ENGINEERS.—The part played by the engineer in the war is an important one. The tank has been developed from the farm tractor. Concrete work, the drainage of trenches and camps, gas engine repair and management, the handling of tractors, mapping, drawing, surveying—these and many other courses can be offered in the college.

GARDENING.—At every cantonment here and in France the army does its best to help feed itself. War gardens, hundreds of acres in size, have to be planted, cared for, and harvested to supply vegetables to help keep the men fit.

PIGEONS AND POULTRY.—The Signal Service is training carrier pigeons with success for intelligence purposes. The war department has detailed an officer and squad to carry on experiments on night flying work with our experimental flocks. Poultry husbandry is of service at base quarters in providing fresh supplies for hospitals and utilization of camp wastes.

BACTERIOLOGISTS.—From the sanitary corps and from the hospital units comes the call for men trained in bacteriology. Fundamental training in the protection against disease and insanitary surroundings forms an important part of the war machine.

CHEMISTS.—The Chemical Service requires the aid and assistance of men having experience in handling and mixing chemicals. The Sanitary Service needs chemists expert in water analysis, in nutrition, and other lines. The field of explosives offers fascinating work. Still other chemists are making tests in aeroplane production, the treatment of timber for trench, railroad, and other forms of war use.

A. W. HOPKINS.
Wisconsin College of Agriculture.

Western New York

HOARD'S DAIRYMAN:—The dairy situation in western New York is undergoing some change, but on the whole it appears to be gaining on the other agricultural industries. Certain farmers are saying that they have made money from their cows lately for about the first time and they are prepared to carry more of them in the future. They say that though the necessity of being at home at about the same time every morning and evening to milk the cows is somewhat taxing, the work is by no means as hard as ordinary field work and they are willing to endure it so long as it is sure to bring profit. It need not be said here that in some cases the profit has come more from better methods of handling the cows than formerly, but that is not all of it.

Lately the automobile has come in as a factor in farm life and it seems to have helped the dairy farmer more than any other, unless it may be the truck raiser. The automobile means a quick trip to town with milk or cream and a whole day's work on the farm at the same time. Besides, it means that the farmer who has to milk a dozen cows can make a long trip if he pleases after milking time, or he can come home from a point a dozen miles away and take care of the milking without wasting much time. Then if he wants to go out again he can do so without much loss of time. A certain farmer, for instance, one day lately, went out with his automobile four times, always on business, such as going to mill and to the railroad, drove over forty miles, and did a fair day's work on the farm at the same time. With a horse this would have taken the whole day and it would have required a relay of horses then, if loads had been at all heavy. When the automobile tractor arrives, as it bids likely to do soon, the advantage will be still further increased.

There is now a new development in some districts in the form of a milk trade that is destined to eat into the cream trade unless the creameries bid up for the cream. The big demand for milk, the slow movement of the railroads, and the added independence of the farmer in these days of food shortages have pushed up the farm price of milk and now there is a move to pay six cents for milk at the farm and save the farmer the time of delivering it at the railroad. The price is said to be much better than the price paid for cream and it is going to create a diversion in that direction. The automobile truck will do the carrying.

At the same time, the careful farmer is sorry that he feels obliged to accept any plan that takes his milk off the farm. It starves his pigs and calves. As it is now, with a separator, all such animals thrive. The skimmilk is fed to them still warm and they grow as no other feed will make them, unless it be whole milk itself. To sell the milk is to deprive the farm of this big help. Some farmers are planning to save out the milk of a cow or two and with it try to keep up the pig and calf industry, but it will not be easy. Part of the little herds will have to go anyhow and the separator may have to be laid aside altogether.

New York. J. W. CHAMBERLIN.

Stabilizing Cottonseed Meal

In spite of the lower yield of cotton and the increased cost of production, the organized cottonseed producers have agreed with the Food Administration to stabilize the price of cottonseed at the average price of last year. This is a concession on their part to the cattle feeding and dairy interests in this country. The prices will vary from $64 to $72 per ton in carload lots, f. o. b., cars, depending upon the yield in oil.

Differentials have been fixed for crushing seed on the basis of last year's cost and regulated profit of last year, plus the increased cost imposed by change in labor, transportation, and supplies. As a result the price of meal is about $3 per ton higher than last year.—FOOD ADMINISTRATION.

A rainy day job: Make a hanging shelf and a screened cupboard for the cellar. Your wife will appreciate them.

Lookout Farm Jerseys

Our Present Offering Affords an Unusual Opportunity to secure a Fine Foundation For a Productive Herd and comprises

A young bull, solid color, and ready for service. There is not a weak line in his pedigree. His sire carries 37½ per cent of the blood of Hood Farm Torono, the great sire of high producers; the sire's dam is an 11,000-lb cow; and on the bottom line of the bull's pedigree there is an **unbroken line of Register of Merit cows for five generations. Five heifers** dropped respectively Feb. 23, '17; Feb. 26th, '17; Apr. 5th, '17; Sept. 21st, '17; and Oct. 24th, 1917. All are sired by Lookout Prince, 115074, whose first daughters to freshen are now under test and are "making good". Three of the five are out of Register of Merit dams; and all five have R. of M. backing; are finely bred for production and are good individuals.

or if interested in a bull calf send for our bull calf list. **Woodlawn Farm, Sterling, Illinois.**

CLEVELAND HERD

Offers Two Holstein Bull Calves

nine months old, good straight individuals, well grown. One is out of a 29.08-lb. 3-year-old, next dam a 26.10-lb. cow and the other out of a 20.33-lb. Jr. 2-year-old daughter of a 29-lb. cow. Both calves are sired by our K. V. P. Alcartra whose eight nearest dams average 30.52 lbs. butter from 611 lbs. milk. Also a few young A. R. O. cows bred to this bull and sired by King Segis Pontiac Veeman, one of the greatest sires of prize winning daughters in the world. If interested send for pedigrees, pictures and prices.

H. R. WEISKOPF, CLEVELAND, WIS.

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam is a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a finer combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.

We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.

This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

Buffalo Creek Farm

OFFERS A SON OF

Prince Hengerveld Fayne No. 77461

A 33-lb. son of King Fayne Segis. Dam's record is 18 lbs. as a 2-year-old and 24 lbs. as a 3-year-old, with a semi-official record of 13,471 lbs. of milk and 520 lbs. of butter. Pedigree and price on request. **Albert R. T. Lillie, Supt., Arlington Heights, Illinois.**

The Fifteenth Sale of

Registered Holstein-Friesian Cattle

—BY THE—

Pure-bred Live Stock Sales Company

Tuesday and Wednesday, Oct. 1 and 2

at Brattleboro, Vermont

and will consist of 150 HEAD OF CHOICE CATTLE of all ages and both sexes from the herds of well-known breeders. Send for Catalog.

Purebred HOLSTEINS

"Both milk and fat are produced at lowest rate in general by the cows consuming the most food." This conclusion is reached by Prof. H. H. Wing, Professor of dairy husbandry at Cornell, after a year's observation of the University experiment station's herd.

Holsteins are large and healthy, capable of converting large quantities of coarse feed into the best of milk suitable for all purposes.

If you are keeping cows for profit, investigate the large Black and White Holsteins.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Susquehanna Farms, Hartwick Seminary, N. Y.

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.

River Meadow Farms, Portlandville, N. Y.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY

YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A. 398-408 Columbus Ave., New York City. Reference—Colonial Bank.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

Address The Purebred Live Stock Sales Company.

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Walcowis Farms

OFFER SON OF

IOWANA SIR OLLIE

BULLS IN SERVICE

Woodcroft Perfection No. 199441, who has a 40-lb. dam made from over 700 lbs. milk and over 1000 lbs. butter in one year, average for 2 nearest dams 38 lbs. Pabst Blackberry Korn. No. 186830. Dam's record, 31 lbs. at 3½ yrs. sired by a 38-lb. bull **Maplecrest King DeKol 2nd.** A 26-lb. grandson of King Pontiac Champion. Young bulls for sale. Dam's record 16 lbs. at 23 mos. to 31 lbs.
Muckleston, Howell & Schwartz, Waukesha, Wis.

We Offer a Son of Pabst Pontiac Champion No. 105106

from a granddaughter of Homestead Jr. DeKol. Ready for service. Faultless individual. Priced to sell quick. Dam has good 7-day and yearly record as a 4-year-old. She has 1 A. R. O. Son and 2 A. R. O. daughters.
S. A. BAIRD & SON, Waukesha, Wis.

KING SUPERBA

King Superba's Dam is the great Milanhurst America De Kol, World's Record 4-year-old, with 1231 lbs. butter in 365 days, and 28 lbs. butter nine months after calving. Eight of her records have never been equaled in all respects by any other cow. Come and see his sons and daughters at the Wisconsin State Fair, Sept. 9th to 14th. (See W. J. Mann & Sons ad.)
BAIRD BROTHERS, Waukesha, Wis.

FINE BULL CALF

We offer a bull calf born Nov. 19th, 1917. A very fine, straight, growthy individual ¾ white; dam has 7-day A. R. O. of 24.6 lbs. butter and 567 lbs. milk. He is by a sire whose two nearest dams average 22.3 lbs. butter and 520 lbs. milk at 3 years. Price $125.00 if taken at once.
Miller Bros., R. No. 25, Oconomowoc, Wis.

RUST BROS., WEST ALLIS

Size, good individuality and large 7-day and semi-official yearly records are the points for which our herd is noted. The following are two of our records: Aaltje Salo Netherland Pontiac has 33.3 lbs. in 7 days and 134.8 lbs. in 30 da. Ida Lotta 5th 29.74 lbs. in 7 days at 4½ yrs., 27.12 lbs. in 7 days and 816.9 in 365 days at three yrs. We now have a couple serviceable young bulls from A. R. O. dams for sale.
RUST BROTHERS, West Allis, Wis.

GRAMLING BROS.
Dousman, Wis.

KING SUPERBA

Meet his sons and daughters on exhibition in the Waukesha County Live Stock Exhibit, at the Wisconsin State Fair. Combine individuality with production. For Sale—Sons of King out of our best cows. (See Baird Bros. ad.)
W. J. Mann & Sons, R. 2, B. 16, Waukesha, Wis.

MORE MILK—MORE MONEY

Get a grandson of this great cow, Milanhurst America DeKol, 143441, that produced an 8-gallon can and a ½ of milk per day equal to 13 tons, or more than her own weight each month for a whole year. If her milk was sold at 10c a quart her years production would amount to $1,300. A few choice bulls for sale, some of breeding age.
Dr. David Roberts Stock Farm, Waukesha, Wis.

BELLEVIEW STOCK FARM

Breeds the big, high producing kind. We are now offering for sale a few good sons and daughters of Aaltje Salo Johanna Pontiac 57169.
E. B. WATROUS, - Troy Center, Wis.

We Offer Three Young Bulls

4 mos. of age sired by Sir Pietertje Ormsby Mercedes 43d whose dam and sire are among the greatest of the breed. They are out of high producing A. R. O. dams. Send for photo and pedigree. Herd on U. S. Accredited List. We will price these bulls cheap because they are young. A good chance for your next year's sire.

Breeders, not dealers.
Elm Leaf Stock Farm, Bear Creek, Waupaca County, Wis.
Jas. McKone, Prop. Wm. Lucia, Manager.

YOUNG BULL FOR SALE

I am now offering an excellent young bull dropped February 27.

His Sire: A son of King Segis Pontiac Polkadot, that has 100% the same breeding as K. S. P. Alcartra, and from one of the good daughters of Korndyke Wayne Paul De Kol. **His Dam:** Rosa Queen Herbert De Kol, a 22.5 lb. junior, 4-year-old. This calf is well grown and a remarkably fine individual.

A few other bulls up to 11 months old, and several females for sale. Every animal guaranteed.
HALSEY SEDGWICK, Limeridge, Wis.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.
Highland View Place, - Whitewater, Wis.

Do You Need a Young Bull?

Mutual Fobes Longfield DeKol, 82959

One of His Good Young Sons for Sale

Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters although a comparatively young sire. His sire is one of the good sons of Mooie Mutual DeKol. His dam, a daughter of Homestead Jr. DeKol (71 A. R. O. daughters), made 30.04 lbs. butter and 630.80 lbs. milk in 7 days as a Jr. 3-yr.-old. At the same age she made 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days.—(A world's record when made.)

The Dam Of This Young Bull is Monona Josephine with 31.77 lbs. butter and 616.2 lbs. milk in 7 days. She is a granddaughter of Homestead Hengerveld DeKol and Dutchland Sir Pontiac Rag Apple (29 A. R. O. daughters). The first of her daughters to be tested made 22.82 lbs. as a jr. 2-yr.-old in the month of June. Two of her sons are in service at the head of first class herds.

The Calf Himself was born March 11, '18. He's nearly half white and a good individual, one of the kind that will develop into a big, straight, rugged herd sire. Moreover, he's bred right. Notice the milk production on both sides of his pedigree.

We Have other young bulls for sale. Write today or come and see us.

MILFORD MEADOWS STOCK FARM, Lake Mills, Wis.

HOLSTEINS Registered and Grade Holsteins of all ages and both sexes for sale. Can furnish several car-loads of excellent females due to freshen this fall; ready for immediate shipment. Several bulls ready for service.

GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go. **EDGEWATER STOCK FARM, Fort Atkinson, Wis.**

FOR SALE

Entire Grade Herd

CONSISTING OF

75 Holstein Cows
75 Guernsey Cows

On account of labor shortage we have decided to dispose of all our grades, which are the cream of this herd and are the best that can be had. We will continue in the dairy business with our herd of pure-bred Guernseys.

DON'T STOP TO WRITE—COME AND SEE THEM.

McCanna's Edgewood Stock Farms

A Complete Dispersion

of the Avoca Lodge Farm Herd

120 Registered Holsteins to Be Sold

October 9th and 10th, 1918

8 Miles Southwest of Denver, Colo.

Korndyke Pietertje Colantha 96261.

Korndyke Pietertje Colantha, our senior herd sire, will be sold. He is the only son of Pontiac Korndyke having for his dam the only cow that ever produced a 30-lb. daughter at 24 months of age. She was the first cow that ever produced two 30-lb. heifers. He has 7 sisters with records from 37 to 47 lbs., and 10 A. R. O. daughters with records up to 24½ lbs. all made as 2 and 3-year-olds.

The only bull in the world backed by such a combination of breeding and production.

Orchard Grove Rag Apple, a son of Rag Apple Korndyke, is our Jr. herd sire.

In the Show Ring.—We showed the Grand Champion bull at the 1916 Colorado State Fair and the 1918 Western National. Our aged herd and get of sire groups were undefeated the past 2 seasons. We have won over twice as much prize money at the shows where we have exhibited the past 3 years than have any of our competitors.

We have fifteen daughters of Buffalo Dirkie Johanna, our $10,000 bull who was a son of "Johanna Colantha's Lad" and Oakhurst Duchess Clothilde, the dam of Duchess Skylark Ormsby.

We have cows that have milked 112 lbs. in a day, 22,000 lbs. in ten months and 43,000 lbs. in 21 months with butter records over 29 lbs. in seven days and 126 lbs. in 30 days, made under ordinary conditions in our dairy barn.

We have 50 granddaughters of Pontiac Korndyke and King of the Pontiacs. We have 30 cows and heifers that weigh from 1,600 to 2,000 lbs.

Catalogues will be ready on Sept. 15th. Write

Donley & Simpson, Props. P. O. Mt. Morrison, Colo.

G. M. Banks, H. E. Buchanan, Auctioneers.

Need a Herd Sire?

We Are Offering One of His Sons, a Real One, From a 27-lb. Dam.

His Sire is Iowana Sir Ollie, shown above, a son of Canary Paul Fobes Homestead, he a 34.96-lb. son of Canary Paul. Iowana Sir Ollie is from Ollie Watson Prima Donna, 3 times an Ass'n prize winner with 31.10 lbs. butter and 618.7 lbs. milk in 7 days to her credit. More than that he is a wonderful individual, a bull that would show to advantage in any ring today.

The Dam of this young bull is Groveland Korndyke Cornucopia, 27.71 lbs. butter and 624 lbs. milk in 7 days. She is a daughter of Cornucopia Pontiac Johanna Lad, one of the good sons of King of the Pontiacs, and from an A. R. O. granddaughter of Sir Korndyke Manor DeKol (45 A. R. O. daughters, 3 above 30 lbs.).

This Young bull was born April 8, '18. He's well marked, about half white, and a fine individual,—a bull that really will make you an excellent herd sire. Finally, he's priced to sell.

Remember we stand back of every animal we sell. Write today for picture, pedigree and price.

NATHAN DICKINSON & SON, Lake Geneva, Wis.

A. R. O. Holstein

In order to make room in our barns we must sell a number of cows and heifers that are backed by large official milk and butter records. They are bred to **WISCONSIN STAR STOCK FARMS,**

Cows and Heifers

our great herd sire, King Korndyke Veeman, whose two nearest dams average over 37 lbs. butter in 7 days. Write for particulars or come to **ED. M. SCHULTZ, Hartford, Wis**

A Few Good Ones For Sale

I am offering yearling and bred two-year old registered heifers for sale. Daughters of King Segis Pontiac Polkadot 8th, he a grandson of King Segis Pontiac and from one of the good daughters of Johanna McKinley Segis. A number of these heifers are bred to Sir Aaltje Pontiac Hengerveld, a 33.68-lb. son of Hengerveld DeKol Beets. Also several good young bulls from A. R. O. dams and a few cows in calf to the 33-lb. bull. Write me or come and see them for yourself.

J. D. McDONALD, WEST SALEM, WISCONSIN.

A Bull That Will Suit You

He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, and whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna De Kol. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show cow,—took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is backed by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been looking for. Other young bulls by the same sire and from A. R. O. dams for sale. Write

WAYSIDE STOCK FARMS, A. L. Williams, Est., C. A. Williams, Exec. Fond du Lac, Wisconsin.

Young Bulls From Seven-Day and Yearly Record Dams

Dams of all bulls have official records of from 15 to 25 pounds of butter. All are now on yearly semi-official test and will complete records this fall and winter. Nearly every cow has completed cow testing records for three years and has produced up to 600 pounds of butter. These cows are never pushed to the limit. The bulls offered are sired by bulls secured from the E. C. Schroeder and other noted herds. Sires' dams have records up to 950 pounds of butter. Bulls are heavy bone, straight, well marked and large for their age. They will and must please. We guarantee satisfaction.

Otter Tail County Holstein Breeders' Association, J. V. Bopp, Fergus Falls, Minn.

The Greatest Bull on Earth

SIR ORMSBY SKYLARK

He Sired the Champion Record Cow of the World Duchess Skylark Ormsby.

Sons of Sir Ormsby Skylark from high testing dams for sale. Will also sell my four-year-o d junior herd sire, 35-lb. son of Johanna McKinley Segis and Pearl Ormsby Burke.

MAXWELL FARMS, WATERLOO, IOWA.

From a Yearly Record Dam

A handsome son of King Korndyke Sadie Vale 24th, four-fifths white, born November, 1917. His dam has following records: Butter, 365 days at 2 yrs., 644 lbs.; milk, 13,860 lbs. (8th Ass'n prize in class). Butter, 7 days at 6 yrs., 26.12 lbs.; 30 days, 98.54 lbs. Dam's dam, a 22-lb. cow with 641 lbs. 365 days. He is bred right. Write for his photo and pedigree today.

W. B. BARNEY & SONS, CHAPIN, IOWA.

WRITE FOR CATALOG SERVICE BULLS

Bulls by 2400-lb. proven sires from large yearly and seven day record dams. One from a world's record dam in yearly division. Breeding, size, individuality and price that will meet your requirements. Also offer a few A. R. O. cows. Visit Rival Stock Farm or write.

No other herd has as many large yearly records now being made.

No other herd has two herd sires with as large yearly record backing. How would you like to own a herd bull with such breeding? We can furnish you this kind. Write

Hargrove & Arnold Holstein Co., Norwalk, Ia.

VERY HIGHLY BRED YOUNG

Holstein-Friesian BULLS

and two heifer calves are offered for sale cheap. All are registered, tuberculin tested and sound. Write or see **"LIVE FAIR" VIEW, Waverly, Iowa. Otto Bradenberg, Mgr.**

Look Ahead a Few Months

When the snow is knee deep on the ground and the mercury drops way down below zero, that's the time when feed will be as scarce as hens' teeth and next to impossible to get, yet that is just the time when you will need a good supply of feed on hand for your dairy cattle, cows, hogs and horses.

Look back over the conditions last winter when the railroads were blocked and many sections were on the verge of a feed famine (undoubtedly yours one of them), then put yourself on the safe side for this winter. Make your "fore-sight" as good as your "hind-sight" and when the snow flies in a month or two, you will be better off in milk production, in dollars and cents, and in satisfaction.

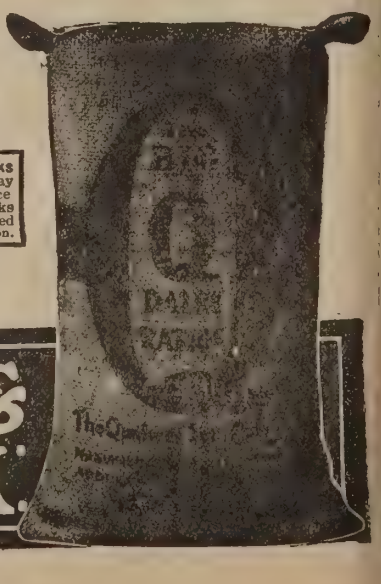
Order Your Fall and Winter Feed Supply Now

It is also equally important that you order the kind of feed that will give you BEST FEEDING RESULTS AT THE LOWEST COST.

Make the major portion of your feed order SCHUMACHER and you will have no regrets, because it most satisfactorily supplies the needs of not only dairy cows, but of all other farm animals as well.

SCHUMACHER FEED fed as the base of the dairy ration with high protein concentrates has more World's Records to its credit for big milk and butter production than any other feed.

BIG "Q" DAIRY RATION is a high quality protein feed and when fed in connection with SCHUMACHER you can balance your ration to suit the individual need of every cow in your herd so as to assure maximum production and good physical condition all year 'round.



SCHUMACHER is also an ideal feed for young stock. It develops hogs faster and cheaper than corn and is a safe, palatable, easily digested ration for horses.

Place your feed order at once with your dealer. He can supply you now—later on he may not be able to. Make your order read enough SCHUMACHER and BIG "Q" for your dairy stock and enough more SCHUMACHER for young stock, hogs and horses, then you'll have a feed supply that can't be beat for all farm animals.

MEET US AT THE NATIONAL DAIRY SHOW, COLUMBUS, OHIO, OCTOBER 10TH TO 19TH. OUR EXHIBIT WILL BE OF SPECIAL INTEREST TO DAIRYMEN AND BREEDERS

15c apiece for Jute Sacks Your dealer will pay you 15 cents apiece for empty jute sacks of our brands returned to him in good condition.

The Quaker Oats Company Address, Chicago, U. S. A.

SCHUMACHER FEED & BIG "Q" DAIRY RATION

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI — FORT ATKINSON, WIS., OCTOBER 4, 1918. — Number 11

THE COW AND MACHINE MILKING

C. LARSEN, South Dakota State College of Agriculture.

THERE has been much discussion, pro and con, relative to the practicability of the milking machines on the dairy farm. Some will claim they are practical, others say they are not. This variation in opinion undoubtedly is due to the manner in which different people have succeeded in operating milking machines.

I personally know of one man who purchased a milking machine for milking a herd of unimproved cows. He used it but a short time. This machine was sold to another man and he succeeded. I know of another man, a breeder of pure-bred dairy cattle, who purchased and installed a milking machine. The herdsman used it a few months and then concluded that he would rather milk by hand. This particular machine was sold to another man, also a breeder of pure-bred dairy cattle, and he was successful in operating it.

Why this difference? It could not have been in the machine because when the milking machines changed hands they worked successfully. The difference was undoubtedly in the cows and in the operator.

In our experiments with the several types of milking machines, (B. L. K., Empire, Sharples, Hinman, Waterloo Boy, Calf-Way, Perfection, and Universal) we have found that the cow and the operator are very important factors in determining the practicability of the milking machine on the average dairy farm. My personal belief is that where any of the standard milking machines have been pronounced failures, the difficulties can be traced chiefly to the cows or to the operator. The operator acts as does a governor on an engine. He co-ordinates the machine to the work that is being done.

It is impossible for a person to harmonize the machine and its work unless he knows what kind of work the machine has to do. The operator must understand that extraction is not all there is to milking. There are three processes that must function together harmoniously.

Milk Secretion

First, the secretion of the milk. This occurs within the mammary gland. It is in progress all of the time. It is a natural function, and an involuntary act, and cannot be controlled by the cow and the milking machine operator. However, this secretion of milk is closely connected with the nervous system of the cow. Through the nervous system both the cow and the milking machine operator may affect, though not control, the secretion of the milk.

If the cow is frightened or made uneasy by the machine, or is made nervous in any way, the secretion of the milk does not proceed normally. Probably an occasional or temporary abnormal secretion of the milk will not seriously affect the cow and the work of the machine, but should this provocation continue, the production of the cow and the success of the mechanical milker would without doubt be hindered.

THESE COWS HAVE BEEN MILKED BY MACHINE FOR SEVERAL YEARS, WHICH IS PROBABLY THE BEST EVIDENCE AS TO THE PRACTICABILITY OF MACHINE MILKING

To secure the largest measure of success, as with any mechanical contrivance, the cow, the operator, and the machine must establish the right kind of co-operation, as is so well discussed by Professor Larsen in the accompanying article.

Second, the release of the milk. This is a very important part for the user of the milking machine to understand. The flow of the milk from the upper part of the udder to the lower part is controlled by the cow. The manufacture or secretion of the milk occurs in the mammary gland, chiefly in the upper part of the cow's udder. The cistern, or the milk reservoir, is in the lower part of the cow's udder, or just above each teat. These extreme upper and lower parts of the cow's udder are connected by means of a complex system of tubes and vacuoles. These serve to conduct and store the milk within the cow's udder. These milk ducts branch and rebranch. The opening and closing of these tubes or ducts are controlled by most cows.

If the milking machine in any way produces discomfort to the cow, she is likely to hold up her milk. A cow having a very distended udder, or giving a very large flow of milk, is not likely to do this, but if the discomfort of the machine is greater to the cow than the discomfort of retaining the milk, then the cow is likely to hold up her milk entirely, or to give down the milk little by little. This will either cause much stripping by hand or, if this stripping is not drawn, it will tend to dry up the cow early, and it may even cause diseased udders.

Milk Extraction

Third, the extraction of the milk from the cow. Aside from the small amount of milk (about one pint) stored in the milk cistern, the machine cannot extract the remainder of the milk without the aid of the cow. Some have used the milking machine as though milking was only a question of extraction. If this were the only point to consider, the milking machine would be almost perfect. This use of milking machines has in a measure given the public the impression that the extraction of the milk is all there is to the successful operation of a mechanical milker. The range of mechanical adaptability of the milking machines for extracting milk from different cows is certainly great. The cow is a living individual; the milking machine cannot be attached and milk drawn as though she were some inanimate object.

The general principles of milking described above apply to all cows, but individual cows differ. At the beginning of the lactation period cows are more nearly alike. The farther the herd of cows advances in the milking period, the greater the characteristics and peculiarities as to manner of milking will appear. It is these individualities that the milking machine operator should endeavor to learn, to make the milking machine do good work in the herd throughout the year, and one year after another.

Know Each Cow's Peculiarity

The operator should see that the teat cups properly fit the cow. Some of the machines have the universal teat cup. This cup has a wide range

Northwest Canada Butter Scores High

HOARD'S DAIRYMAN:—Manitoba butter made by J. Donald of the Russell Creamery won first honors in the dairy section of the Toronto Industrial Exhibition just past, with a score of 98.16, out of a possible 100, with every province in the dominion competing. Seven Manitoba creameries won thirteen prizes, the silver cup for the best butter on exhibition and two specials. Following are the classes in which they won prizes and the scores made:

	Score
56-lb. Box Salted Butter	
6th prize—Crescent Creamery	96.49
5th prize—Russell Creamery	96.55
7th prize—Shoal Lake Creamery	96.16
56-lb. Box Unsalted Butter	
4th prize—W. Weir, Winnipeg	96.82
6th prize—Russell Creamery	95.76
7th prize—Shoal Lake Creamery	95.69
40 Lbs. Creamery Prints	
1st prize—Russell Creamery	98.16
3rd prize—Shoal Lake Creamery	97.50
5th prize—Belmont Creamery	
6th prize—Shoal Lake Creamery	
56-lb. Box June Make	
2nd prize—Russell Creamery	96.72
7th prize—Shoal Lake Creamery	96.16

Alberta also made a good showing, P. Palleson, Calgary, winning one special and first for the 56-pound box of unsalted butter with a score of 97.39. Edmonton City Dairy third in the same class with a score of 96.99. In the class for creamery prints, Palleson of Calgary was second, and the Edmonton City Dairy fourth. In the class for 56-pound boxes of salted butter, Palleson was second with a score of 96.99.

In the class for boxes of 56 pounds made in June last, Edmonton City Dairy was first; Donald of Russell, Man., was second; A. Severson of Calgary, third; Palleson of Calgary, fourth; and after them came in Pictou County, Nova Scotia; Eugene Fauscher of Quebec; and the Ontario Agricultural College.

Illinois. G. LEININGER.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Letters Home

SOMEWHERE IN FRANCE.

DEAR MOTHER:—Yesterday we went into action and had five hours of steady fighting. How is Brown Betty, that cow Dad gave me? Our guns opened up on the Huns and we had them running like so many frightened geese. Is the calf all right and is she turning out the way I thought she would? But they sure feed us fine and we get three squares a day, fight or no fight. Making as much cottage cheese as ever, Ma? I think Gen. Pershing is great. All the boys love him. Did Pa get that new auto delivery truck he was wanting to take milk to market? Lots of love,

BILLY.

P. S. How many Holsteins have you now? The Germans have started shelling our trenches. Give my regards to the big bull.

Philosophy of the Oldest Dairyman

"More and more, stockmen are encouraging individuality in cows. It'll be so, finally, that an animal will be ashamed to not show a profit at the end of each year."

"A friend of mine has a Holstein and calls her Aggie Violet Evangelina Hermon Gladice, and, in spite of that handicap, she is a prize winner."

"In a recent cow testing meet out my way, eighty per cent were Holsteins and a quiet little Jersey went away with the honors, claiming as a record 530 lbs. of fat during the association year. If cows was women, wow, what jealousy there'd be!"

Cruelty to Animals

The little city girl had watched work in the dairy. She saw a mechanical milker in actual operation. Running, wild-eyed, to her mother, she exclaimed:

"Oh, Mumsie, they won't even let the poor cows rest after they've come home. Now they have them hitched up to big machines and are making them supply the power. Or, maybe, they are being tested to see if their hearts are all right!

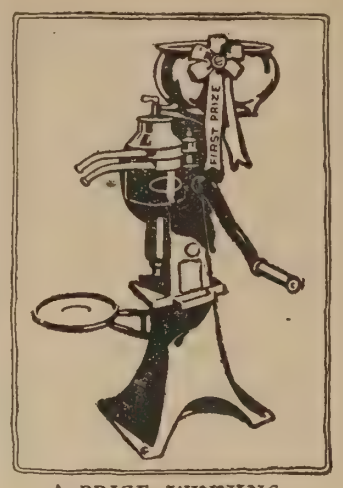
"I'm powerful fond of fresh veal," said Uncle Abner Hostetter of Fairview Dairy, "especially when they serve apple sass on the side, but I can't help thinkin' how nice an' purty it looked when it was cuddled up close ter its mother."

Look at it any way you please, it's th' cows that are really buying them bonds."

Conserving Gasoline

(In a great many sections, the driving of pleasure cars on the Sabbath is prohibited, as a war-time measure. We wish to submit a list of essential exceptions to the general rule, for use on farms.)

That once-a-week visit to your best girl, thirty miles away.



When Doug Fairbanks happens to play on a Sunday, at the movies.

Going to town for the Sunday papers to see how the war progresses.

Running over to convince a stubborn neighbor that he ought to buy more bonds.

To take a party of eleven visitors back to the railway depot, after they have been on the farm for a month.

All Fords looked upon as beasts of burden.

A PRIZE WINNING CREAM SEPARATOR

THE

DE LAVAL

CREAM SEPARATOR

Is a Winner!

Why don't you let it win for you?

AT the great national and international expositions, the juries have invariably acknowledged the superiority of the De Laval. They awarded the Grand Prize, the highest possible award, to the De Laval at the Panama-Pacific Exposition at San Francisco in 1915, as also at Buffalo, Chicago, St. Louis, Paris, Brussels, and all the great world expositions for more than 35 years.

What the world's greatest dairy experts, the men who operate the creameries and the big milk plants and dairies, think of the De Laval is best evidenced by the fact that 98% of the cream separators in use in such plants the world over are of De Laval make.

De Laval Produced Cream Makes the Best Butter

Since 1892 the National Buttermakers' Association has held butter-scoring contests each year in connection with its Annual Convention, and at every such Convention butter made from cream separated by a De Laval Separator has scored highest. This is a 100% record for the De Laval. No room for chance there. Only unusual merit made such a record possible.

Proof of the superiority of De Laval Separators and of De Laval produced cream has been piled up and multiplied so many times that it is no longer questioned. It is an accepted fact.

If you are without a cream separator, or in need of a better one, let the De Laval start winning a bigger cream profit for you NOW.

A PRIZE WINNING PRODUCT

See your De Laval agent immediately, or if you don't know him, address the nearest De Laval main office as below for any desired particulars.

The De Laval Separator Company

De Laval Bids You Welcome

The Indiana State Fair

C. R. GEORGE, INDIANA

THE 1918 Indiana State Fair was distinctly a fair for Hoosier farmers. More so than ever before the real farmer breeders of the state brought the best of their production to the fair and to be "Hoosier Made" have an added prestige to any exhibit. This new trend of things more than pleased the "men at the barns". They not only liked the idea of "an Indiana fair for Indiana farmers" but they appreciated the opportunity to meet their fellow breeders, to see their herds, and to match the good things of their own breeding against those resulting from the other fellow's skill and judgment. And when the Hoosier farmers came in to visit the fair during the week they took the idea. Many complimentary remarks about the county breeders' exhibits to be seen in the horse, cattle, and hog barns and about the large number of state breeders in contrast to previous years, when the "rich men's herds" from other states had dominated the barns and the show ring, could be overheard whenever one chanced upon a group of farmers who could appreciate the significance of these changes in the character of the exhibits.

"True it is", said one man in discussing this situation, "that the exhibits are not as uniformly good and high in quality this year as on some previous occasions when the ponderous drafters from France and Belgium and England reigned supreme in the horse barns and when the herds owned by wealthy "agriculturists" who could buy up the best show animals in the country and blend them into a show herd, were the chief places of attraction in the cattle, sheep, and hog barns". "But," continued this man, "the breeder who showed his stock for the first time this year has learned a big lesson about selecting his animals and selecting those of uniform type to make up the best herds and this same man will come back next year with a well fitted herd that will be a real credit to his name and to the quality of the herd that he has developed."

Interest in Labor Saving Machinery

One very hopeful observation, in view of the labor situation which our farmers must face next year, was the great interest taken in any exhibit which featured labor saving devices. The milking machine, the tractor, and other farm equipments that will reduce the man labor requirements could always be found in the center of a crowd of interested farmers and their wives and they were there not in curiosity as so often happened in previous years but to learn of and see the "pros and cons" of the different makes in order that they might buy more intelligently these implements that must quite largely take the place of the "Hired Man" and the "Boy".

Purdue Exhibit

The agricultural exhibits from Purdue University, which are prepared by the various divisions of the Agricultural Extension Department and staged in the Purdue building, had an increased significance this year in view of the wartime demand for increased production. The crops man featured an appeal for the increased wheat acreage that we must sow. He connected our stocks of wheat with the dreams of our soldier boys in France by means of a huge rainbow. Truly this is the "Pot of Gold" of which they dream and we must work and plan that this as well as other of their dreams may come true. The beef man featured the results of feeding experiments at Purdue to show how more beef can be produced with less feed, and the poultry man applied the "work or fight" ruling to poultrydom by featuring the need of culling out the non-producing hens from Indiana flocks. In this way each department told its story in such a way that the passerby could not but get the idea. And when he stepped into the room devoted to dairying it was all "bull". "Buy better bulls to increase the production of our dairy herds" first greeted their eyes and furnished the theme of this year's dairy exhibit. There they were—four bulls—two from Henry County Jersey Bull Association and two from the Fountain County Guernsey Bull Association to illustrate the principle and the practicability of the "bull association" idea. It was explained that the four bulls purchased by the Henry County Association were paid for by an assessment of $4.25 per cow which is certainly an economical way to provide for bull service when it is considered that these bulls are all out of high producing cows—over 500 lbs. of butterfat—and that barring accident they can be used for six or eight years.

In a similar way it was shown that the four good bulls in Fountain County had replaced 10 inferior bulls that were in service before the association was organized. The detailed pedigree of one of these bulls, Fontaine's Tormentor, showing the large production records of his ancestors, was worked out on a large scale. Nearby the production of his dam was compared with the production of the average dairy cow in Indiana. This was featured with tubs of butter and certainly the contrast was great enough to convince the most skeptical that a bull out of such a cow would be a powerful influence for the increased production of our dairy herds.

Dairy Products Exhibit

The dairy products exhibits at this year's fair were the best that have been held in the state for many years. The State Dairy Association interested the producers of milk and cream to exhibit in these classes and the State Buttermakers' Association got behind the butter exhibit and added special premiums in the form of an Indiana Buttermakers' Special. As a result the number of entries was good and the quality of the products was much above normal in all classes. The awards in the milk, cream, and butter classes were as follows:

Market milk, unpasteurized, exhibited by producer—1, P. H. Crane & Bro.; 2, C. A. Richards; 3, Mrs. J.

(Continued on page 322)

BEECHER WYTHE 2ND, GRAND CHAMPION HOLSTEIN COW AT THE INDIANA STATE FAIR

She is 14 years old, is the original foundation cow of Mr. Seberger's herd, has given birth to 12 heifer calves, and has produced approximately 90 tons of milk. She was formerly champion production cow of the state and is the dam of a state champion.

The New York State Fair

H. H. LYON, NEW YORK

NEW YORK is called the Empire State, and in many respects deserves the title. For eight or ten years the New York State Fair has grown in importance and attractiveness. New buildings are erected each year and of a permanent character. Daily addresses are now a feature of the fair, besides many educational lectures. This year war interests took over a substantial portion of the preparations, and it was expected that the war would tend to diminish attendance. Possibly it did, but the attendance this year surpassed early in the week that of a year ago. Bad weather cut attendance later. Secretary McAdoo's train passed the grounds on the first day and was halted for the secretary to look out upon the fair grounds and receive the welcome of those present. It was at this time that the soldiers' and sailors' memorial arch was dedicated with several companies of soldiers present, and with Frederick P. Keppel, assistant secretary of war, as chief speaker.

Prominent Visitors

The fair was attended by notables, among these being Governor Whitman, who has been re-nominated, and by his opponent, Mr. Smith, both being from New York City, and very amateur in farm understanding. John Mitchell, State Food Commissioner, paid his respects to the fair and, in spite of illness, gave a short address. He urged conservation of food. Mr. Mitchell, although originally a coal miner, has won the respect of farmers, and, as a labor organizer, he urges organization and co-operation among farmers. He predicts that the strife between labor and capital will be seen to pass into oblivion. The object is now to produce as much as possible in all lines, to assist in bringing the war to a successful close.

The Dairy Building

New management was found necessary in the dairy building this year as the veteran overseer, George A. Smith, could not serve. George Hoague, now of the Department of Farms and Markets, took it over with several of the former assistants. A somewhat new feature was the manufacture and sale of products. Butter, cottage cheese, and ice cream were made and sold. Some 5,000 10-cent dishes of ice cream of superior quality were made and sold long before the fair closed, and the amount might have been doubled had there been help to handle it. A person sees the product made, then wants some of it. Prime goods of this sort help to advertise, and that is what is needed. Whey punch from the whey of the cheese was also made and sold and created interest.

In another booth Professor Way and his workers were engaged in demonstrating various tests. The apparatus has been displayed before but here we had the things in operation. The Babcock test, the moisture test for butter and cheese, and the salt test to determine the quantity of salt in butter were in operation, enlisting much attention. In addition the new Mojonnier tester for determining fat percentages was employed. This is a rapid method for more accurate work. The outfit costs about a thousand dollars, and its operation requires a special man at around ninety dollars a month, but in some of the large condensing and evaporating establishments and ice cream factories it is found very profitable to install the outfit on account of its accuracy and rapid work. Several moving and advertising machines were at work, and one legend I will quote: "The farmer who is using oleomargarine is greasing his path to the poorhouse."

Conferences Held

A number of conferences were held during the week of the fair. One of these was between representatives of the State Food Commission and some sixty feed manufacturers of the country. The State Department of Farms and Markets, the Dairymen's League, and several organizations sent representatives. It is said, just as farmers have been contending for a long time, that many inferior substances are substituted for sound grains in the feeds put upon the market. The commission objects to this, at least, unless the tag announces the ingredients used. The feed men insisted that they would be driven off the market if this rule is enforced. It would seem to a farmer that they ought to be if their mixtures will not stand this test. As Dr. Porter remarked, there ought to be co-operation in these war times between the feed dealers and manufacturers and the farmers of the state

OWNED BY BORDEN'S FARM PRODUCTS CO., NEW YORK

WEATHERCUP'S GOLDEN LAD, GRAND CHAMPION JERSEY BULL AT THE NEW YORK STATE FAIR
OWNED BY C. I. HUDSON, NEW YORK

The Food Commission placed on exhibition samples of materials from which feeds are manufactured. In one glass case were clean materials such as gluten, hominy, oil meal, cottonseed meal, and several feeds, all free from hulls and other objectionable materials. In other cases were placed the materials of which other feeds are compounded, or "compounded feeds" as Dr. Jordan calls them sometimes. These were samples of buckwheat shucks, peanut hulls, cocoanut shells, oat clippings, mill sweepings, oat straw, and a sort of earth labeled humus. This is a remarkable showing, and something of the sort ought to be shown at League meetings and all gatherings of dairy farmers throughout the state. Many of these feeds are abominable. Dr. Porter said to the writer that as a director in the Federal Administration, a member in the Food Commission and commissioner in the State Department of Farms and Markets, he proposes to do all he can to put a stop to the sale of such feeds in the state

Milking Machines

Milking machines are more and more in evidence year by year, and each time there is an exhibition new makes put in an appearance. These days of labor shortage increase the demand for them. It is not surprising therefore that the state experiment station is devoting considerable time to the handling of these machines. Dr. Breed, chief bacteriologist at the station, tells me that city boards of health are rather inclined to discourage the machines. This is because health boards are making bacterial tests and they frequently find higher tests

BOGSIDE SPOTTIE 2D, GRAND CHAMPION AYRSHIRE COW AT THE NEW YORK STATE FAIR
OWNED BY IROQUOIS FARM, NEW YORK

OWNED BY KENT BARNEY, NEW YORK

where machines are used. The station has made efforts to ascertain the cause of this, and there seems to be reason for the opinion that higher tests go with careless handling, and that careful, intelligent work with the machine usually obviates this difficulty. Various methods of disinfection have been studied. Chloride of lime disinfects in some ways but after a while it is found that bacteria have entered the rubber tubing and made trouble. This alone is insufficient.

In making inspections it is found that many farmers are immersing the tubes and cups in a receptable where there is running water and with excellent results in some cases. Further investigation shows that this method is efficient only so long as the temperature remains below 60°. Salt brine cleans up the bacteria admirably, and might be of itself sufficient, but health boards seem concerned with numbers of bacteria rather than with kinds. There is a salt bacterium which does not affect milk, but does affect the count, and therefore the brine method alone hardly suffices. The addition of a little chloride of lime appears to destroy the brine bacteria with the result that tubes in the mixture remain sterile.

Big Cheese Exhibit

A state fair here would seem incomplete if there were not the "big cheese" somewhere about, made by H. A. Reese of Lowville. He has been on this job so long, has added equipment year by year until he is prepared at the West Martinsburg creamery for any sort of a stunt in the big cheese line. Not only does Mr. Reese make big cheese but he makes good ones. This fact is attested by the marvelously quick sale of the 6,500-pounder at thirty-five cents a "shy" pound. Nor is this all, for the first five pounds went higher. Lieutenant Governor Schoeneck cut out the first specimen of five pounds and Mr. Soule of Syracuse gingerly carried it off leaving a thousand dollars for it, the money to go to the Red Cross fund. This performance created a lot of enthusiasm and was witnessed by a dense crowd.

Farm Bureau Exhibits

The farm bureaus of the state are many and efficient. For some three years they have presented exhibits, the first year there being but three contesting if I remember correctly. The interest shown has been so great that this year ten prizes were offered. Ontario County took first; Cayuga, second; Madison, third. Then came Wayne, Warsaw, Columbia, Suffolk, Delaware, and Monroe. In several instances, counties are devoted to dairying almost exclusively and these exhibits were in the cattle building. Six counties were thus represented. Here Onondaga County took first on Holsteins, Rensselaer had first on Guernseys, Green came out first with Jerseys, and Otsego with Ayrshires. Two counties only were entitled to compete for the farm bureau sweepstakes on cattle, as these were all that presented three breeds, and here Otsego won the two-hundred-dollar prize. The other prizes were a hundred dollars each.

The department of farm mechanics at the college presented a model miniature ditching machine which was kept in operation by electricity, working in a sandy soil on a table. The best way to provide outlets for drains was also shown with streams of water flowing from them. The idea is first to provide sufficient fall beyond the outlet to present obstruction, and wire screens of wide mesh to prevent entrance of rodents, etc.

One booth was devoted to the production of home grown dairy feeds in New York. Sweet clover received a little attention, but alfalfa was emphasized mostly, and strong emphasis placed on hardy seed. Inoculation is regarded as very important, and the use of lime practically indispensable. In different sections of the state different amounts are advocated, but for the most part heavy applications are desirable, one to two tons, except for a small strip across the state. This was all shown on a map placed above the cards containing recommendations.

New York has given considerable attention to the draft horses for a few years. We purchase vast numbers of these animals from western farmers every year. Efforts have been made to promote draft horse breeding, and the state fair has had a very considerable share in encouraging this industry. The result is that quite a proportion of the draft horse exhibits were this year from this state. Percherons and Suffolks were quite in evidence. The George Urban Milling Company of Buffalo took several prizes, and G. E. Pretteplace of Norwich four-horse team prizes for the less than 6,000-lb. class, with his Suffolks. This size is regarded with favor by interior farmers of the state.

The Cattle Show

D. W. McLauray has been superintendent of the cattle exhibit for several years and he calls this year's exhibition of cattle the largest and best yet held. Practically 900 head of cattle were stalled in the fine and substantial cattle building, some 525 of these being dairy animals. While New York had a lesser area than some of her western competitors, and her farm lands are in many cases offered at ridiculously low prizes considering their productive value, her dairy herds are said to be producing milk to the extent, at farm valuation, of $150,000,000. She is still a great dairy state and her dairy industry naturally was well represented at the fair.

There were about two hundred exhibits of beef cattle. The dairyman is not supposed to linger long with these, but I must say that some of them are attractive. The Shorthorn breed had quite a number of attractions, and there are several pleasant things to say for the milking strain of this breed, even for an occasional farmer in New York State. In this connection I will mention the Brown Swiss, a good dairy animal, and represented by only two herds, there being forty-eight animals shown. These were by Forest Farms of Rochester and Hull Bros. of Ohio. They were the nicest lot yet of the Brown Swiss family that has come to the fair.

Ayrshires were in large numbers, with New York cattle such as those belonging to Kent Barney and Iroquois Farms in fine display. The former secured the champion and grand champion prizes. Among Jersey herds were those of C. I. Hudson and Ogden Mills. L. D. Cowden of Fredonia, as well as several others, had some fine show animals. Guernseys were there to the extent of 138, and A. G. Buckley of Valley Falls and Borden Farms of Richfield Springs had especially valuable animals. The latter got the champion and grand champion prizes.

E. A. Powell sent forty head out of the 178 Holsteins on exhibition. His Annie DeKol Butter Girl, now 13 years old, was placed as the first Advanced Registry cow in New York State. C. L. Amos came within one point with Glista Erica, a 26-pound junior four-year-old. Haeger of Illinois took champion and grand champion.

The U. S. Official Bulletin

Owing to the enormous increase of government war work, the governmental departments at Washington are being flooded with letters of inquiry on every conceivable subject concerning the war, and it has been found a physical impossibility for the clerks, though they number an army in themselves now, to give many of these letters proper attention and reply. There is published daily at Washington, under authority of and by direction of the President, a government newspaper—The Official U. S. Bulletin. This paper prints every day all the more important rulings, decisions, regulations, proclamations, orders, etc., as they are promulgated, by the several departments and the many special committees and agencies now in operation at the National Capital.

This official journal is posted daily in every post office in the United States, more than 56,000 in number, and may also be found on file at all libraries, boards, and chambers of commerce, the offices of mayors, governors, and other officials. By consulting these files most questions will be found readily answered; there will be little necessity for letter writing; the unnecessary congestion of the mails will be appreciably relieved; the railroads will be called upon to move fewer correspondence sacks; and the mass of business that is piling up in the government departments will be eased considerably. Hundreds of clerks, now answering correspondence, will be enabled to give their time to essentially important work, and a fundamentally patriotic service will have been performed by the public.—E. S. ROBERTS, Editor "The Official Bulletin".

COUNTY EXHIBITS OF HOLSTEINS AT NEW YORK STATE FAIR

ONONDAGA COUNTY

STEUBEN COUNTY

A feature of the New York State Fair cattle exhibit is the large number brought out by counties in competition for liberal prizes. Classes are offered for the best exhibits within a breed and a sweepstakes award of $200 is given for the county excelling in an exhibit in which three breeds must be represented. Onondaga County's Holsteins were placed first this year over those of other counties, winning the award of $100. Renssalaer County won first prize on Guernseys, Green County on Jerseys, and Otsego County on Ayrshires. In the sweepstakes class, however, only two counties were eligible since no others were represented by as many as three breeds. Otsego won the $200 prize.

MADISON COUNTY

CHENANGO COUNTY

Modernize Your Dairy

with the

Burrell (B-L-K) Milker

These four features found on no other milking machine make the Burrell the most efficient and most profitable machine on the market.

1. Automatic Controller—This device insures natural and thorough milking. It regulates automatically and provides just the right amount of suction at all times for each individual cow—less force for the easy milking cow and more for the hard milker.
2. Universal Single Compartment Cup—Only one size required for ordinary herds. No rubber lining to contaminate the milk; nothing expensive to wear out. Extremely simple.
3. Positive Suction Trap—A combination of check valve and trap between the milker pail and stanchion line. Absolutely prevents any dirty liquid leaking back into the pail. Reduces the bacteria count.
4. Partition Pail—This feature of our two-cow milker keeps the milk from each cow in a separate section. The only way to keep individual milk records without it is by using single pails, which is both expensive and inconvenient.

Write for our pamphlets, which, describe these modern features fully, and show why great saving results from the use of the Burrell Milker.

Be comfortable

THE nation promotes the comfort of the man who works that he may do more work. Are you so living that you can work and produce as never before?

Do you need a more modern home—a new one or the old remodeled?

Curtis Service and CURTIS Woodwork can help you.

We will send you—free—a book of home plans. Just let us know whether you are interested in houses costing more or less than $3000.

Then go to a lumber dealer selling CURTIS Woodwork. See some of it and look through the big catalog containing every design. Select the woodwork you want—for building or remodeling—from the standard designs shown in that catalog.

Then see to it that the woodwork you get carries this mark—CURTIS. There is no way to get as quick service in woodwork of equal quality for the same money.

The Curtis Companies, Service Bureau
1904-2004 S. Second Street, Clinton, Iowa

The makers of Curtis Woodwork guarantee complete satisfaction to its users. "We're not satisfied unless you are"

Save Fuel!

Fit your home with CURTIS Storm Doors and Sash. They will save fuel for the nation and money for you. Any Curtis dealer will gladly quote you prices.

The Indiana State Fair.

(Continued from page 319)

M. Smock; 4, Gleason. Market cream, unpasteurized, exhibited by producer—1, P. H. Crane & Bro.; 2, Mrs. J. M. Smock; 3, Gleason. Creamery butter—1, Schlosser Bros., Plymouth; 2, Schlosser Bros., Frankfort; 3, Fox River Butter Co., Muncie; 4, Schlosler Bros., Bremen; 5, Warren Creamery Co., Warren.

Exhibits of Dairy Cattle

The exhibit of dairy cattle at this year's fair was above normal in size and in the interest which it created on the part of both exhibitors and visitors. This new interest was largely brought about by a concerted effort on the part of the exhibitors and representatives of the State Dairy Association. Last year there were but very few Indiana bred cattle in the show and the movement to change these conditions was started at that time. A committee was appointed which met with the State Board of Agriculture and worked out a plan of action. A special futurity show for four classes of young stock in each of the Jersey, Guernsey, and Holstein breeds was arranged for and the state breed associations took up the problem of interesting their breeders. It was slow work because showing was new to most of our best breeders and the labor situation made it very difficult to interest them.

But the results of this first year's efforts were more than encouraging. Nine state breeders contested for the futurity ribbons in the Holstein breed and in one of the classes fifteen calves were lined up before the judge. The futurity show in the Guernsey and Jersey breeds was not so strong, the Guernseys being represented by five breeders and the Jerseys with three breeders. However, every breeder who did show was convinced that a strong show by state breeders was what we ought to have and they went back with the determination to interest others and come out strong next year. Each of these futurity shows included four classes, senior calves and junior yearlings, both bulls and heifers. Competition was limited to Indiana breeders and all entries had to be dropped the property of the exhibitors. This year's experience has shown that the junior yearling bull class is not a good one as too many breeders have their bulls sold before they reach that age. Some changes in the classification should be made before next year but the plan is a good one and it should live on.

The awards in the different breeds and classes were as follows:

Holsteins

Exhibitors: S. P. Scherer, C. M. Bottema, Morgan Brothers, Frances Bushore, Chas. Ohlfest, Arthur Hanrahan, M. J. Seberger, Michael Seberger, Sam Woods.

Judge: Professor C. S. Plumb, Ohio.

The showing of black and white cattle was distinctly an Indiana show as all of the nine exhibitors were Indiana breeders. The most interesting feature of the show was the two county exhibits from Lake and Porter counties. Each county sent a carload of their best cattle selected from different herds. It was their initial experience in the show ring and they lacked the finish of well fitted animals. However, the fact that each county carried off one of the grand champion awards as well as many other good premiums speaks for the quality and breeding of their cattle.

The outstanding animal of the show was the grand champion cow, Beecher Wythe 2, owned by M. J. Seberger of Lake County. She is now 14 years old and still a wonderful show cow. She was Mr. Seberger's original foundation cow and during her lifetime has produced 12 heifer calves and approximately 90 tons of milk. A few years ago she held the state champion record for yearly production over all breeds and two of her daughters have broken state records, one of them exceeding the yearly record of the old cow with 24,233.2 lbs. milk and 789.4 lbs. fat.

PINECREST KING FRANCE, GRAND CHAMPION GUERNSEY BULL AT THE ILLINOIS AND INDIANA STATE FAIRS
OWNED BY O. W. LEHMANN, ILLINOIS

The junior and grand champion bull, King Korndyke Isabelle Veeman, is the herd sire from the Morgan Bros.' herd in Porter County. He is an outstanding son of King Korndyke Sadie Vale.

The most interesting class in the entire show was a line-up of fifteen senior heifer calves. They were all bred in Indiana and consequently competed for ribbons in both the open and futurity classes.

The awards in the various classes were as follows:

Bull, three years and over—1, Bottema, on It Mona Pontiac. Bull, 2 years and under 3—1, Morgan on King Korndyke Isabelle Veeman; 2, Bushore on Una Land Korndyke Hengerveld. Senior Bull Calf—1, Scherer on Hoosier Pontiac Gerben; 2, Woods on Wood's May Colantha King Korndyke; 3, Bushore, on Unaland Prince Artis Burke; 4, Morgan on Indiana Peter Alcartra Burke. Junior Bull Calf—1, Bottema on Zelden Rust Zur Pontiac; 2, Scherer on Hoosier

King Segis Pontiac; 3, Michael Seberger on King Colantha Lyons Beryl.

Cow 4 years or over—1, M. J. Seberger on Beecher Wythe 2nd; 2, Morgan on Gold Coin Johanna 2; 3, Scherer on Friend Ivy Aaggie DeKol 3rd; 4, Bottema on Monk Fayne DeKol Ramona Thorne. Cow 3 years and under 4—1, Scherer on Hoosier Beauty Pontiac Korndyke; 2, Scherer on Korndyke Excellence; 3, Ramona Thorne. Cow 3 years and under 4—Heifer 2 years and under three—1, Scherer on Zeldenrust Segis; 2, Scherer on Jeek Queen DeKol May; 3, Bottema on Arbor Lawn Albina Daisy. Senior Yearling Heifer—1, Scherer on Zendenrust Soldene; 2, Hanrahan on Pearl Cornucopia DeKol Lass. Junior yearling heifer—1, Scherer on Hoosier Weitske Pontiac; 2, Scherer on Hoosier Pontiac Sadie; 3, Bottema on Zeldenrust Johanna Segis; 4, Bottema on Zendenrust Grace Segis. Senior Heifer Calf—1, Bottema on Segis Pontiac Calamity; 2, Woods on Wood's King Korndyke Ungulesche; 3, Scherer on Hoosier Roberta Korndyke; 4, Scherer on Hoosier Segis Weitske. Junior heifer calf—1, Bottema on Zeldenrust Princess Segis 2nd; 2, Ohlfest on Cloverleaf Priam DeKol; 3, Scherer on Hoosier DeKol Pontiac; 4, Morgan on Indiana Kate Alcartra Pietertje.

Get of Sire—1 and 2, Scherer; 3, Bottema; 4 Michael Seberger. Produce of cow—1, Scherer on Hoosier Segis Weitske. Junior heifma. Breeder's young herd—1, Bottema; 2, Scherer; 3, Morgan. Breeder's calf herd—1, Bushore; 2, Scherer; 3, Bottema.

Junior and grand champion bull—King Korndyke Isabelle Veeman. Junior champion heifer—Zeldenrust Soldene. Senior and grand champion cow—Beecher Wythe 2nd.

Guernseys

Exhibitors: Robert C. McNagny; P. H. Crane & Bro.; Mervin Eby; O. H. Mills; and L. A. Wood, all of Indiana; O. W. Lehmann, Illinois; Goodhand Kingston & Son, Wisconsin.

Judge: Chas. L. Hill, Wisconsin.

Two herds from outside the state together with representatives from five Indiana herds that were brought in for the futurity show made up the Guernsey show. The five state breeders brought out only eight entries but they won consistently throughout the show. The yearling bull, Hambro, of Lookwell Guernsey Farm, shown by Mervin Eby, won his way to junior championship in the open classes. He is a young bull of great style and finish and is out of the state champion two-year-old Guernsey cow. Another outstanding animal was the junior yearling heifer, Colleen of Killarney Farms, shown by Robert McNagny. She was an easy winner in her class and a strong contender for the junior championship ribbon.

Competition between the herds of Lehmann and Kingston was about evenly divided until it came to the championships when Lehmann forged ahead with his outstanding bull, Pinecrest King France, and his aged cow, Rag Apple, and captured the two grand championships. Considerable interest was manifested in the placing of Lehmann's aged cow, Rag Apple, over Kingston's Imp. Princess Du Braye 2nd. These two cows had been shown together at the Illinois State Fair and Rag Apple was placed down because of her fleshiness and the fact that she was far advanced in lactation. However, Judge Hill preferred this showy cow with extra good lines and a good head to the imported cow with her weaker top line and shallower barrel.

The list of awards were as follows:

Bull, 3 years or over—1, Lehmann on Pinecrest King France; 2, Kingston on Moss Raider of Muskego. Bull 2 years and under 3—1, Kingston on Hopeful of Edgemoor. Bull 1 year and under 2—1, Eby on Hambro of Lookwell Guernsey Farm; 2, Lehmann on Mixter Penrod of Bon Ayre; 3, Crane on Lady Grace's Woodland Boy. Senior Bull Calf—1, Kingston on King Elder Lawn; 2, Kingston on Muskego Princeling; 3, Crane on Rex of Crane Farm; 4, Mills on Woodlawn's Zimeri. Junior Bull Calf—1, Kingston on Muskego Stars and Stripes; 2, Lehmann on King of Chesney Farms; 3, Kingston on Muskego Moss Raider.

Cow, 4 years or over—1, Lehmann on Rag Apple; 2, Kingston on Imp. Princess DuBraye 2nd; 3, Lehmann on Gold Speck. Cow 3 years and under 4—1, Lehmann on Raymond Princess; 2, Kingston on Chywoone Lassie of M. L. Heifer 2 years and under 3—1, Kingston on Trislette's A of Sunny Slope; 2, Lehmann on Lilly Bell of Chesney Farms. Senior Yearling Heifer—1, Kingston on Raider's Minnie of Muskego; 2, Lehmann on Lilla of Chesney Farms. Junior Yearling Heifer—1, McNagny on Colleen on Killarney Farms; 2, Kingston on Queen of Waukesha Stock Farm; 3, Lehmann on Speck of Chesney Farms. Senior Heifer Calf—1, Kingston on Tristan's Golden Glory; 2, Kingston on Muskego Hope; 3, Lehmann on Top of Chesney Farms; 4, Lehmann on French Maid. Junior Heifer Calf—1 and 2, Lehmann on Faith of Chesney Farms and Pride of Chesney Farms. Get of Sire—1, Lehmann on Get of Pinecrest Kings France; 2, Kingston. Produce of Cow—1, Kingston. Graded herd—1, Lehmann; 2, Kingston. Breeder's young herd—1, Kingston; 2, Lehmann. Breeder's calf herd—1, Lehmann.

Senior and grand champion bull—Pinecrest King France. Junior champion bull—Hambro of Lookwell Guernsey Farm.

Senior and grand champion cow—Rag Apple. Junior champion heifer—Tristan's Golden Glory.

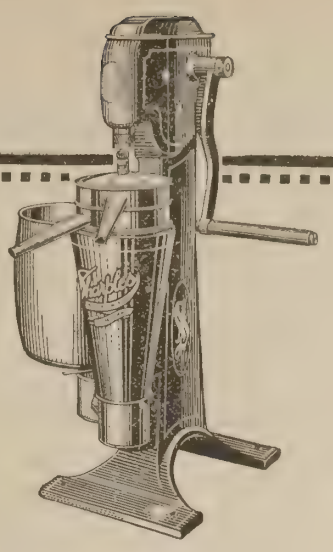
Jerseys

Exhibitors: A. L. Wheeler & Son, Edward E. Zike, and H. O. Shaw, all of Indiana; J. K. Dering, W. J. O'Hair & Sons, W. A. Brewerton, all of Illinois; and Henry County Jersey Bull Association, Indiana.

Judge: M. D. Munn, Minnesota.

Again the Jerseys led the other dairy breeds in the number of cattle exhibited but the margin over the Holsteins in this year's show was by no means as large as in former years. Three herds from outside the state competed with the herds of Wheeler, Shaw, and Zike and two entries from the Henry County Jersey Bull Association. The Wheeler herd was out for the first time in a number of years and that they have been doing some good consistent breeding during this time is shown by their many winnings in such strong competition. Their senior and grand champion cow, Hugo's Rosette, was an outstanding cow. Her large size and straight lines combined with plenty of refinement and quality and a strong mammary development made her a ringside favorite although Judge Munn found it difficult to decide between her and Dering's Yolande's Fairy.

Shaw was out again this year with another strong herd. His yearling bull, Belle's Togo's Lad, was an easy winner in his class and a strong contender for the junior championship. He is a bull of wonderful style and finish but lost the championship because of being a little slack in the middle. Another exceptionally strong entry from the Shaw herd was the senior heifer, Premier's Star Beauty. She was a ringside favorite from the beginning and when she was placed second to Eulinda of Cedar Crest it brought many protests from among the Jersey men present. Judge Munn criticized her for being a bit slack in the spring of her ribs but many felt that her better udder development was more important than this slight deficiency in spring of ribs.



Dering was the strong winner from the herds outside the state especially in the female classes and the groups. He captured ten of the seventeen first prize ribbons and one championship.

The list of awards are as follows:

Bull 3 years or over—1, Zike on King Melia Ann's Jolly Boy; 2, Wheeler on Eminent's Attorney; 3, Brewerton on Raleigh's Acland; 4, O'Hair on Rosebud's Champion Lad. Bull 2 years and under 3—1, O'Hair on Sophie 19th's Tormentor 5th. Bull 1 year and under 2—1, Shaw on Belle's Togo's Lad; 2, Brewerton on Legacy's Jolly; 3, Brewerton on Jap's Interested Boy; 4, Dering on Roses Big Chief. Senior bull calf—1, Brewerton on Peter the Great; 2, Zike on Kink of Jolly Boy; 3, O'Hair on Sophie's Rosebud's Tormentor; 4, Brewerton on Rubaiyat Raleigh. Junior bull calf—1, Wheeler on Rosabel's Golden Eminent; 2, Dering on Cedar Crest Jolly Tar; 3, Shaw on Prince Premier Lad; 4, O'Hair on Sophie's Domino Tormentor.

Cow 4 years or over—1, Wheeler on Hugo's Rosette; 2 and 3, Dering on Yolande's Fairy and Fairy Boy's Ulanda; 4, Brewerton on Mauser's April Flower. Cow 3 years and under 4—1, Dering on Fairy Boy's Violette; 2, O'Hair; 3, Brewerton on Pennithorpe Thornbury. Heifer 2 years and under 3—1, Dering on Eagle Chief's Fairy; 2, Wheeler on Mapleshade Moselle; 3, Brewerton on Cowslip's Gentle Sultana; 4, O'Hair on Guenon's Fern Rosebud. Senior yearling heifer—1, Dering on Eagle's Chief's Eulinda; 2, Shaw on Leader's Silver Jewel; 3, O'Hair on Rosebud Rose; 4, Brewerton on Etta Brookhill. Junior yearling heifer—1 and 2, Dering on Eagle Chief's Christina and Eagle Chief's Yolande; 3, Wheeler on Attorney's Aster; 4, Wheeler on Attorney's Arabis. Senior heifer calf—1, Dering on Eulinda of Cedar Crest; 2, Shaw on Premier's

(Continued on page 342)

It's not what you save on a separator—but what you save through it.

You may be able to buy a cheaper separator than the Sharples—made cheaper of cheaper materials and without the Sharples *basic* feature of *clean skimming at all speeds*. Sharples also delivers cream of unchanging thickness.

In addition to this great butterfat-saving advantage, the Sharples has other exclusive features: Simple, one-piece tubular bowl—no discs, easiest to clean. Knee-low supply tank—no heavy lifting. Once a month oiling system.

But the little you may *save* on the purchase price, you *lose* over and over again in cream *wasted* by imperfect separation, due to turning underspeed.

You buy a separator to do a certain thing—to get the *most cream* out of your milk, day in and day out, no matter at what speed you or your man turns.

Sharples Suction-feed Separator is the only separator which does that certain thing, *certainly*.

Any separator that does less is an *extravagance*, no matter *what price you pay for it*.

Your butterfat savings soon pay for a Sharples.

"The thrift separator for the thrifty farmer." Saves fat, also labor in operation.

Write for catalog to nearest office, addressing Dept. 10.

At the National Dairy Show

The National Dairy Show at Columbus, Ohio, Oct. 10th to 19th gives us an opportunity to show a complete exhibit of dairy and creamery machinery. The ordinary sources of advertising are generally inadequate to demonstrate how complete our line really is.

Our Exhibit will occupy the entire center space of Building No. 1 which is the first building you will enter after going through the main entrance.

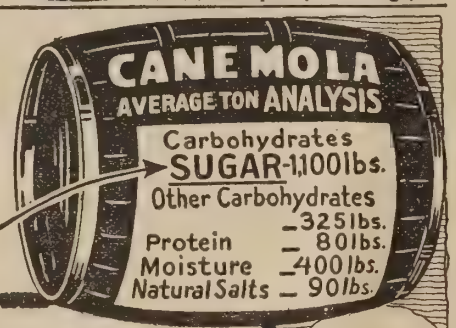
Our representatives will be on hand to explain thoroughly, everything on display. This means that a visit to our Exhibit will be of great educational value to anyone interested in the dairy or creamery.

The Creamery Package Mfg. Company,
68 W. Kinzie St., Chicago, Illinois.

DEHORNING STOPS LOSS

Cattle with horns are dangerous and a constant menace to persons and to other cattle. Dehorn quickly and easily with a

KEYSTONE DEHORNER



All over in 2 minutes. Not a harsh method. A clear, clean cut. Cows give more milk; steers make better beef. Send for free booklet.

This Sugar and Natural Salt mean Better Feed, Healthier Stock at Less Cost

Cane Mola is simply pure, 100% sugar-cane molasses —*not* a mixed feed, *not* beet molasses. As shown by the average ton analysis (see illustration) it contains approximately 55% sugar—this because science has not discovered any economical method of extracting this sugar from the molasses. Its feed value in itself is remarkably high—yet Cane Mola is much cheaper than corn.

CANE MOLA

Your great advantage lies not alone in the high feed value of Cane Mola itself, but also in the fact that it makes home grown coarse feeds palatable, thus giving them the feed value of the higher priced feeds, at much lower cost. Cane Mola will increase milk yields from 15% to 25%, will fatten stock at lower cost, will keep them in prime condition, correct digestive disturbances and prevent colic, on account of the natural salts it contains. Use it for cows, hogs, horses, sheep, etc.—add to grain or forage. Stock eat it up clean; therefore, Cane Mola eliminates waste.
Endorsed by Government Experiment Stations. Sold in 600-lb. barrels or smaller sizes, if desired. Decide now to feed your stock better at lower cost. Write us—today.

Pure Cane Molasses Corporation, 69A Wall Street, New York City.
Distributing Points: Milwaukee, Chicago, Des Moines, Cedar Rapids, Omaha, Boston, Philadelphia, New Orleans, Key West.

Cow Testing Associations

RECORDS, PRICES OF FEEDS, FAT, AND MILK

Following is the summary of reports received during the past week and up to the time of going to press of this issue:

State	Association	Tester	Month	No. of cows tested	No. of cows producing over 40 lbs. fat	Fat production of high cow	Owner
Wis.	Sheboygan Falls	E. P. Lindow	Aug.	424	6	50	A. Arnold
Tenn.	Rutherford Co.	E. M. Prewitt	"	310	7	50	A. L. Jones
Wash.	Whitman—Spokane	R. C. Johnson	"	264	31	72	T. S. Griffith
Va.	Orange Co.	R. S. Gillispie	"	360	35	78	F. S. Walker
Wis.	Hebron	F. J. Molzahn	"	378		35	S. B. Simons

Association Notes

Rutherford County, Tennessee:—One of our members plans to improve his barn, another will erect a new silo, and a third is taking up Register of Merit testing. Production has increased from one to ten pounds to a cow in eleven herds. The creamery buys cottonseed meal co-operatively. Fifty-three cents was paid for fat in August. We are securing feeds at the following prices: Cottonseed meal, $58 per ton; bran, $38; alfalfa, $25; silage, $4; shorts, $39; and corn and cob meal, $1.40 per bushel.

Sheboygan Falls, Wisconsin:—Three unprofitable cows have been sold and one pure-bred bought. Twenty-two members are using pure-bred sires. All have silos and several have two. Those who have fed silage during the summer kept the milk flow of their herds up better and at a much lower cost than those who did not have silage. The cheese factory pays from $2.11 to $2.23 per hundred pounds for milk. Butter retails for 55c and cheese 32c. Feeds cost as follows: barley, 98c per bushel; gluten, $47 per ton; Big Q, $46; oil meal, $60; oats, $45; and alfalfa hay, $33. Pasture is very poor.

Whitman—Spokane— August milk sold here for $3.12 per hundred pounds, a test of 3.6 per cent being required. The creamery paid 52c per pound for fat, and retailed butter for 55c to 60c. Milk retails for 15c. Feeds are priced here as follows: Corn, $76 per ton; oats, $70; bran, $30; oil meal, $70; alfalfa, $32; and albers, $41.

Orange County, Virginia:—Milk is marketed from our association largely on a gallon basis, the August price being 35c per gallon, a test of 3.5 per cent being required. The creamery paid 82c per pound fat.

Fergus Falls, Minnesota:—Herman Telkamp owned the highest producing cow in the association, one which made 58.8 pounds of fat for the month. Two herds averaged above 25 pounds of butterfat. They were owned by M. C. Kronemann; his nine cows averaged 944 pounds milk, 39.8 pounds fat and that owned by Wm. Right, with ten cows averaging 987 pounds milk, and 34.1 pounds fat.

Walla Walla, Wash:—The large number of dry cows (61) for the month of August, is due to the fact that a great many dairymen have managed their cows so as to have them fresh in the fall of the year.

With hay at $22 a ton in the stack, and mill feed at $32 a ton, the dairyman that does not test his cows is in danger of paying the cow's board rather than having the cow pay her way. During the first of the week Mr. W. E. Gross sold at auction some of his old cows. Seventy-two head were sold averaging $112 each. Prior to the sale of each animal her cow testing association record was read which gave the buyer an idea of what he was spending his money for. Mr. Gross will be back in the association as soon as his young animals start to freshen. Mr. Gross' idea of the cow testing association records as a sale value were expressed in these words: "The cow testing association records helped the sale of my herd more than any other thing."

Dairymen's League Directors Hold Important Meeting

The Dairymen's League Directors' meeting in Syracuse, September 12th and 13th, passed several resolutions of the greatest importance to everyone connected with the dairy business.

The most important act of the directors was the adoption of the Warren formula for finding cost of production of milk. This method of determining costs already has the approval of the United States Food Administration. Space will not permit anything but a brief explanation of this formula here. The principle of the formula is that on the average it takes the following factors to produce a hundred pounds of milk testing 3.8%: 33.9 lbs. of grain, 43.3 lbs. of hay, 10.8 lbs. of other dry forage, 102.5 lbs. of silage and other succulent feed, 3.02 hours of labor and 25% of the cost of the above factors for miscellaneous factors such as pasture, depreciation, etc.

If the market values of each of the above factors are obtained, the sum will be the average cost of production of 3.8% milk. But, of course, it costs more to produce milk in some months than it does in others. To care for this variation and to find the cost of production for any particular month, the average monthly price as obtained above must be multiplied by a percentage factor which has been worked out as correct to give the proper variation for each month. This factor will be more than a 100% in winter and less in summer. For instance, suppose the average monthly cost for producing milk is found to be $2.80 per hundred (this figure, of course, is not correct, but is only given as an example.) To find the price for November when milk is high, the average yearly price, $2.80, would be multiplied by 119% which is the percentage variation factor for November; and to find the price for June, $2.80, the average price, would be multiplied by 70.6%, which is the percentage variation factor for June. The directors did not actually determine the October cost of production, but left it to be found by the executive committee using the formula and the present costs of each factor in the formula.

The formula has been worked out by Professor G. E. Warren of the College of Agriculture at Ithaca from the great mass of evidence on the cost of milk production which has been collected in the last few years. The formula is a scientific method of determining the cost of producing milk, and is fair to everyone concerned because prices made from it represent the real costs of production. It will be especially acceptable to farmers because it insures them fair prices for their milk by giving them costs on all the factors that go into the production of milk.

The directors voted to ask the dealers for a six months' contract beginning with October 1st but the prices will be determined from month to month by use of the Warren formu

a. The long contract will be very acceptable to dairymen and at the same time by the use of the formula they will get the benefit of the change in prices in cost of production.

Another very important resolution passed by the League directors was that of changing the zone where the base price of milk is set from 150 miles from New York City as it now is to 250 miles from New York City. The League has contended for some time that the based price for milk should be determined nearer the center of milk production, and that 150 miles from New York City was nowhere near the center of milk production.

One of the most important resolutions adopted by the directors was to vote back money to local branches for expenses. Every branch will receive 30c for every member that is paying his 1c per hundred League dues. This rule will cause much satisfaction and will put new life into local branches.

A more united or successful or important meeting of the League directors was never held. The spirit of hopefulness for better dairy conditions prevailing throughout the two days' sessions was justified by the knowledge that dairymen will obtain very fair fall and winter prices.—Publicity Department of League.

Cheese Exhibit at National

A big revival in the cheese industry, due to new dairy conditions brought about by the war, is forecast by promises of big cheese entries for the National Dairy Show to be held at Columbus, Ohio, October 10-19.

Ohio manufacturers alone are arranging to show two tons of Swiss cheese this year, against but one entry last year and none the year before. They are working in co-operation with the dairy department of Ohio State University with a view to demonstrate that as good Swiss cheese is made in Ohio as in Wisconsin and is good as any imported from Switzerland.

Big entries of cheese are promised also from South Carolina and Georgia. Wisconsin and New York, ranking first and second, respectively, in cheese making in this country, are expected to see to it that they will not be outdone by other states.

Ohio cheese manufacturers expect to form an association during dairy show week to boost the sale of Buckeye products. One hundred Swiss cheese plants are in operation now in the state.

Ohio men say the Swiss cheese industry started in this country at Alliance, this state, but that it was crippled by the rapid growth of cities in northeast Ohio, affording a big retail milk trade, and by the establishment of creameries and evaporating plants.

The war again has made cheesemaking profitable, and they expect the industry to expand rapidly the next few years. Ohio State University is arranging a special four or five weeks' course in cheesemaking for next winter.

Indicating the importance Canada, after four years of war, attaches to the dairy industry, is word that Quebec and Ontario will send eight to ten cars of dairy cattle of various breeds to the show. Canada was not represented at the show last year. Cattle entries are being made from remote parts of the country as well as nearby states. NATIONAL DAIRY SHOW.

The sacrifice of the American home, added to the efforts of the American farmer, has removed fear from the minds of our allies for this year, at least.

It is as much the duty of the consumer to eat less as it is the duty of the farmer to produce more.

I Am Public Opinion

All men fear me!

I declare that Uncle Sam shall not go to his knees to beg you to buy his bonds. That is no position for a fighting man. But if you have the money to buy and do not buy, I will make this No Man's Land for you!

I will judge you not by an allegiance expressed in mere words.

I will judge you not by your mad cheers as our boys march away to whatever fate may have in store for them.

I will judge you not by the warmth of the tears you shed over the lists of the dead and the injured that come to us from time to time.

I will judge you not by your uncovered head and solemn mien as our maimed in battle return to our shores for loving care.

But, as wise as I am just, I will judge you by the material aid you give to the fighting men who are facing death that you may live and move and have your being in a world made safe.

I warn you—don't talk patriotism over here unless your money is talking victory Over There.

I am public opinion!

As I judge, all men stand or fall!

The Cow and Machine Milking.

(Continued from first page)

of adaptability. Other machines have different sized cups to fit cows having teats of different sizes. Even though the teat cups are of the proper size, the operator should see that the teats are in normal condition. In cold, wet weather, the teats may wrinkle and contract. The operator should see that they are brought into normal shape and see that the cups get a straight and proper grip on the teats.

The operator should understand how to regulate the pulsation of the machine to suit the individual cow. The rate of speed of the pulsator varies with the different machines. Even the length of squeeze and the length of release in the pulsation varies. These the operator should understand how to adjust so as to make the machine do more efficient work without discomfort to the cow. A short, rapid pulsation is not suitable for a cow with long teats that is a hard milker. On the other hand, a long, slow pulsation is not conducive to rapid milking if the cow has short teats and is an easy milker. No rules can be laid down for this. The operator must use his own judgment.

Take Time to Prepare the Cow

In the experiments with the different kinds of milking machines, at the South Dakota State College, it has been thoroughly demonstrated that it does not pay for the operator to be in too big a hurry to attach the milking machine. Some cows respond to the milking machine immediately, but others do not.

In the College herd there is one cow that gives down her milk at once. When the machinery begins to operate, this cow longs to be milked as though she were expecting her calf. By the time the milker reaches the cow, she has released her milk supply. With such a cow, the machine can be attached at once after the teats have been slightly moistened and brought into normal condition. Other cows in the herd do not give down their milk until the operator begins to work gently with the cow's udder. Cows that are almost dry may hold up their milk for a minute or more. The point is, that the machine should not be attached until the cow has given down her milk. Take time to prepare the cow properly.

The Difference in Cows

The cows that have been, and are being, milked with the different milking machines in this experiment at the South Dakota State Experiment Station belonged to the following leading breeds of dairy cattle: Ayrshire, Holstein, Jersey, and Guernsey. In addition, various grades are also being milked by machine.

The individual cows within one breed and the cows belonging to the different breeds do not milk alike. This is true when milked by hand and it is also true when milked by machine. Each cow must be handled and milked differently. If all of the cows were handled and milked alike mechanical milking of cows could not be said to be an entire success, but by understanding individual cows and adjusting the mechanical milking process in accordance with the characteristics of the cow, all of the cows in the College herd have been milked successfully and practically with the different milking machines.

Nervous Temperament of Cows

There is much difference in the nervous temperament of cows. Some cows are quiet and appear never to be excited. Such cows pay little attention to whether they are milked by hand or whether they are milked by machine. Other cows, again, are sensitive. This is true whether they are milked by hand or by machine.

This nervous disposition of cows is probably shown most when the milking machine is first put into use. Most cows realize the change from hand milking to machine milking. When the machine is first used, most of the cows will turn their heads and look at the machine with an expression of nervousness in their faces. Especially is this true if the strange machine is operated by a strange man.

A few cows in a herd will at first refuse to give down their milk completely. However, if the machinery is operated by the regular attendant and the cow is properly prepared, the cows that will not milk well from the first are few in number. Indeed the number of cows that refuse to give down their milk when machine milking is first applied seems to be limited chiefly to the cows that are very nervous and give only a small amount of milk.

Machine milking should not be forced too fast. Allow the cows a reasonable amount of time to get adjusted to the new method of milking. Do not lose interest in mechanical milking if the amount of stripping is large at first.

Immediately after freshening, when cows are first taken from the calf, some cows reluctantly give down their milk. Excitement of any kind is likely to cause a cow to hold up her milk. Due consideration should be given to cows in this connection.

Cows That "Give Down" Slowly

The cows that give down their milk slowly may be put under three heads:

First, cows that do not readily give down their milk when milking begins. There is much difference in cows in this respect, no matter what method of milking is employed. Some cows give down the milk as soon as the milker approaches them. In fact some of the cows release the milk

THIS DRAWING ILLUSTRATES THE THREE PROCESSES THAT MUST WORK TOGETHER IN HARMONY IN ORDER TO PROPERLY MILK A COW, WHETHER IT BE HAND OR MACHINE MILKING

We are wont to think of extraction only, but we know that in hand milking a cow gives down a small quantity of milk from the first two teats and then we change to the other two. Release and secretion are concerned in the process and due consideration must be given to these if the best success is to be assured. Read, and then re-read what Professor Larsen has to say on this important topic.

oon as they hear the machinery in peration.

The manner in which the cow gives own her milk is a characteristic hich belongs to that individual. It s possible that in some instances it is habit. It is claimed by some that he habit of a cow in this respect may e influenced by regular milking time nd uniform method of starting a ow during the first lactation period. ersonal experience leads the writer o believe that, generally speaking, ne manner of giving down the milk natural, and therefore is an inerited characteristic.

Secondly, some cows give down ne milk very slowly or little by little. usually cows belonging to this class re not heavy milkers and such cows o not milk as well by milking mahines. This slowness of releasing ne milk may be due to two things: rst, the lack of ability of readily tting down the milk,—the milk ucts may not be sufficiently large o allow the milk to come down from ne upper part of the udder as fast as is being milked. This is a natural naracteristic and cannot be changed. econdly, it may be due to the cow illfully holding up her milk and reasing it only at intervals.

From the illustration it will be een that the milk ducts branch and ebranch. At the beginning of each ranch there are muscles, the closing nd opening of which are under the ontrol of the cow. If for some reaon the cow is nervous, she is likely o close these little gateways and to ontract the milk ducts, and in that ay prevent the free release of the ilk. Whether this slow release of ne milk is voluntary or involuntary, seriously interferes with the operaon of the milking machine.

Thirdly, there are some cows that eadily give down one-half to threeourths of the milk. The remainder released very slowly, and it is often eld up entirely by the cow when ilked by machine. Such cows show large percentage of milk in the orm of strippings. If such cows are iven time to release the milk fully efore the machine is attached, and ne work of the machine is not forced the last stage of milking, this form f slow milking can be perceptibly elped.

he Method Followed in Hand Milking

From a standpoint of the cow, it is ne different kinds of slow milkers nat are likely to cause most of the oubles encountered with milking achines. So far as the writer has een able to ascertain, the reason is obably this: Those who have ilked cows by hand know that about pint of milk can be drawn from all ows. It is not necessary to wait for cow to give down this milk. It is ored in the milk cistern in the low- part of the cow's udder. A cow as no control over this. The obtaing of this milk is mechanical. It is easy matter to make a milking achine successful if this were the ly part of the milking process. It ould simply be a question of extracon of milk from the cow's udder, r which all the present milking maines in use in the College herd have onderful adaptability.

In order for a milking machine to ntinue to do successful milking, th the operator and the cow play portant parts. The secretion, the lease, and the extraction are three ocesses that must function proper- and harmoniously together.

When this first part of the milk s been drawn, the hand milker must ait until the cow releases or gives wn her milk. Then the hand milk- proceeds to milk the two teats. a short time there is no more milk. ne hand milker then changes the opation to the other two teats. When there is no milk in these, he returns to the first two and so on until the cow is dry.

Machine Milking a Continuous Operation

The milking machine is unable to do this changing from one-half to the other half of the udder and to stop milking and wait for more milk. The milking operation is continuous. The machine is not conscious of the time when the milk supply runs low. The operator must supply the intelligence for the machine. Unless the milk has been released by the cow, it is not in the lower part of the udder to be drawn by the milking machine.

If there is no milk released by the cow, the suction and pulsation of the machine is applied to the internal udder tissue of the cow instead of on the milk. When this happens, there is much danger of the cow gripping herself, and not giving down or releasing her milk normally. The internal part of the cow's udder many times is sensitive to this action of the milking machine. Some cows even show signs of opposition and even discomfort by drawing up the stomach. When such a condition is reached, the milking machine and the cow are working at cross purposes and not harmoniously. The cow holds up her milk and the machine continues to pull. This condition the operator should seek to avoid, if he expects the milking machine to work successfully.

There is a difference between the action of the machine on cows that are holding up their milk and on cows that are entirely dry. The suction and pulsation on the cow's udder when dry or at any other time do not injure the cow herself, except in so far as to hinder her giving down her milk normally.

The operator must learn how each individual cow milks and adjust the machine accordingly. Some cows will give down the milk without any difficulty, even if the machine milks faster than the cow gives it down; while others again do not milk well unless the release of the milk by the cow goes on faster than the extraction of the milk by the machine.

Effect of Period in Lactation

Apparently some cows milk well by machine throughout the whole lactation period, while the other cows respond quickly and readily to the milking machine throughout the first part of the milking period, and during the latter part they are irregular.

This is true when milked by hand, and it is true when milked by machine. However, the hand milker can easily adjust the milking to the cow. He knows exactly when the slowness of giving down the milk begins. The adjustment of the working of the milking machine to suit such a cow is not so easy. Unless the milker is very familiar with the manner in which each cow of the herd behaves towards the milking machine, he cannot well adjust the machine.

Generally speaking, the latter part of the lactation period is not a good time in which to introduce the milking machine. Some of the cows are likely to hold up their milk often enough and long enough to cause the cow to dry up earlier than she otherwise should.

Effect of Abnormally Shaped Udders and Teats

The milking machines have a very wide range of adaptability for milking cows having unevenly shaped udders and teats of different size. However, if the udders of a few cows in the herd are abnormal, the adjustments will probably be so numerous that machine milking will be more or less discouraging.

Some herds contain cows, the hind udders of which may hang low; the

WATERLOO BOY
The Original Kerosene Tractor
For War-Time Speed in All Farm Work

Thousands of Waterloo Boy tractors are drafted into service to speed up farm work—standing the most drastic service tests in field and belt work.

Its three-plow pulling capacity and 25 horsepower at the belt, easy handling and dependability give it the widest range of usefulness on the average farm.

1 Man
2 Speed
3 Plow

Stands on the Bedrock of Over 4 Years Proven Success

The Waterloo Boy has long since passed the experimental stage. It has the confidence of the farming world because of exceptional performance in the hands of users.

Powerful, quick-starting motor, perfect kerosene-burning manifold, automatic lubrication, complete and easy accessibility of working parts, are some of the features you will appreciate.

Illustrated catalog, sent free, shows detailed construction and numerous photographic views of Waterloo Boy tractors at work on farms. Write for it.

Waterloo Gasoline Engine Co.
4102 W. 3rd Ave. Waterloo, Iowa

Belt Power for 24 to 26" Thresher or 17" Silage Cutter

When You Buy a Tractor—

REMEMBER, it's the plows, disks, drills, binders, ensilage cutters, feed grinders, threshers and the like that do your farm work. The tractor is useful only as it furnishes cheap, dependable power for **all** the other machines.

That's why we say, if you need a tractor, you can't make a mistake in buying an **International kerosene tractor.**

We have had over 75 years' experience with farm machines. We know the kind of power they require—all of them. For over twelve years we have sold tractors that supplied that kind of power. We know from experience that the sizes and styles of tractors we sell today will work with the machines you depend upon for your success and prosperity. And—our tractors all operate successfully on cheap kerosene.

When you buy an International kerosene tractor you buy with it the benefit of our long farm machine experience and all the advantages of dealing with a service organization which brings a well stocked branch house or a live, wide-awake retail dealer within telephone call of you. It may surprise you to know that an International tractor, plus these advantages, which no one else can give, costs you less per year of active service than any other tractor sold in anywhere near the same numbers.

Eckles to Minnesota

Professor C. H. Eckles has accepted the position as head of the Dairy Husbandry Division of the Minnesota College of Agriculture. It is expected that he will take charge of the division about October 15.

Professor Eckles leaves the University of Missouri after serving seventeen years at the head of the Dairy Husbandry Department. His work along production lines at that institution has given his name high place wherever scientific dairying is known. He is a national authority on subjects pertaining to the feeding and management and the breeding of dairy cattle. His experimental work gives him the foundation material in his text book, "Dairy Cattle and Milk Production", which is accepted as the best published on the subject and is used in nearly all agricultural colleges. More than forty scientific articles in experiment station bulletins and scientific journals have appeared over his signature and he is a joint author of the text book, "Dairy Farming". He has been invited to many states to discuss dairy problems at farmers' meetings and has been offered the chair of dairy husbandry in at least nine states.

Perhaps the largest service Professor Eckles has rendered the dairy industry is the graduate instruction he has given students. In addition to the under-graduate work of the Missouri Dairy Husbandry Department, he has directed the dairy graduate work of more men than has any other professor of dairying. More than one-third of the heads of dairy departments in the agricultural colleges of the United States are his former students.

PROFESSOR C. H. ECKLES

The State of Minnesota is fortunate in enlisting Professor Eckles' aid in building its dairy industry. His ability is proven by long years of consistent, practical accomplishment; he is splendidly qualified for his new work.

April 1-2, '19—Holsteins. Pure-bred Live Stock Sales Co., Brattleboro, Vt.

Wheat Mill Feeds

HOARD'S DAIRYMAN:—There are three factors to make bran scare at the present time. There was very little flour milling in the late spring and early summer as most mills were out of wheat and the nation was obliged to use flour that had been previously milled plus the government's amount of substitutes. From March to July there was practically no wheat mill feed turned out, simply corn and barley mill feed.

Fixing the price of flour with prospects of a plentiful supply made it seem unnecessary for the flour buyer to buy freely or carry any in stock. The one idea of fixing prices is to make goods move fast because there is no money to be made by holding them. This same rule also prevents people from buying until the last minute, because why should they tie up their money with something that was not immediately needed?

The result has been that the flour mills are suffering greatly from lack of orders, many of them having their warehouses filled with flour. The result is a very light production of wheat feed.

Ordinarily we depend upon the lack of demand in summer to accumulate large supplies of wheat feeds for fall and winter use. This year we have not any accumulation and almost no stocks at all. It is true a bushel of wheat will produce so much bran when ground, but if the wheat is not ground until later on we can't get the bran now.

Another factor that most people overlook is a shrinkage of 10 per cent in the yield of wheat feed in a bushel of flour. The new government regulations call for closer milling which means that more feed goes into the flour. It is estimated by competent authorities that this shrinkage alone amounts to over 500,000 tons, based on our estimated grinding of flour for the crop year to supply one hundred and ten million people.

Last year a great deal of flour was ground and exported which left more feed behind. This year it is probably more expedient to ship the wheat because it takes less room in boats than does flour.

The third reason is the one that is known to everybody, that when a thing is very cheap the man nearest the place of sale has the best chance to get it. In previous years the large milling sections of the Southwest, particularly in Kansas, always had mill feed to ship east, but this year there was a drought and nothing came east at all.

Undoubtedly a great many farmers have bought bran in the West and fed it to other than dairy animals, something they never did before.

It is true bran is not equal in fattening value to corn or middlings either, but the price is so attractive that these feeds are fed to horses, poultry, beef, sheep, and hogs and the dairy cow does not get her share. The farmer is getting the bran, but not the dairy farmer.

The government is using considerable bran also for feeding horses. This is a new departure and requires a considerable amount.

It will be very difficult to artificially distribute mill feeds so as to supply all sections. A man that sells wheat to the mill claims that he is entitled to the bran, and it will be very hard to satisfy him if it is taken away from him.

There is no one who can decide how much bran each state should have and where it should be shipped from. This would puzzle a Solomon. If the method were pursued of making the mills ship the same amounts or ratio of amounts that they did to each state last year it does not follow that this would be equitable at all, because in some months some states were buying freely and others were not, and conditions might be reversed this year as far as their requirements are concerned. On the other hand, from January to March last year the western mills were not able to ship east and sold their feed in the West very largely. This is no reason that the same method should be pursued this winter.

It is very easy to insist that mill feeds be distributed, but we would like to hear some one suggest a practical way of doing it.

It must be remembered that commodities do not distribute themselves. It takes merchants, money, men, and warehouses to distribute all of the products of this country. Any one undertaking to do the distribution of millions of tons of feed must provide all this machinery of trade. In the past this has been done by the jobbers who have acted as bankers and warehousemen. Not being able to get any wheat feeds their work of distribution and their facilities are eliminated.

Illinois. R. W. CHAPIN.

The New York Butter Market

New York City, Sept. 24:—Butter certainly tastes of money these days. Never since the days of the rebellion has the consumer been asked to pay so much for his butter as at the present time. When the wholesale value of a tub of butter approaches $40 there is a feeling that there has been a material advance in the cost of living. But even at the present high prices the consumer is eager to get butter. The demand is stronger than it has been at any previous time this year. Whether or not that condition will continue with the advent of cooler weather is problematical. At the first approach of fall there has always been a marked tendency for the consumer to use oleo or some other so-called butter substitute. Without doubt that influence will be felt here in a short time. However, there are several factors that will tend to keep the demand for butter stronger than in previous years. In the first place, the consumer, whether laborer or professional man, is becoming accustomed to pay high prices for his provisions; secondly, the publicity that has been given butter and other dairy products as food necessary for proper maintenance of adults and for growth of children is bearing fruit in that demand for those products is becoming stronger each year; and, third, the government has placed an embargo on importation of certain nut products that are essential in the manufacture of nut margarines which will tend to limit their production. However, we may expect that the present excited feeling in the market will not last indefinitely, although prices will undoubtedly remain high for a long time to come.

Since last week the quotation on extras has advanced five cents. From Wednesday to Saturday the price advanced one cent each day. On Monday because of a slight accumulation of stocks, there was no further advance but today the quotation is up one cent. The extremely high price of butter makes it seem probable that there may be slight temporary fluctuations in prices of butter but extreme quotations will undoubtedly prevail all winter. Strong local demand is keeping considerable quantities of butter from the large markets. Larger shipments are expected in the near future because of the seasonal increase in production and because the high prices will to some extent curtail local sales. At the close today quotations were as follows: Extras (92 score), 61c; higher scoring than extras (93 score or higher), 61½@62c; firsts (88 to 91 score),

58@60½c; and seconds (83 to 87 score), 52@57c.

The Food Administration has increased the margin allowed holders of storage butter for stocks requisitioned by the government from one to two cents per pound. The increase was the result of a strong petition on part of such holders to the government as it was their contention that unless a wider margin were allowed many of them would lose money on their stocks. W. B. LIVERANCE.

Acts to Cut Price of Milk

HOARD'S DAIRYMAN:—Stephen G. Williams, chairman of the New York Milk Committee, has issued a call to Dr. Charles E. North, secretary of the National Commission on Milk Standards, for a meeting of that body to investigate the high cost of milk and to suggest, if possible, ways and means for milk price reduction. It is also suggested by him that the Commission disclose the effect, if any, that the high price of milk has had upon the health of the people, more particularly upon infants and older children who depend almost wholly upon milk for subsistence.

"There is need that plans be formulated and definite action be taken to increase the working power of the nation's individuals," states Mr. Williams in his call. "The first step in this direction should, in our opinion, be increased consumption of wholesome milk and other needed dairy products. War conditions make essential a considerable export of these dairy products, which, with the increased cost of production, have brought about unusually high prices. The effect that these have upon the health of infants and young children and upon the health and efficiency of the working population as well should be disclosed.

"Our committee believes the prices of milk and dairy products should be gone into deeply, and it desires a report from the commission as to whether they are in excess of what is necessary to give a fair return to the producer and distributor of milk and dairy products."

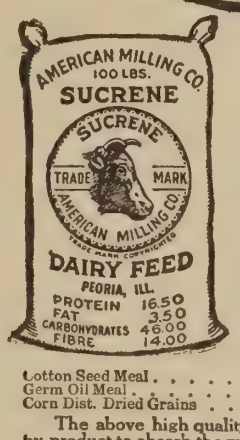
When interviewed by the writer, Mr. Williams said: "It is also the duty of the milk and dairy trade press, as well as ours, to aid in this work for it is both essential and patriotic. Every dairyman should keep good tab on his milk and milk products. A record should be kept for all the dairy products produced in one day and the producer should know exactly where every bit of it has gone. This is one of the requirements of our government."

New York. A. H. KOLBE.

Saskatchewan Creameries Unite

HOARD'S DAIRYMAN:—F. M. Logan, dairy commissioner for the Province of Saskatchewan, has resigned to become assistant general manager of the Saskatchewan Creameries, Limited. His successor is Percy E. Reed, formerly provincial dairy inspector.

The Saskatchewan Co-operative Creameries, Limited, for which Mr. Logan leaves the civil service, is an amalgamation of the 19 creameries which previously had been operated as local co-operative enterprises under the supervision and with the encouragement of the Dairy Branch of the Department of Agriculture. The new company is modeled on the plan of the Saskatchewan Co-operative Elevator Company, the greatest organization of its kind in the world, with thousands of farmer stockholders. The fact that government direction of co-operative enterprises has been a success, is shown by the government figures on output in 1916 placed at 4,310,669 lbs., compared with 66,000 lbs. annual output ten years earlier.



Illinois. G. C. LEININGER.

Save Grain for Bread

Feed Your Cows

SUCRENE DAIRY FEED

"We can no longer afford to feed our high-priced grains to dairy cows. We must feed them the by-products. It is not right to feed grains which are good human food to animals that can do just as well on feeds not fit for human consumption."
—Prof. Pearson, University of Illinois, before Chicago Milk Commission.

Cows Can Not Make Milk on Unbalanced Corn Rations

Profs. Henry and Morrison, Wisconsin Experiment Station, in "Feeds and Feeding": "With the high prices now ruling for feed and labor, on many farms, even where *good* dairy cows are kept, milk is being produced at little or no profit. Yet, by a wise selection of feeds other dairymen secure goodly profits from cows no better."

The poor results obtained when corn is not properly balanced was demonstrated at Illinois Experimental Station, where cows fed on correctly balanced rations gave 47% more milk and 39% more fat than cows fed on unbalanced corn rations. "This shows," says Prof. Henry, "the folly of expecting profitable production from such unbalanced combinations of feed."

Sucrene Dairy Feed—Scientifically Correct Combination of High-Quality Milk Nutrients

Composed of feeding materials universally recognized as high in milk-making and body-maintaining nutrition:

	Protein	Fat	Carbohydrates
Cotton Seed Meal	36.0	11.0	21.0
Germ Oil Meal	22.6	10.8	46.0
Corn Dist. Dried Grains	29.2	11.4	39.4
Ground and Bolted Grain Screenings	10.5	3.9	61.1
Cocoanut Meal	20.9	8.1	45.3
Pure Cane Molasses	...	...	66.0

The above high quality feeding nutrients in Sucrene Dairy Feed are combined with just enough clipped oat by-product to absorb the molasses and to supply the bulk which every good cow feed must have. They are mixed in exact proportions for milk production and body maintenance. Small percentages of calcium carbonate and salt are added for necessary mineral matter.

SUCRENE ALWAYS INCREASES MILK FLOW. All cows relish and thrive on Sucrene because of its variety, high degree of palatability and digestibility. They need no other concentrates. Sucrene alone, with the usual roughage, keeps them in better health, larger milk flow all year, at a substantial saving in feed cost.

Better order a ton from your dealer to avoid transportation delays. If he can not supply you write us. The coupon or a post card brings you literature on care and feeding of live stock which you will find of great value.

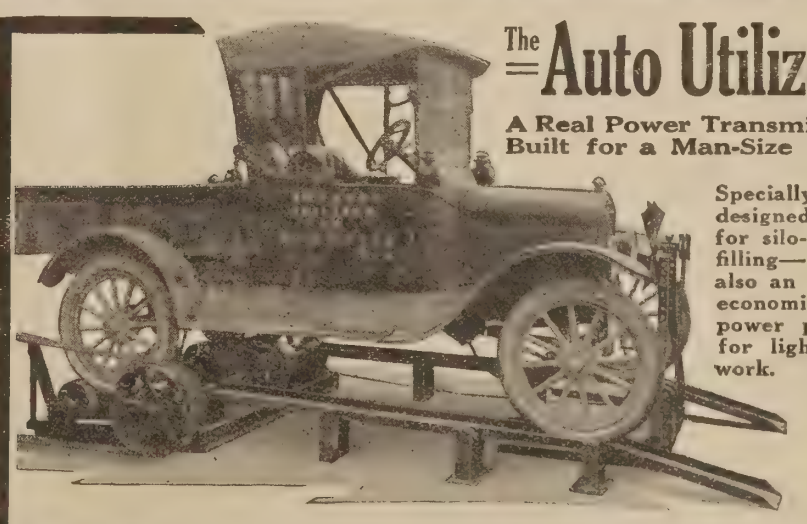
Camburn to Vermont Dairy Department



O. M. Camburn has been appointed Extension Specialist in Dairy Husbandry at the Vermont Agricultural College. He is a graduate of Iowa State College and for the past three years has been connected with the Dairy Division of the United States Department of Agriculture in general dairy extension work. For about one year, under a co-operative agreement with the State Department of Agriculture, he has been in charge of the cow testing association work in Vermont. He is thus well acquainted with New England conditions and the Vermont Department is to be congratulated upon securing the services of so competent a man.

Vermont. H. B. ELLENBERGER.

Figures collected during a recent child-welfare campaign in St. Louis County, Minnesota, proved that, owing to improper diet, a large majority of the children were subnormal in height and weight. Fifteen hundred of these have promised the agent to drink a pint of milk a day, or to "howl till they get it."

The Auto Utilizer

A Real Power Transmitter Built for a Man-Size Job

Specially designed for silo-filling—also an economical power plant for lighter work.

Equipped with Hyatt Roller Bearings Throughout. Tires Run on Rubber Covered Rollers

Use Any Make of Car up to 125 Inch Wheel Base. No Attachments to Car—No Jacking Up.

Price, $220.00 F. O. B. Factory **Order Today—Try It Out Before You Pay. FULLY GUARANTEED—WE BELIEVE IN IT**

THE AUTO UTILIZER COMPANY, Burlington, Wis.

EDITORIAL COMMENT

WISCONSIN has an average of nine cows to the farm. This, we believe, is the largest percentage of cow population of any state in the Union. Although the serious disturbance occasioned by the war has affected Wisconsin in common with other states, we see no letting down of interest in dairying. On the contrary, there is a very healthy growth of sentiment among our farmers to weed out the slacker cows and put their herds upon a practical paying basis.

There is a strong notion which prevails with a good many farmers who separate their own cream to the effect that it is more profitable to them to make a cream testing, say, 30 per cent or under rather than 40 to 50 per cent. They are utterly wrong in this for two good and sufficient reasons:

1. The low testing cream robs the farm of a large amount of skimmilk. Such skimmilk is easily worth 85 cents per 100 lbs. as a feed for calves and young pigs in these times.

2. Rich cream keeps sweet much longer. To those sending cream away at a distance this is an important point. Another reason is the saving in freight in proportion to the dollars' worth involved.

SERIOUS undertakings teach serious lessons. Our country is passing through a critical period in its history. We are making tremendous sacrifices of men, money, and time. Out of this, however, we are to derive tremendous benefits. New conceptions have been brought about regarding the place agriculture holds in a nation. It is teaching everybody its importance. Farmers see the necessity of planning so they may work more effectively. They are preparing their fields to grow larger crops; selecting better seeds to grow a better quality of grain; selecting better bred animals to improve their herds and flocks.

All these things are valuable and highly commendable, but one of the most important lessons which we are bringing out of this war, and it stands out clearly and sharply, is the sacred duty every citizen owes to his government. It is teaching all of us that the government is not something separate and apart from us, but it is of us. We are fast learning that if we are to have a strong, capable, and effective government, every intelligent citizen must devote some attention and time in order that good men may be selected to pass our laws and to execute them.

HOG CHOLERA

A timely warning is being sent out by the Illinois Department of Agriculture. Farmers are reminded that the season of greatest losses from hog cholera is at hand. They are urged to be on the lookout for symptoms of the disease in their herds and to report them at the earliest moment to officials assisting in its control. Costly experience in neglecting to take every precaution preventing the spread of the contagion when it is once in the herd has taught the necessity of the Department's admonition. Prompt co-operation with state and federal authorities is declared a patriotic duty since, "It will reduce hog losses to a minimum and will make hog raising (so essential in war times) one of our safest industries."

DEMAND FOR DAIRY PRODUCTS

Dairy farmers need not fear an over-production of dairy products. The large demand for butter, cheese, and condensed milk practically assures a good market for milk the coming winter.

The government has recently commandeered 60% of all the butter in cold storage. This means it is taking the butter of those who have stored it for their customers and not held for speculative purposes. The manufacturers of condensed milk have disposed of their surplus product and they are looking about for a larger milk supply. There is also an increased demand for cheese. There is less in cold storage now than a year ago and the demand is ever increasing. This is undoubtedly due to the education which is being carried on in various ways to inform the people regarding the food value of cheese. Meat is not as plentiful as it was a year ago and the prices are higher. The improvements in our shipping conditions and the large demand for dairy products in Europe give every assurance that the prices of dairy products will be higher this winter than last.

WHAT PHOSPHATE DID

It is becoming more and more apparent that in order to develop corn or wheat, especially, the soil needs to be fed some acid phosphate. Phosphorus is an element that helps to mature the corn crop and makes it possible to develop a plump, hard kernel. We had unusually good success in one field of 65 acres of corn this year, and we stated a few issues ago that phosphorus played a large part in helping to mature this crop early and to secure good, sound ears.

One of our subscribers, Mr. Byron A. Cass, has had a similar experience in Alabama and he writes us as follows:

"I have just read your comment on "What Phosphate is Doing" in the Dairyman of the 30th ulto. and must say that I entirely agree with you, as the result of considerable experience. Herewith I am enclosing some kernels of corn from seed which was planted May 17th, 1918. It was practically matured at 100 days from planting, phosphate being used. Incidentally will say that last season a field of this corn yielded upwards of sixty bushels of shelled corn per acre, and 70 pounds of shucked ears gave 61½ pounds of shelled corn."

ANOTHER "SAFE" BULL

"——— he had never before shown any indications of an ugly disposition, and has not since been unruly."

These words are from the report of a recent fatal case of carelessness with another "safe" bull. This time the accident is in Ohio. A prominent Jersey breeder placed his confidence in an animal never to be safely trusted and was gored to death, leaving a widow, two sons, and a daughter. The bull was turned loose to go to an outside water tank and returned to his stall to be fastened again, when he turned suddenly and crushed out the life of his owner.

May these details supplement repeated warnings to those who continually expose themselves needlessly to death by carelessness with bulls. The fact that this Ohio loss was caused by a bull only two and a half years old emphasizes the wisdom of making it a permanent rule on the farm to trust no bull, regardless of how "safe" he may be.

SUPPLY AHEAD OF DEMAND

The agricultural field is occupied with a great many well meaning workers who are actively engaged in promoting new ideas of farm management, more correct understanding of the relation of scientific principles to improved practice. In short, trying to make the average farmer a more intelligent and prosperous farmer. No doubt something has been accomplished by these praiseworthy efforts, but if we look the men over carefully we will see that not more than one in ten has any real hunger and thirst for the knowledge thus offered. These few men—the one-tenth—proceed to work out the ideas they have gained and put them in shape so that they will show results. Some of the nine-tenths see what is being done and copy after it to a feeble extent. But our agricultural educators and workers are in constant danger of forgetting that men don't eat or drink unless they feel hungry or thirsty.

The first step toward the improvement and better education of the farmer is that he shall really want the knowledge that is offered him. The great hindrance with the great mass of farmers in absorbing such knowledge is a lack of ability to read and understand our so-called farm literature. We spend millions of dollars in pushing upon the farmers a lot of unread and little understood bulletins, circulars, and other literature.

From his earliest childhood up, the average farmer has had but little contact with that sort of reading. His schooling was confined to a few months in the year in the country district school where such subjects as are treated upon in bulletins were never considered or studied. No wonder then that most farmers have but little hunger for such information. It is a clear case of supply getting ahead of demand.

A TEMPLE FOR AGRICULTURE

At the recent meeting of the Federal Board of Farm Organizations a resolution was passed for the erection and endowment of an agricultural temple in the city of Washington. The resolution states that agriculture is the most important and most fundamental of all occupations; that the city of Washington offers unusual opportunities for the farmers of America to unite their interests and demand their needs; that commerce and other great interests have established general headquarters for the purpose of making their demands and desires promptly and effectively known to Congress; that the farmers of America have never had such headquarters and have suffered greatly from the lack thereof; that at this time there is need for united action among the farmers and that a national headquarters for the organized farmers of America can render a greater service than ever before.

A committee of seven was appointed by the chairman with the power to prepare plans and, when such plans have been approved by the general council of the National Board of Farm Organizations, to raise the necessary funds for establishing a temple of agriculture.

The agricultural interests of this country are large enough and of sufficient importance to be represented by an organization in the city of Washington. Agriculture has fared unusually well, considering how loosely and imperfectly it has been organized. If agriculture is to secure the national legislation it is entitled to, it must be organized. Men who thoroughly understand the needs of agriculture and who have vision must be selected to represent the farmers at the national capital. We have many farm organizations, perhaps more than needed, but so far not one of them has been organized on a sufficiently broad basis to care for all the activities of the industry of agriculture. The National Board of Farm Organizations is a step to unite the farm organizations that they may act as a unit.

BRIGHT FUTURE FOR DAIRYING

Some of our dairymen are more or less discouraged. The prices of dairy products have failed to advance as rapidly as the prices of other farm products. There has been, too, the shortage of labor, which has caused them to work long hours and this in itself is likely to bring periods of depression and lead to discouragement.

It is our belief, however, that the prospect for the dairy industry is brighter than it has been in many years. As soon as the war is over there is going to be an unlimited demand for dairy products and a good demand for dairy cattle. We believe the dairy farmer who starts breeding his cows to a pure-bred dairy bull will reap a good reward in the future. The man keeping scrub cows will not gain the same profit as the man keeping the high-producing animals.

There is going to be a large demand for good grades and pure-breds. In a personal letter to us, Commissioner E. S. Brigham of Vermont, who is devoting one-half of his time to the Food Administration, makes the following statement:

"It seems to me that the outlook is very promising for the dairy industry and that prices will materially advance before the season is over because of the great demand from abroad. The cost of production will, of course, very materially increase because of the shortage of fodder and feeding grains. Labor is also bound to be very high in price. Whether the net return to the purchaser will be much greater is a question because of advanced costs. I look for conditions to be very favorable in the future for the dairy industry."

We can well afford to heed the prophetic judgment of Mr. Brigham for he is in position to have a clear understanding of the demands abroad for dairy products and dairy cattle, because of the position which he holds in the Food Administration.

Grinding Oats—Frosted Corn

We are paying $40 per ton wholesale for soft wheat bran and $45 if you get it from the grocery store. Oats here sell for $1 per bushel. We are very anxious to substitute oats for corn in our winter ration, as we believe it will be almost impossible to secure corn, but we are unable to get the oats crushed. Will feeding them whole injure the cattle? How would you mix a ration, to feed with clover hay and silage, from wheat bran, oats, and cottonseed meal? If you could get corn bran at $30 a ton to mix with this would it pay? Will frost bitten corn hurt cattle? I think we'll have a lot of it.

Paragould, Ark. H. FARM.

Especially with high producing cows there is a considerable advantage in crushing oats. We do not know that it pays better to grind oats than simply to crush them, but believe that when cows are working their bodies sufficiently hard to make a heavy flow of milk it is expensive to require them to grind the oats themselves. There is no danger of injuring cows from feeding whole oats, and good returns will be received from including oats in the ration, although the cows will hardly make as economical use of them as though they were ground

or crushed, wasting, according to experiment findings, as much as 20 per cent of the nutrients contained in the oat kernel.

With clover hay and silage, a splendid basis for an economical dairy ration is had. We would feed clover hay in as large quantities as will be consumed and would supply silage in addition at the rate of about thirty pounds per cow per day, varying this somewhat with the size of animal. A mixture of 300 pounds oats, 200 pounds bran, and 100 pounds cottonseed meal will give fairly satisfactory results, if fed to heavy producing cows at the rate of one pound for each 3½ to 4 pounds of milk produced. High testing cows should have a somewhat more liberal supply, perhaps at the rate of one pound for each 3 to 3½ pounds of milk produced. This grain mixture would be considerably improved by the addition of a high carbohydrate concentrate such as corn, barley, or ground barley. If one of these feeds can be secured at a price which compares well with the cost of other concentrates, it will pay to include one of them in the grain mixture, making the mixture of 300 pounds of one of these feeds, 200 pounds oats or bran, and 100 pounds cottonseed meal.

Whether corn bran will suit the purpose better than wheat bran depends upon the cost per ton. The difference here quoted makes the purchase of corn bran more economical than that of wheat bran. Corn bran is somewhat lower in feeding value than wheat bran though it fills the same place in a general way in the ration.

There is no danger that frosted corn will hurt cattle unless it is allowed to mold and form poison from this. If it has a good appearance and does not develop mold which is noticeable it can be fed with safety.

Age for Vealing Calves

At what age may a calf be butchered for veal? What laws, if any, are there regarding the interstate shipment of veals? I have been told they must be six weeks old, but if I can sell them younger, I believe it would be more profitable.

Has the Food Board ever made any rules regarding veals? I think not myself, but there is such a general opinion to the contrary here, that I would like to know the truth. One butcher told me that he was not allowed to butcher veals. I told him I thought it was queer as they were quoted on the city markets at good prices.

Aurora, Mo. O. G. R.

The U. S. Department of Agriculture has oversight of the interstate shipment of meat animals and it does not prescribe the age limits for veal calves. It does, however, provide that calves, pigs, etc., too immature to produce wholesome meat shall be condemned as unfit for human food. Carcasses are considered too immature when the meat has the appearance of being water-soaked, is loose, flabby, tears easily, and can be easily perforated with the fingers; when its color is grayish red or good muscular development is lacking; or when the tissue about the kidneys is dirty yellow or grayish red, tough, and intermixed with islands of fat.

It is ordinarily not found profitable to feed veal calves, particularly dairy veals, for over four weeks, and we are under the impression that calves of a younger age are accepted on the markets. However, the determination is largely based upon the size of the calf and we are informed by local shippers that the market will not accept, as a rule, veals under 50 lbs. weight. This is not live weight but represents the carcass, including hide, etc.

Our reports from the Chicago market show that in 1917 the average live weight of the veal calves received was 137 lbs.,—the average price paid for these being $13.75 per 100 lbs. In March, 1918, the average weight was 148 lbs. and the average price $15.50 per 100 lbs. The range in weights of veals from dairy districts was from 90 to 130 lbs. In June, the Chicago market reported an average weight of 139 lbs. and an average price of $15.55 per hundred. These, of course, are the prices paid at the stockyards and regular shippers doubtless paid somewhat less than this.

We are not advised as to the particular laws governing the sale of veals in Missouri but those states having laws, as a rule, forbid the sale of veal calves under 4 weeks of age. Should further definite information be desired, it may be secured by writing the State Commissioner of Agriculture at Columbia and the State Food Administrator at the same place.

There are no laws or regulations forbidding the sale or killing of veal calves of proper age. These have been proposed from time to time but none of the men proposing these have been able to put them across. However, there is an attempt being made to discourage the vealing of heifer calves as it is felt that there is a large demand for these animals and the future of the cattle business is dependent upon saving them. However, it would be a foolish and well nigh unenforcible regulation to attempt to prohibit the killing of veal calves. We have commented upon this matter on various occasions, at which times we have gone into some detail as to the impracticability and absurdity of any such regulations.

Cottonseed Meal vs. Oil Meal

The price of cottonseed meal has been fixed at $53 f. o. b. mills in Arkansas, Alabama, Mississippi, and Georgia. This makes it figure about $63 Boston rate.

According to Henry and Morrison a good grade of oil meal contains about the same amount of digestible protein as good 36% cottonseed meal. The oil meal contains 140 lbs. per ton more of digestible carbohydrates, which is equal in feeding value to the digestible nutrients from three or four bushels of corn.

The present price of oil meal figures out about $60 Boston rate. Therefore, you might say that the oil meal gives at least $6 more feed value for $3 per ton less money.

It looks like cottonseed meal is due for a decline to us to make it more in proportion with other feeds. What do you think about this proposition? What do your readers think of it?

Ohio. D. Bros.

So far as chemical analyses are concerned, it may be stated that prime cottonseed meal and oil meal have practically the same feeding value. There is a difference, however, in the properties of these feeds, and which is not measured by chemical analysis.

It is our belief that a feeder can afford to pay more for oil meal than for cottonseed meal when there are no succulents such as silage or roots to form a portion of the cow's ration. When there is silage it does not make very much difference whether the feeder uses cottonseed meal or oil meal, but we would prefer oil meal if we could obtain it at the same price, even to use with succulent feeds. Where there is nothing but dry feeds, we would pay several dollars more per ton for oil meal than cottonseed meal, because oil meal has a laxative effect upon the animal's digestion.

We are satisfied that feeding experiments have not yet determined all the qualities of oil meal, but we do know from practical experience that it is a most excellent feed for dairy cows. If an animal is run down, out of condition, so to speak, and given a little oil meal regularly it will usually show its effect in a very short time.

Neither oil meal nor cottonseed meal should be fed in large quantities, that is, not more than two pounds per cow per day to obtain the best results. We appreciate there are instances in the South where 6 to 7 lbs. or more are fed daily to an animal, but we are satisfied that with such amounts the best results are not obtained.

Whether the price of cottonseed meal will be any lower than at present we are unable to say. We must bear in mind that there is a shortage of feed and it is quite possible that cottonseed meal will be picked up at the price stated in this letter, even though oil meal can be purchased a little cheaper at the present time. The chances are that the price of oil meal will advance to be on an equal basis with cottonseed meal. It is our opinion that our readers would prefer oil meal to cottonseed meal at the same price and many of them would pay a little more for it. We are willing, however, to let them answer for themselves.

Best Milk Utensils Metal

Can you give me any data in regard to the use of different metals as milk containers, especially tin and aluminum? Is it equally as safe to use one as the other, and does any chemical action at all take place when milk is allowed to stand in either one? I understand that at a recent dairymen's convention, this question was discussed, especially in regard to aluminum and if it is possible I should like to have some definite information on the subject.

Pittsburg, Pa. M. H. W.

Aluminum has some advantage over tin as a material from which containers for milk are made. Aluminum does not rust and is easily kept clean. Also, the fact that aluminum vessels are made without the seams, which appear so commonly in tinware, is an advantage.

However, if a tin vessel is kept clean and if it is made without seams, which are most difficult to keep clean, it is fully as satisfactory as aluminum. If the tin is allowed to rust, which happens frequently when it is not given the proper care, it would, of course, be much less desirable as a container for milk. Also, if milk is allowed to become sour in tin containers the acid formed may have a slight effect on the metal. We judge this action under ordinary conditions to be unimportant in its relation to the milk itself.

We have no statistics on this subject but believe that so far as any chemical action with the two metals is concerned, one will be as satisfactory as the other. An advantage goes to aluminum, however, in the matter of cleanliness and also in the matter of durability.

Supplementing Skimmilk for Calves

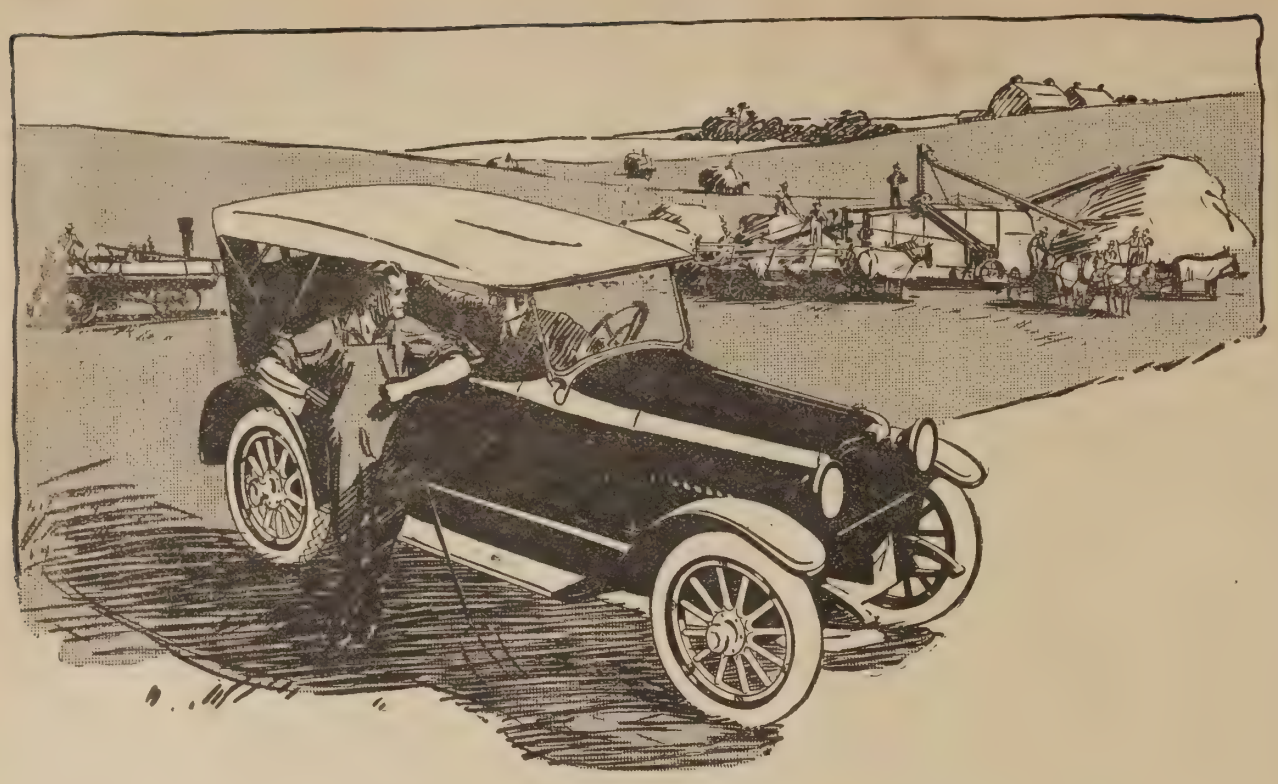
I am raising several calves on skimmilk. Please advise me what is best and cheapest to put with the skimmilk to take the place of the butterfat taken from the whole milk.

Sherman, Mo. A. L. R.

In addition to skimmilk it is customary, in many cases, to feed young calves ground flaxseed, starting with one teaspoonful at each feeding and gradually increasing to not more than a tablespoonful. This is fed in addition to the hay and regular meal mixture, and is intended to replace the butterfat taken from the milk.

On Hoard's Dairyman Farm we are feeding according to the following plan: Calves are left with their dams for the first two or three days, or longer if the dam's udder is inflamed. We feed whole milk until the calves are two to four weeks old and then gradually change to skimmilk. There are some feeders, however, who discontinue the whole milk at two weeks of age. Choice alfalfa or clover hay is kept where the calves can obtain it and also either whole oats or a mixture of whole oats and shelled corn is supplied where they may have access to it at any time. After the calves are weaned, the grain is ground, using either corn and oats in equal parts, oats alone, equal parts of corn, oats, and wheat bran, or a mixture consisting of three parts corn meal, two parts ground oats, and one part oil meal. The amount of whole milk fed depends on the individual calf's ability to take care of it, and the strong, vigorous calf is put on skimmilk at two months of age. With each feed of whole milk a cup of hot water is given. Skimmilk is fed as long as available, and we seldom stop until the calf is at least six months old.

It will be found that calves even as young as two weeks old commence to nibble the hay and they will soon commence to eat the oats. These, however, should never be soaked or fed with the milk. To a certain degree it does not seem logical to feed young calves whole oats or corn, but actual experience leads most men to prefer feeding in this manner. After the calves get where they consume quite a bit of this feed, it is found preferable to feed twice a day all the whole grain they will clean up readily and later, say at 6 months, change to the ground feed or the regular ration that is being fed to the cows.



Rye for Cows and Hogs

Have a quantity of rye that I would like to know whether to sell at $1.55 per bushel or feed to hogs or dairy cattle. Hogs are selling at $.24. Do not have any skimmilk to feed so would have to buy tankage or middlings at the government price.

North Jackson, O. R. W. A.

Whether it will be economical to feed this rye to hogs and cows depends, of course, upon the cost of other feeds. We calculate that rye at the price quoted would be worth about $53 per ton. In feeding either cows or hogs it would be found somewhat less valuable than corn, though it is about equal, pound for pound, to barley. In feeding cows the allowance should be limited to a supply not greater than two or three pounds rye per cow per day, since heavy feeding of rye causes the production of milk from which hard, dry butter is churned.

In feeding hogs or dairy cows, rye should be used in a mixture of grains rather than fed alone. If the hogs can be run on an alfalfa or clover pasture and fed skimmilk in addition, rye will do very well. Otherwise, it should be fed with some such feed as tankage or meat meal, or should be combined with ground oats in order that the percentage of protein may be increased somewhat. Rye may be fed in addition to a liberal supply of a legume hay or abundant pasturage, in a mixture with other grains, such as ground oats, or wheat bran, and a high protein concentrate. Such a mixture might be made by using 200 lbs. ground rye, 200 lbs. ground oats or bran, and 100 lbs. cottonseed meal or oil meal at the rate of one pound for each three to four pounds of milk produced.

The Most Beautiful Car in America

"The Twilight Army" and the Motor Car

Perhaps, you yourself are a Soldier in the "Twilight Army." On hundreds and thousands of farms the "Twilight Army" has been helping to harvest the crops, to fill Uncle Sam's Granaries, to feed The Boys "Over There."

They closed the stores in thousands of little towns at four o'clock every afternoon, and everybody went out to the harvest fields to work—until it was too dark to work longer. And it was the Motor Car, thousands of Motor Cars, that gathered and marshalled and transported from town to field and back to town that huge army of soldier-harvesters. So have you and the "Twilight Army" solved the Food Problem for Our Boys and Our Allies.

Can you think of a better demonstration of the indispensable utility and all-round efficiency of the Motor Car than this? General Joffre won the First Battle of the Marne and saved Paris with the Motor Car. And you and your "Twilight Army" and the Motor Car have, as Hoover prophesied, helped "Food to Win the War."

It isn't necessary, therefore, to tell you what the Motor Car means to make your crops profitable, to make your time count, to help Win the War. It is the well-designed car, the well-built car. the dependable car, the economical car, the car with reputation and character back of it that means the Preferred Investment. Such a car is the Paige.

Liberty Bonds as Insurance

HOARD'S DAIRYMAN:—From the standpoint of the farmer the investment of his money in Fourth Liberty Loan Bonds to the extent of his financial ability is a measure of insurance and future safety, the benefits of which can hardly be exaggerated.

In some sections of the country this year weather conditions made the production of profitable crops an impossibility. The fact that prices for all farm products have been very high made the crop losses easier to bear, but unquestionably crop failure was a serious setback financially to the farmers in many cases.

Suppose in years past these farmers, who have witnessed their farm dividends melt away under the scourge of drought or hot winds, had invested their money partly at least in United States government bonds on which they would now be drawing income. Would this not be now a welcome addition to the farm income?

As a general proposition the farmer has his entire investment tied up in his farm property. Generally speaking, the farmer as a bondholder or stockholder is a negligible factor.

In buying Fourth Liberty Loan Bonds now he will be insuring himself against crop failures in the future. He will not have all of his eggs in one basket. In a much larger degree than ever before he will be independent of temporary crop losses. With the government paying him an income he will not be obliged to borrow money at high rates to tide himself over such periods.

Where this year the crops have been good and the returns large, due to exceptionally high prices, unusually large subscriptions should be made. They should not only be sufficient to raise the quota allotted to any such district. The quota should be oversubscribed as soon as the bonds are placed on sale.

In districts where the returns have been less favorable, there will be the necessity for the farmers, nevertheless, to strain every nerve to raise their quota. This may entail greater sacrifice than in other sections, but no one will be exempt from doing his duty, and the future income and future safety will more than compensate for temporary inconvenience, while every subscriber will know that whatever his apparent sacrifice it will be small indeed compared to the sacrifices demanded from and given by the fighting men of the nation.

Share in the great work of winning victories for the nation, and also by subscribing for Fourth Liberty Loan bonds; take out the best kind of insurance in the world.

Because the casualty lists are adding to the gold stars in the service flags in every neighborhood; showing how trivial the financial sacrifice is compared to the sacrifice of those upholding the nation's honor with their very lives.

Because it is the plain duty of every American citizen and no farmers are shirking their responsibility, whether it is in giving their boys to the army and navy, furnishing the food reserves for the allied world or in subscribing to the limit of their financial responsibility to Fourth Liberty Loan Bonds.

Illinois. GEO. A. KING.

National Dairy Council Meets

The annual meeting of the National Dairy Council has been called for Columbus, Ohio, October 14 at 10:00 a. m. by President M. D. Munn of St. Paul. The meeting will be held in connection with the National Dairy Show which will be in progress at that time and will be held at the convention hall of the exposition grounds.

Oregon Dairy Council

HOARD'S DAIRYMAN:—The serious condition of the dairy industry in the state of Oregon led to the formation in August of a volunteer organization known as the Oregon Dairy Council. The president is O. D. Center, head of the Extension Department of Oregon Agricultural College. The chairman of publicity is W. K. Newell of the Food Administration; the secretary, E. C. Calloway, city milk chemist of Portland. The men of this council after organizing went to work immediately to look for ways and means whereby they could save the dairy industry of Oregon. The feed was scarce and labor dear and the dairymen were getting discouraged and were killing off their cows. The health of the children was menaced.

They commenced by working diligently on a campaign of dairy education. The people soon commenced to respond by using more milk and the dairymen began to sit up and take notice that some one had become interested in them. The farmers of Hermiston got together and bought a whole carload of fine Jerseys. We will feed these this winter, they said, and when the spring comes we shall reap our reward. The far sighted farmers saw that a cow fed even though at a loss is a better investment than a cow killed for so much beefsteak. The Oregon Dairy Council's educational campaign is progressing splendidly. The educational director has secured the co-operation of the public schools and had a week's program September 16 to 21 in which the children wrote essays, heard lectures, and were told interesting stories about the value of milk as a food.

The Food Administration has cooperated generously and the state Dairy and Food Commissioner and Bureau of Health have given their assistance. The head of the Home Economics Department of the great Oregon Agricultural College, Miss Eva Milam, has urged the encouragement of a greater use of milk, asking all her county chairmen and assistants to have a share in the work. The girls' polytechnic school has given special attention to teaching milk recipes. The women's committee of the Council of Defense and the Oregon Federation of Women's Clubs have given their endorsement and support.

A prominent dairyman said of the work, "I will try to encourage the dairymen to keep their cows alive. I shall not kill mine so long as I can get a bit of feed. Milk means life to the nation. We never could have sent forth such a fine army to fight the Hun if it hadn't been for milk. Kill the cows now and the future generations are doomed." Albers Bros., one of the leading feed and hay houses, say there is plenty of feed but it is high priced and the dairymen, if they pay high prices for feed, must get good prices for milk and the people must realize that.

The Oregon Dairy Council financed an educational exhibit at the state fair at Salem, showing the food value of milk. Dr. E. J. Labbe, just back from Europe where he helped in the feeding and care of hundreds of Belgian refugees, was the Dairy Day speaker on Sept. 24th. The next night C. F. Lareen of North Dakota, and W. I. Pew of Iowa, spoke.

Oregon. E. H. HOLMES.

Reason for Sugar Shortage

The shortage in sugar in the United States is due to the fact that we must supply our allies from what was formerly almost the exclusive supply for this country.

Before the war, Germany, Austria, Belgium, and Russia were large exporters of sugar, and each country in Europe got almost its entire sugar supply from European sources.

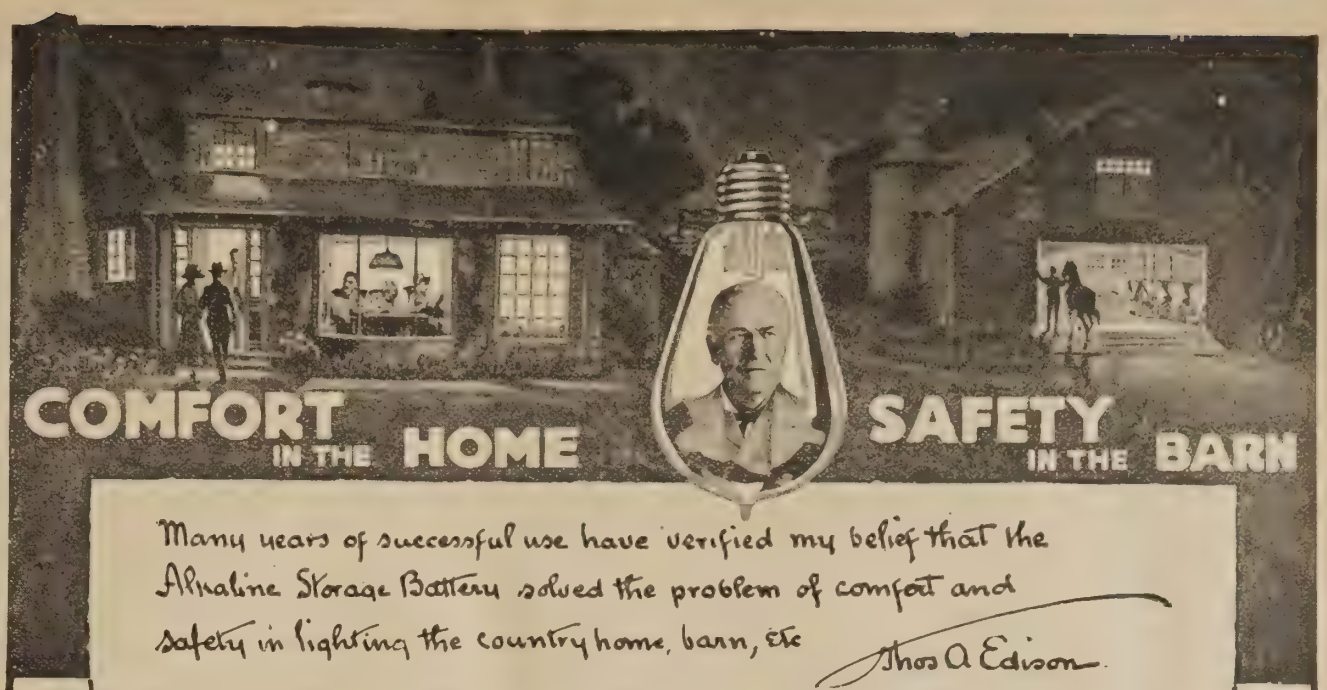
Since the war, Germany and Austria have ceased to export sugar and the sugar factories of France and Belgium have been entirely destroyed by the German army. The result is that the sugar produced by Cuba, the West Indies, and Hawaii, together with that of the United States, has now to be divided with our allies instead of all being consumed in the United States.

Sugar is one of the most essential foods for the soldiers, and we feel that after this brief explanation there is no true American that will not be willing to limit his sugar to two pounds per month as requested by the Food Administration in order to enable them to send sugar to our own soldiers and our allies.

How much sugar per month is each person allowed?

Two pounds per person per month.

How much sugar may be purchased at a time?



To city or village customers two pounds at a time. To country customers five pounds at once.

How may sugar be obtained for canning purposes?

Permits must be obtained by purchaser from county food administrator or local deputy. Maximum amount to be sold at one time is ten pounds. Further ten-pound allotments may be granted by local deputy or county administrator to can fruits actually in hands of consumer.—WISCONSIN FOOD ADMINISTRATION.

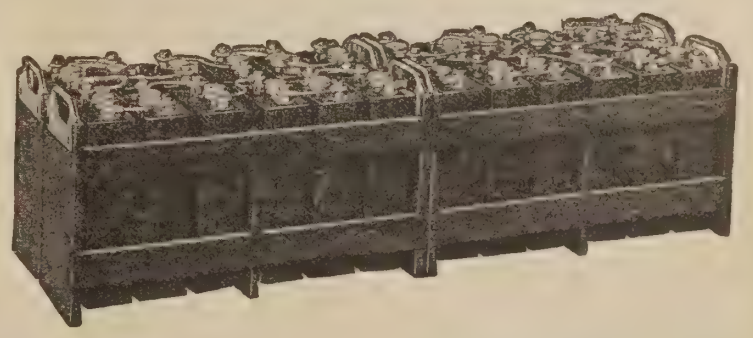
Legume hays.—The cheapest source of protein is generally legume hays, including clover, alfalfa, and cowpea hay. If an abundance of any one of these hays is on hand, the problem of making an economical balanced ration is very much simplified. The use of these hays makes it unnecessary to buy any large quantities of bran, oil meal, or cottonseed meal for ordinary dairy cows, and makes it possible that the principal grain used be corn, which usually is our cheapest grain. Even cowpea or alfalfa hay alone, with corn for grain, makes a fairly good ration for an ordinary cow, and such a ration could be substituted with good results for that of timothy hay and corn fodder. If hay is to be sold it should be timothy hay and not clover or cowpea hay.—C. H. ECKLES.

Conservation is the All-American job—an army of four million soldiers must be fed from this year's crop.

When you decide to install an Electric Power and Light Plant, ***be sure to get the Edison Alkaline Storage Battery.***

There are many excellent electric plants to be had. Practically ***any*** of the reliable makes can be purchased with the Edison Storage Battery, when specified. Several highly efficient plants are regularly supplied with the Edison Battery. We emphasize:

YOU CAN SPECIFY AND SECURE THE



EDISON STORAGE BATTERY

WITH *ANY* RELIABLE POWER AND LIGHT PLANT

Remember that the Storage Battery is the "heart" of the plant. It must be dependable for service 24 hours every day. No matter how good the engine, generator, and switchboard may be, you cannot be certain you have the ***right*** plant for your home ***unless*** it is equipped with the Edison Storage Battery.

The Edison is the only battery built entirely of steel—rugged, easy to operate, hard to wear out. In fact, it can be used year after year with no expense for repairs or replacement of parts, and needs no attention other than adding a little distilled water occasionally. *That* is the kind of battery *you* want!

Ask the Dealer. If he will not supply an Edison Storage Battery with the power and light plant he has to sell, write us at once and we will put you in touch with a dealer who will.

EDISON STORAGE BATTERY CO., 262 Lakeside Avenue, Orange, New Jersey

Start Your Moulted Hens to Laying

THE world is calling for more poultry and more eggs. Everybody must speed up—it's a patriotic duty. Now's the time to get ready for regular fall and winter laying.

DR. HESS POULTRY PAN-A-CE-A

Will start your pullets and moulted hens to laying promptly

Remember, going through the moult is like going through a long spell of sickness. The egg organs become dormant, but why let nature bide its own time to revive the egg organs? Feed a tonic.

Dr. Hess Poultry Pan-a-ce-a contains *Nux Vomica* and *Quassia*—tonics that promote digestion, that tone up the dormant egg organs. It has *Iron* for the blood, and *internal antiseptics*. This combination will keep your whole flock healthy and start your pullets and moulted hens to laying.

IMPORTANT: If your hens are not yet over the moult, supply them with Pan-a-ce-a daily to give them strength and vitality to force out the old quills and grow new feathers. Always buy Pan-a-ce-a according to the size of your flock—a penny's worth for each hen to start with. There is a package for all sizes of flocks.

You have no chances to take. The dealer in your town who sells Pan-a-ce-a will refund your money if it does not do as we claim. 30c, 75c and $1.50 packages; 25-lb. pail, $3.00; 100-lb. drum, $10.00. Except in the far West and Canada.

Dr. HESS & CLARK, Ashland, Ohio

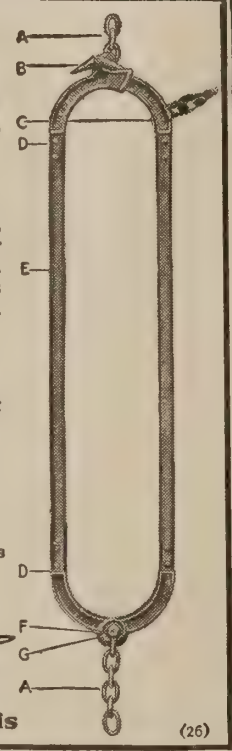
Keeps Hogs Healthy
Drives Out the Worms



Dr. Hess Instant Louse Killer Kills Lice

Porter's Stanchion

Cow-Proof, Durable, Comfortable

Here is the ideal cow-stanchion, made by Porter with the Porter experience and guarantee behind it. It combines all good qualities that possibly can be put in a stanchion.

Porter Points See Them in the Picture

A—Chains at Top and Bottom give maximum Flexibility
B—Locked by "Cow-Proof" Latch.
C—Stanchion holder regularly furnished with each Stanchion.
D—Perfect Fit and Smoothness make joints Sanitary.
E—Round tubing prevents injury to animal.
F—Extra large bearing surface at hinge insures long life.
G—Clevis and bolt hold hinge firmly in place.

Porter's Stanchion makes for "Comfortable Cattle" and that means more valuable herds.

The Cow and Machine Milking

(Continued from page 327)

part of the udder that hangs low usually gives the most milk and the part hanging high usually gives the least. The portion of the udder that hangs high carries the greater part of the weight of the teat cups. Weight applied to the teat cups causes the cow to milk out quicker. This means then that one portion of the udder will milk out quicker than the other. At times this may cause the teat cups to fall off. The skin of the empty part of the udder may fold, air may be let in, and this may cause all of the cups to be released.

It is evident that the length of the rubber tubes could be adjusted so that the weight on all of the four unevenly placed teats would be the same, but this would mean a change of tubes or cups each time such a cow is milked.

In addition, the empty part of the udder may be affected by the suction and pulsation. When a cow is being milked, and she is giving down her milk properly, the mammary organ is relaxed. So far as known, the cow cannot close one part of the udder and relax on the other part. If a cow has milked out entirely on the fore quarters, and not on the hind quarters, the suction or vacuum applied to the front quarters probably extends through the teat, the milk cistern, the ducts and vacuoles, to the gland lobules, and even to the alveolan cells. With some cows, especially the easy milkers, this long applied vacuum on the empty portion of the udder may be injurious. The probability is that if discomfort is caused to the cow, she will either have udder trouble in the empty part of the udder, or else she will tighten the muscles and shut off the upper part of her udder from this suction. This probable action of the cow would cause her to hold up her milk in the quarters that milk out last.

Again, there are cows having teats of uneven size and shape, and teats of poor quality. While it is true that there are very few cows having so abnormally shaped teats that the machine cannot milk them, with the aid of the right sort of an operator, it is also true that cows having well shaped and medium sized teats are easier to milk by machine and the teat cups are much easier and quicker to attach properly.

When teats are of proper size and shape, the milking machine gets a straighter and better hold, and there is probably less danger of having sore teats. In all the time that these different milking machines have been in use, there have been only three different cows that have been troubled with sore teats that could in any way be laid to the milking machine. These teats became hard, red, feverish, and a trifle swollen at the end. This soreness was probably due to a congestion of the blood caused by the steady suction. This soreness lasted but a short time. It gradually disappeared without removing the milking machine. It is possible that the quality of the teat may have been a partial cause of this trouble. These teats were naturally inclined to be a little hard and fleshy in consistency.

Usually a herd of cows would contain only a few cows that would be undesirable for mechanical milking from this standpoint. Minor difficulties in machine milking would be obviated if such cows were culled out.

Cows Well Adapted to Machine Milking

Cows that have the right nervous temperament, that give a large flow of milk, that give down their milk readily and quickly, that have symmetrical udders and squarely placed teats of proper size, are especially suited for machine milking. In the college herd, there are about 30 out of 40 cows that would come under this head. It is reasonable to assume that this herd is normal.

In the average dairy herd there is probably a similar percentage of cows that would give no difficulty at all in machine milking, if a prudent operator had charge of the machine.

In a herd composed largely of scrubs or unimproved types, and of range cattle, the percentage of cows that will milk successfully with the milking machine would undoubtedly run much lower.

From a commercial standpoint, the success of a milking machine is judged not so much from the large number of cows that will milk successfully, as from the small number of cows in the herd which cause the difficulties. If three or four cows in a certain herd appear to give a full flow of milk at one milking and a small flow at another, or if the teat cups fall off from one or more of the cows, or if one or more of the cows have caked udders, or if some of the teats are hard and sore at the end, or if a few cows go dry three or four months previous to freshening, the milking machine is likely to be blamed. It pays to eliminate the unsuccessful cows and have the herd composed of cows that normally give no trouble for machine milking.

Select and Breed Right Kind of Cows

The dairyman who expects to use the milking machine in his herd and use it successfully should realize that the kind of a cow is an important factor in making mechanical milking a lasting success. If there are cows in the herd that are defective in any or all of the above mentioned points, the owner should not expect the milking machine to be the greatest success. Such defective cows as a rule are not good appearing cows. They, as a rule, are not large producers and profitable cows. They should be culled from the herd.

If such cows are kept in the herd, their offspring should not be continued, especially if these defects and habits of giving down milk prove to be a dominant character and are transmitted to the progeny.

One of the most important things, in this connection, is to use great care in selecting a herd bull. The wise dairyman selects a bull that comes from large producing ancestors, that is of pure blood and of good type. In addition, the female ancestors should have good, nervous temperament, should have well shaped mammary organs, and should milk well. The male ancestors should be known to have daughters having milking characteristics that are suitable for mechanical milking. A tried sire known to put good mammary organs on his daughters is a good acquisition in a herd.

By thus applying care in this selection and breeding of the herd, in a short time there will be none of the cows left that cause the chief difficulties in the successful operation of a milking machine.

I have elaborated on the above points because they are important in the successful operation of a milking machine. In addition, the barn should not be too cold, and conditions for keeping the milking machine sanitary should be reasonably convenient.

Machine Milking for Nine Years

The milking machines in the South Dakota State College dairy barn have now been in constant use for more than nine years. As the time of usage increases, difficulties in mechanical milking decreases. This is due chiefly to three things.

First, the various manufacturers of milking machines are constantly making improvements and the South Da-

kota Experiment Station has had the immediate advantage of these improvements.

Second, the ability of the herdsman to successfully operate the milking machines improve. The present herdsman has been on the job eleven years, longer than have the milking machines. Milking is like anything else. The longer a person is at it the better he becomes. However, there are some persons who seemingly never can learn to milk by machine, the same as there are some persons who cannot learn to play an instrument properly. A successful musician is always in close touch with the sound of the instrument. An operator of a milking machine must understand and be in close touch with both the cow and the machine.

Third, the udders, teats, and suitability for mechanical milking of the cows in the herd have greatly improved during the last few years.

At the present time when labor is so uncertain and scarce, we could not dispense with milking machines. In case of necessity one man can milk all of the cows by machine, but he could not do so by hand.

Value of Shredded Fodder

HOARD'S DAIRYMAN:—The problem of providing roughage for winter feeding is one that concerns farmers who keep a good deal of live stock.

SHREDDING FODDER INTO BARN

The necessity of keeping and feeding live stock is shown in every report of the food conditions in this country and abroad. Next to hay, corn fodder is one of the most abundant roughages produced in the corn belt, and perhaps has never been utilized to as good an advantage as it should be.

While stover has not a high feeding value, it is an excellent dry roughage to feed with silage. Its feeding value may be improved by shredding the fodder into the barn. Feeding fodder or the whole stalk has always been a popular practice, but it is not possible to utilize so much of it as when shredded. Not much, if any, more labor is required to shred fodder than to get out each day or so during the winter months and haul in a load for the stock. When it is shredded into the barn it does not deteriorate in quality near so fast as when standing out in the weather.

I have heard old-time farmers say that better results could be obtained by feeding from the shock, but I always found that the same men recommended putting their hay in the mow in preference to shocking it in the field.

The quality of fodder depends somewhat on the time of cutting the corn. The leaves are a valuable part of the corn plant. If the corn is let stand until they have become quite dry many will be lost through shattering; also the stalks will contain more indigestible fiber than when cut when the corn is fully matured. Corn that is cut when it is glazed or mature and set in moderately sized shocks will cure nicely even though it carries a lot of green leaves.

We use a corn binder for cutting, finding the bound bundles convenient to handle. If we had had to depend on hand cutters last year it would have been impossible to get any cut at all. The binder cuts the cornstalk near the ground, and if the corn is cut at the right stage the butts make as good feed as the upper part of stalk when cut fine.

The best time to shred is as soon as the fodder is well cured. Fodder that stands in the field until January usually becomes very hard and dry, so that when it is shredded it pulverizes considerably and does not make the best feed. From October to the middle of November it is usually in prime shape to shred, and the corn husked from it by the shredder is dry enough to crib safely. If the fodder is a little damp when shredding, due to a damp atmosphere, we throw over it while shredding a mixture of lime and salt, mixed in the proportion of 1 of lime to 3 of salt, using about two or three gallons of the mixture to a hundred shocks. This prevents mold and does not depreciate the palatability, but the fodder should not be disturbed until through heating.

The labor required for shredding is about equivalent to that for siloing. Since so much labor has been drawn from the country the best means of meeting the shortage will be found in six to eight farmers owning co-operatively a small shredder. Scarcely a neighborhood will be found in which there is not a light tractor of some sort to operate it. In this way very little hired labor will be needed, while if a large capacity custom outfit is hired it will take a large crew to keep it going steadily.

Our ring has owned one of these small shredders for a good many years, and usually not more than two to four men were hired outside of the labor on the eight farms, there being eight in the ring. Usually the work is all finished before Thanksgiving. The cost of shredding has ranged near what it would cost to shuck the corn from the stalk by hand, and the shredder husks the corn as well as shreds the fodder into the barn.

Indiana. J. L. JUSTICE.

Moves Cattle from Drouth Areas

Large shipments of cattle from the drouth-stricken regions of Texas and Oklahoma to pasture land in Pennsylvania, Virginia, and other eastern states are to be undertaken by the railroad administration, upon request of the Food Administration. To make possible this food conservation measure a decrease of 25 per cent in freight rates has been granted, through recommendation of the Food Administration.

Cattle buyers in the East will purchase western stock outright, and shipments in trainload lots will begin as soon as the plan is completed.

Bonds speak louder than words.

CARBIDE GAS lights this farmer's home (and barns) and cooks his meals—safely, quickly, economically.

It is rendering this double service in over 250,000 country homes today. The farmer was the first to discover the value and use of Union Carbide, eighteen years ago.

Following its widespread use by the farmer, the miner discovered that Carbide miners' lamps were a great improvement over oil lamps. Today over 700,000 miners use Carbide.

Metal workers and machinists in shipyards, on railroads, and in machine shops discovered they could weld and cut metals quicker and more economically with Carbide gas (when combined with oxygen) than by any other method.

Contractors, stevedores, and farmers found out its superior advantages for flare lamps and torches.

These are some of the uses that nave made Union Carbide a big factor in all branches of industry.

100 Ayrshires—Both Sexes For Sale

To make room for our young stock we are forced to dispose of approximately 100 head. We are offering animals of all ages and both sexes for sale. These cattle are backed by Advanced Registry Records, they represent popular blood lines, and many of them were show ring winners in 1916 and 1917. They are priced right. Write for further information to

H. F. PAZIK, WAUKESHA, WISCONSIN.

Death of Calf

I had two sick calves some time ago, one of which died. The other is still sick, not changing for better or for worse. The local veterinarian says they may have been poisoned by a weed. I have looked all over my pasture but failed to find any such weed. Whenever it rains there is a pool of manure water in my barnyard. The calves were observed to drink some of this water. In your opinion would this cause the sickness or death of the calves?

Gillett, Wis. G. S.

The post mortem lesions strongly suggest hemorrhagic septicemia as the cause of death and it would be well to have remaining cattle vaccinated against that disease. Meanwhile give them a change of pasture. If another animal dies the veterinarian should pack samples of affected tissues in cracked ice and sawdust, without a disinfectant or preservative, and send them to the veterinary department of the State Agricultural Experiment Station at Madison for examination. "Manure tea" would not be likely to cause the lesions described.

Don't Keep and Feed A Barren Cow

But Make Her Breed by a Thorough Treatment with

Hood Farm Breeding Powder

Success is Practically Certain.

Hood Farm Breeding Powder is really

A Marvelous Preparation.

It restores the reproductive functions.

It corrects the irregularity of cows and heifers that do not come in season.

It removes the irritation and restores the organs to normal condition in cows that are constantly in season.

It is antiseptic, soothing and healing.
It does NOT harm a cow or heifer.
It does NOT cause straining.
It is easily procured, easily administered, AND ECONOMICAL.

Order today, mentioning this paper.

Prices, prepaid, $1.15, $2.75 and $5. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

The Business End of a JERSEY

THE business end of a Jersey is the udder. It's a money-making machine. One of the marvels of nature. Automatic and sure! The Jersey does not adulterate her own milk. She gets the utmost nutriment from the least feed. She gives it to you in milk richer in butter fat than that produced by any other breed. Hundreds of farmers who started with one Jersey now have herds bringing them a continuous income that makes them independent of crop conditions. The facts about Jerseys will surprise you. We send them FREE. Write to breeders for prices and pedigrees.

THE AMERICAN JERSEY CATTLE CLUB 351 West 23rd Street, New York City

More Dairy Herds for Texas

HOARD'S DAIRYMAN:—Many farmers of Texas are deeply interested in the plan which has been devised by the extension service of the State Agricultural and Mechanical College, College Park, for providing them with dairy herds. An announcement of the plans says:

"Those needing or preferring Jersey stock can best have their wants supplied from the Texas herds. The Guernsey and Holstein animals will be shipped down from the north during the cooler weather. Expert judges will be furnished by the Extension Department of the college and their services will be free.

"The plan is to buy enough for a car lot shipment to Texas common point rates places, and then distribute individual shipments from there. The cattle will go to the buyers at actual cost, which will include price paid for the stock, and a pro rata part of the expense for freight, feed bills, and the traveling expenses of the expert judges of the value of the cows as dairy purpose animals. Car lots will require at least twenty head for the more mature cows, 25 head for two-year-olds, and 30 for the yearling heifers.

"In districts where the fever tick prevails the cattle will first have to be immunized, either at starting point or better still shipped direct to the Agricultural and Mechanical College. They will be inoculated there free of charge, except for the cost of care and feed while here. For those districts only young stock, not over sixteen months old, should be purchased, even though they are to be sent to the Agricultural and Mechanical College. Older cows do not undergo the immunization process as satisfactorily, nor as safely, as the young animals. Calves and very young heifer stock often go through the course of the fever without the care of a veterinarian, and can be safely handled under expert supervision at the college.

"During the past year the delivered prices on this class of dairy stock for the Guernsey and Holstein breeds have ranged from $150 to $175 for well developed cows; high grade two-year-olds at $90 to $125; yearling heifers at from $25 to $50. Pure-breds ranged from $150 up. The grade cows mentioned usually have a capacity of five to eight gallons of milk per day, under good conditions.

"On the Texas market good grade Jersey stock, matured cows, can be had for $85 to $150; two-year-olds and yearling heifers at correspondingly low prices; registered stock, either cows or bulls, at $125 up.

"The two judges and buyers representing the Extension Service will leave for the North the first week in October. Those wishing to place an order either for a cow or several, or a carload, should get together and report to me at once. The age, number wanted, and range of prices to be fixed by the buyer or party wanting the stock. Drafts will be drawn direct by the parties who own the cattle, on the party buying, for the purchase price. Other expense will follow with the freight charges at destination."

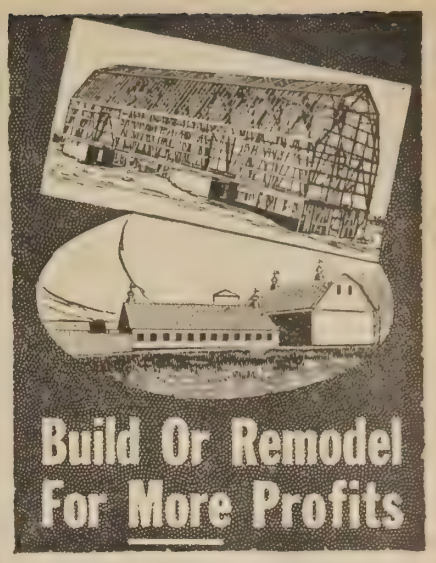
Texas. W. D. HORNADAY.

Abortion

I have abortion started in my herd of cows. Will that take its course or is there a cure for it? If you know of a cure I wish you would let me know.

Norwalk, Wis. A. D.

There is no specific remedy for the contagious abortion disease but it may disappear or lose its effect in your herd after a time if you follow a systematic plan of disinfection under the direction of a qualified veterinarian. Cleanse, disinfect, and whitewash the stable and then use a disinfectant on the floors and in the gutters two or three times a week. Have the veterinarian disinfect cows that have aborted and before breeding any cow or heifer, syringe out her vagina on alternate days for two or three weeks with lukewarm water containing a disinfectant prescribed by the veterinarian.



Fouls

I have trouble in my herd of Jerseys with foot thrush. It appears similar to the thrush that affects the frog of a horse's foot. The affected young animal loses flesh, goes lame in one front foot, and appears in bad general health. Animals run on grass pasture, no manure or stabling. One bull, after treatment of his affected feet with sulphate of copper, recovered, and now has recurrence in same foot two months later. Another similarly treated has recovered. Disease appears to be constitutional as well as a local trouble.

Eatonton, Ga. B. W. H.

The disease, no doubt, is "fouls" or "foul in the foot" caused by lodging of foreign matters between the toes or irritating from wading through rank growths of wet grass. Keep affected cattle off grass for a few days. Then saturate oakum or cotton with a five per cent solution of coal tar disinfectant and bind it upon affected parts by means of a narrow bandage. Renew the dressing daily. In mild cases an application or two of pine tar sometimes is all the treatment necessary.

Food saving was at first a fad; then a patriotic service; now a habit.

James planned and equipped dairy barns mean more milk and less work. Make your dairy barn an efficient work shop and profit maker. Install

JAMES
Sanitary Barn Equipment

Give your herd contentment and comfort and they'll give you more milk. James equipment is the practical profit-maker that thousands of America's dairymen use. Tell us when you intend to build or remodel and for how many cows — we will send you the big "Jamesway" Book Free.

DAIRYMEN WANTED:

A Borden Milk Condensery has just opened at Fort Scott, Kansas. This is the greatest dairy opportunity in the United States. Dairymen are wanted to bring herds here and enter the dairy business on shares with the landlord.
Chamber of Commerce, H. A. Russell, Secy., Fort Scott, Kan.

The Farmer's Concrete Mixer
SHELDON Batch Mixer Price $11.50 Up

Concrete saves lumber and steel for ships. A Sheldon Mixer saves labor and gets the work done besides. Designed especially for the farmer. Highly praised by users. Farmers everywhere say it's the ideal machine for them. Used now in every State and in a dozen foreign countries. Small enough to move easily—big enough to keep six men busy. Lowest in price. Build your own feeding floors, silos, tanks, troughs, foundations, cribs and buildings.

Read What These Sheldon Owners Say

I and my hired man laid a feeding floor for my hogs, 24x24, in one day; also put floor in my cow barn. My neighbor liked it so well I am not able to keep it at home.—ANDREW CHRISTENSEN, Hancock, Minn., Rt. 1.

We have used the mixer during past year for putting in cement foundations for a complete set of farm buildings, including silo, and like it very much.—DANA WEIGHT, Jamestown, N. D.

Last year I bought a cement mixer from you with which I am well satisfied. It did not take long for it to pay for itself and I surely can recommend it to anyone needing a *big mixer at a small price*.—WM. PARKS, Martinton, Ill.

I am more than busy with my Sheldon Concrete Mixer. Have more work than I can do. *I get $10 a day when I work out.*—JESSE L. WITTER, Wellsville, N. Y.

The machine works fine. Have already *got the job* of mixing concrete for the bridges in this township.—JOHN ROSS, Spartanburg, Pennsylvania.

Last spring we purchased of you a set of castings to make a concrete mixer. It was constructed per the plans furnished and it *surely worked great*.—D. M. BRUBAKER, Freeport, Ill.

FREE PLANS

Make your own concrete mixer. You can do it at a cost so low you can not afford to mix concrete by the shovel method. Along with our iron parts we send Free Plans and permit for making your own machine. A good way to get a practical mixer at a small expense. Or, we will sell you the complete machine, ready built.

Make Big Money at Concreting

If you buy a Sheldon Mixer for your own use, you can make many times its cost in a season by renting it to your neighbors. Or, if you want to go out with the mixer on contracts, you can easily earn $3 to $20 a day. Our customers are doing it right now. The jobs go to the man with a Sheldon Mixer every time.

Write For Our New FREE Catalog

Shows our full line of mixers which are sold direct to you on strong guarantee. *Thirty days trial* privilege. No other like it. Patented. Two styles, hand and power. Mixes 2 1-2 cubic feet a minute. One man can operate it, but it will keep 2, 3, 4, 5 or 6 men busy. Continuous chain drive. Tilting dump. Easily and quickly moved. All parts guaranteed. Does work equal to $400 mixers. Be sure to get the catalog. Write today.

My New Special Offer

I want to tell you about my co-operative plan by which you can get my time-tried, thoroughly proven Sheldon Batch Concrete Mixer at little or no cost to you. I want ten men in every county to accept my special co-operative offer right now. Are you going to be one of the ten? Write and say: "Send me special offer."

The Sheldon will pay for itself on first small job. Takes the backache out of concrete. Makes possible those many small improvements that add so much to the value of your land.

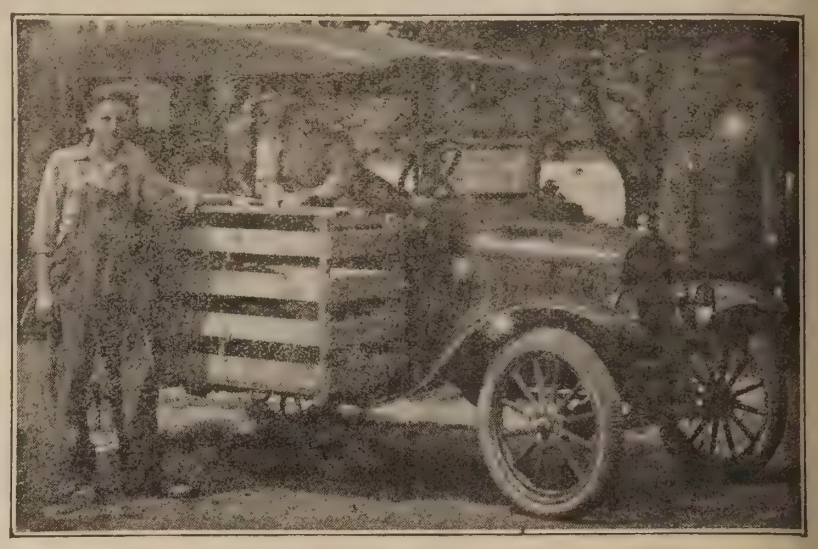
HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Helping the Boys to Get Started

Presuming that I am speaking to people who are interested in raising better boys and better hogs, I will not bore you with the details of hog raising, but merely enumerate some of the things that have been done in Williamson County in helping the boys to get started, especially along the line of the pig club movement.

With sixteen Williamson County banks financing pig club boys, I am safe in saying that no deserving boy has yet been refused assistance in buying his pig or brood sow, where he was willing to follow the suggestions of the county agent. While some bankers have made different terms, given more or less encouragement, assistance, and boosting to the movement, Mr. T. B. Benson, cashier the Bartlett National Bank, has been one of our greatest helpers, boosting and materially aiding one of the greatest pig clubs in Texas. He has backed the boys, continued to take interest in them, kept them encouraged, and helped them through adverse circumstances, and while some pig clubs were content with grade hogs, and by following the best methods of feeding balanced rations made good money on the fat hog market, we set out to not only raise meat, but the very best breeding stock to be found in Texas, to supply other sections getting started later.



With two carloads of business men, we organized at eight schools in Bartlott trade territory, the Bartlett Boys' Registered Pig Club in one day. Mr. Benson financed the boys at 8% interest, taking their plain moral note with their father's permission in every case but with no endorsements or leins, allowing the boys two years, if needed, to actually make the money out of their hogs with which to pay their notes and further financing them with their feed bill, due to the severe drouth cutting short our feed crops. A solid carload of registered big-type Poland-Chinas, selected by the county agent from the leading Kansas breeders, the best in breeding that money could find, were shipped to the county and distributed to pig club boys in different sections, financed by several bankers. The Bartlett National Pig Club members got thirty sow pigs and one boar, three months old, cholera immune, weighing an average of 68 pounds each and costing $25 each.

During a severe drouth when all feeds were purchased at highest retail prices, by feeding balanced rations, utilizing waste, and pushing to the limit, each boy made a profit over the cost of production. From a meat hog standpoint alone, they were shown in 100 days for a $20 gold piece given by the bank to the boy making the best record which was a gain of 200 pounds. The average daily gain of all hogs shown was 1.25 pounds per day, the entire bunch weighing an average of 198 pounds each. A new class of hogs and a different viewpoint established for the community was destined to change the old breeders' viewpoint and create a greater interest in better hogs.

It has now been practically one year since the pigs were distributed; they are now sows weighing from 400 to 600 pounds. The first 12 farrowed 110 pigs, seven of them farrowing 11 pigs each. Now practically all have farrowed and in nearly every case a large litter. There has been a great demand among the farmers and other boys of the community for these pigs, many of which have been sold at weaning time for from $25 to $35, none for less, while several of the boys with the best litters have refused to sell their pigs now, preferring to keep their entire litter together, pushing them in the county contest, to win a Dallas Fair Scholarship for the 13 best litters, expecting to take their exhibits to the fair with the Williamson County big type Poland-China string of entries, there to show to other sections what this county's club boys are doing towards feeding the soldier boys. Incidentally they hope to sell their extras at fancy prices. One boy has been guaranteed $1,000 for his sow and litter of 11 pigs at Dallas this fall. He expects, however, to get more, as he will by then have his second litter.

One of the $25 pigs at nine months weighing 112 pounds, was shown at the fat stock show in Fort Worth. The day she was 12 months the owner refused $300, then $500, and finally refused to price her at $1,000. Today she is the mother of eight pigs, several of which are already sold to be delivered at four months for $100 each.

To show further the interest created by these hogs the boar pig now weighing around 600 lbs. at one year old, has served 62 sows, and the owner is now turning down all people wanting service except the club boys with big type Poland-China sows for their second litter. People have sent their sows for miles and he has probably done more towards breeding up a uniform type in a community than any other in Texas. We have eight of these boars of three different

PAUL LOGAN, STOCKWELL PIG CLUB, INDIANA, READY TO TAKE HIS GILT HOME

strains of breeding in the county which will, in due time, be exchanged. They are distributed uniformly over the county so that practically every section is being benefited by the importation.

When a man complains to the boys about having to pay them $25 for a weaned pig, as one year ago they hooted at the idea of the boys paying that price, saying no pig was worth more than $5.00, the boys show them where Mr. Walters of Kansas sold 49 head of sows and gilts at auction, six months after we had picked our carload from his bunch, for an average price of $400.61. They tell the farmer to leave them alone as they are worth more money and will easily sell for $100 each soon. The bank will help them carry them, but the farmer usually crates the pig and takes him quickly at the boys' price. There has so far been a greater demand than a supply with outsiders coming in wanting them, also. A number of breeders over the state are waiting for several pigs from the bunch to be shipped them for their own herds. Some have been sold to other county agents for starting their pig clubs. It is our purpose to continue redistributing these pigs over the county until our carload of meat hogs will all show the results of the carload of breeding hogs introduced through the boys. An inventory taken several days ago showed that by 13 club members with big-type sows, 90 registered pigs were being fed for the fall shows.

This story would not be complete without telling what our twice county champion pig feeder has done in twelve months from an original investment of $57.75 for an Ohio bred gilt that has farrowed two litters of pigs. These he sold for $326, keeping one pig that is now larger than the mother. He has two litters on hand. Most of the 15 pigs sold at $20 each to be taken at weaning time and he can get at least $200 for either sow, and will probably have two more litters to show at the fall fair. This is over $1,000 in cash and hogs on hand since last April.

The Bartlett National Pig Club boys now have their orders in for a carload of registered Holstein-Friesian heifers, to come from the best northern herds, to combine cows and hogs in their operations. This operation is also being financed by the same banker. It is needless to say that these bankers are being boosted by the club boys, that practically all the boys' notes have already been taken up, some have bank accounts, and on several farms the only clear money made during the past year was by club boys with their hogs. Especially is Mr. Benson pleased with the Bartlett National Club boys, their work and records, and what they are doing to build up the hog industry of a county and state. I am sure that other sections which have started with their grade hogs, needing good registered boars and sows to improve their herds, can find the best of breeding in Williamson County, right at home, and at better prices than they can possibly think of getting the same stock in the north. In a short time, all the hogs in this county will show that smooth, large, long, big bone, uniformity of type, the results of a vision backed by live bankers, co-operating with the

Junior Letters

Hoard's Dairyman Juniors:—I read the page devoted to the juniors every week and it interests we greatly for I enjoy outdoor life.

I received my creed and fob some time ago which I appreciate very much.

We live on a farm of 100 acres in the northern part of New York, which is mostly made up of hilly ground. Our farm is stocked with Jersey cows, most of which are pure-breds, except for a few high grades.

We have three work horses, one of which has a little colt, two yearlings, and one two-year-old. We also just sold three horses.

Up until this year we have always made butter and therefore kept many pigs, but as it is so much work we send our milk to a station which pays by test.

I have a dog named Teddy and a little black kitten which I call Snowdrop.

Well, I must close, hoping that some of the juniors will write to me.

New York. Erma Rowlee.

Hoard's Dairyman Juniors:—Hello! How are you? I am still a junior although I have not written for a long time.

We have two little calves now and one of them is all white without a bit of red on it and the other is white and red.

Our school will soon start again and I will have the same teacher that I had last year.

We might have the threshers this month, but I don't think so.

We will soon have the Scott re-union. I can't think of any more to write so I will have to close my letter.

Utah. Fern Scott.

Hoard's Dairyman Juniors:—It is quite a while since I have written my first letter to the Hoard's Dairyman Juniors.

I am very much interested in the juniors' page and read it whenever I find time.

We have a silo. The silo is fourteen by thirty-four. We are fixing our barn now. We are going to put in a manure carrier and steel stanchions. We are going to make an ensilage truck.

I am riding a small patch of potatoes. I intend to have a larger garden next year.

I would be glad to receive letters from any of the juniors. I must close as my letter is getting rather long. My address is Darlington, Wis., R. R. No. 3. H. T. Sowls.

Hoard's Dairyman Juniors:—I have been intending to write to you and let you know just how things stand, but have been so busy haven't had any time. I take great pleasure in reading your paper and wouldn't be without it for anything. I believe it is the best dairy paper published. We have been taking it for several years now and will continue to do so.

Some three years ago I joined your Junior Boys' Club and also was your representative for Long Prairie and got a few subscriptions, but now I am so busy with the farm work and my brother will have to go to war soon, I won't have time to get any more subscriptions. Since I have joined your club I have got 150 chickens, a colt, a couple of calves, and a pig.

This year we have in 23 acres of potatoes besides wheat, oats, rye, corn, and other small grains.

Hoping that you will have good luck in your junior club and get a lot of subscriptions, I remain

Minnesota. Percy Boorman.

Hoard's Dairyman Juniors:—This is my fourth letter to the Hoard's Dairyman and I have seen one in print and hope to see this one. My calf is doing well now. I have her on good pasture now. I am going to keep her until she comes fresh. If the calf is a male I am going to sell him and keep the money.

I will close with good luck to the juniors.

Missouri. Johnnie Zigelhafer.

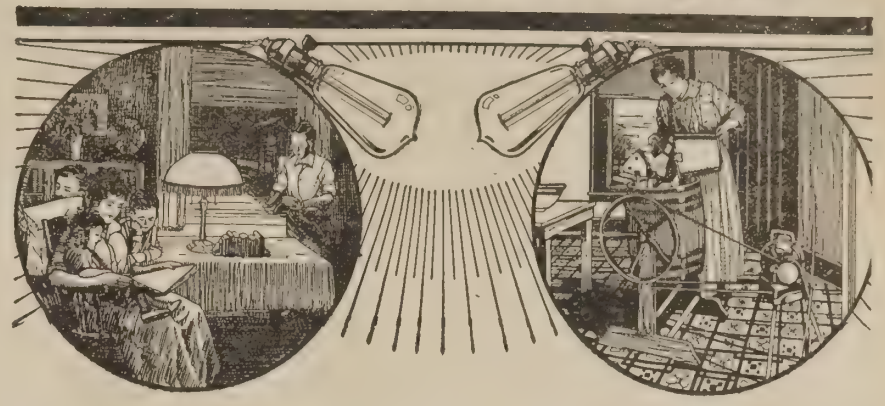
Hoard's Dairyman Juniors:—I guess you have forgotten me but I am still a junior.

In the last letter you wrote you asked me whether I am going to raise corn this year? Off of my first lot of corn this season I made 75c and I do not know how much money I will make off of my last lot of corn.

Night before last we had twin calves which are very fat for their age.

You asked me what was the matter with those grade Guernseys? My father had more stock than he could handle.

We are getting ready to fill our silo, but I do not know what day. We have 10 acres of corn to put in the silo and about 20 acres of yellow corn.



We have moved in town but I am on the farm 3 days in the week. My new address is 101 West Main St., Westminster, Md. I was out to the farm yesterday and ate too many grapes and I was very sick today, but I am better this evening.

I see there is only one other boy besides me in Maryland.

I guess I will close wishing that some of the juniors would write to me.

Howard Koontz, Jr.

DELCO-LIGHT
INCREASES FARM EFFICIENCY

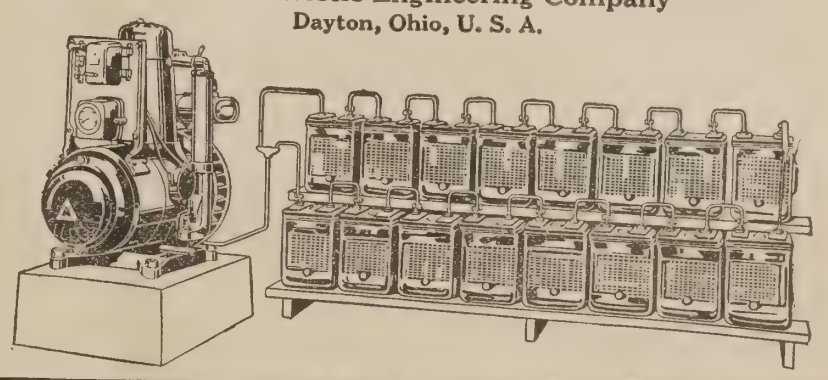
Delco-Light in the Farm Home Means:

An abundance of clear, bright electric light throughout the house and barn.

Running water in house and barn. A modern bath room, fire protection. No laborious pumping.

Economical power to operate the washing machine, the churn, the cream separator, the vacuum cleaner and other small machines.

It means increased profits in time and labor saved.



And a home that has in it the comforts and conveniences usually found only in the city.

Delco-Light is a complete electric light and power plant for farm or country home. It is self-cranking, air cooled; ball bearing. Has thick plate, long lived storage battery. No belts.

RUNS ON KEROSENE

There is a Delco-Light man in your locality. Write for his name and for the new Delco-Light book

Experienced farmer wants position by month or on shares. Married. No boozer or smoker. R. 3, BOX 86A, Whitewater, Wis.

The Mojonnier Fat Test

HOARD'S DAIRYMAN:—The methods of determining the percentage of butterfat in milk and its products may be classified as scientific and practical methods. In practically all cases the scientific methods, involving the use of delicate apparatus and expert laboratory technique, have been replaced by the so-called practical methods. Hence, many of our more delicate tests for determining the percentage of butterfat in milk are only of historic importance in the dairy industry.

It is of interest to note that the majority of our butterfat tests, including the scientific and practical methods, are based on one of two principles, the first being that butterfat is not soluble in certain acids. The ether solubility of butterfat is the principle involved in the second group of methods of analysis. The Babcock test involving the first mentioned principle has found universal application in the dairy industry.

The development of ether extraction methods of analysis in the dairy industry has resulted mainly in the development of tests which could not be applied to the practical side of the dairy work. However, in recent years an ether extraction method has been perfected which has and will continue to be a valuable asset to certain phases of dairy work.

In brief, the steps in ether extraction methods of analysis are as follows: A weighed sample of milk is mixed with alcohol, ammonia, ether, and petroleum ether. The casein is dissolved by the action of the alcohol and ammonia. This action permits the dissolving action of the ether and petroleum ether upon the fat to proceed. The purpose of adding the petroleum ether is to prevent the ether from dissolving non-fatty solids in the milk sample. The per cent of fat in the milk sample is then determined by the specific gravity of the fat-containing ether, or by the refractive index of the solution, or by the weight of the fat extracted by the ether.

Ordinary laboratory technique is not sufficient to successfully determine the percentage of fat in the milk sample by taking the specific gravity of the fat containing ether, or by the refractive index method. E. Gottlieb and B. Rose proposed a method which involved the weighing of the evaporated butterfat as a means of determining the per cent of fat in the sample. Their method, however, involved a process and apparatus which could not be successfully applied to the dairy work.

During recent years, the Mojonnier Brothers developed a practical ether extraction test. This test is rapid and accurate, and hence it is the only ether extraction test that is finding a general application in the dairy industry. Without a detailed discussion of the process of manipulating the Mojonnier tester, it is sufficient to say that well planned equipment, including vacuum ovens, are largely responsible for the success and accuracy of this method. The plan of separating the fat containing ether from the non-fatty solids by centrifugal force is used to great advantage in developing rapidity in the process. (The apparatus provided for the operation of this test includes apparatus for making total solid determinations.)

This article would not be complete without a brief discussion relating to the economic importance of the Mojonnier test. The Mojonnier test is accurate to .02%, whereas other tests have an accuracy of .1%. At a plant purchasing 3,000 pounds of fat daily, in the form of 3% milk, an over reading of .1% means that the plant is paying for 100 lbs. of fat which are not received. In the same case an over reading of .02% would result in paying for 20 lbs. more than are actually received at the plant. Similar cases could be cited to illustrate the importance of using accurate methods of analysis where dairy manufacture is pursued on a large scale.

J. C. MARQUARDT.
California College of Agriculture.

A rainy day job: Clean and oil the harness.

Ayrshires

Judge: Professor C. S. Plumb, Ohio.

Only one herd, that of Adam Seitz of Wisconsin, contended for the premiums in the Ayrshire classes. Professor Plumb tied the ribbons in the bull classes much as they had been tied at Illinois, giving the grand championship to Cavalier's Lord Stuart and the junior championship to Cavalier's Netherall Chancelor. In the female classes the placings were changed. Bargenoch's Silver Pet was given the senior championship over the Illinois champion, Cavalier's Kilnford Dorothy, and the first prize junior heifer, Cavalier's Silver Actress, was given the junior championship over the junior yearling, Cavalier's Kilnford Lily.

Output of Mill Feeds

To acquaint farmers with conditions prevailing in the mill feed industry, the Food Administration outlines developments that may be useful as a guide when purchasing feeds. Most of the European countries have gathered their harvests and are now grinding wheat. The foreign demand for flour from the United States has slackened and has been replaced by a considerable demand for American wheat.

Shortage of animal feeds prevails among all the western allies, which now prefer to purchase wheat rather than to buy flour and mill feed separately. Wheat can be loaded very rapidly aboard ship on the American seaboard by mechanical conveyors. This operation consumes much less time than loading the equivalent of wheat as flour and its by-products and saves space.

One result of this development is a temporarily light production of wheat mill feeds in the United States. It should be recognized, however, that even with normal production of such feeds, the demand was expected to exceed the supply since the schedule of fair prices established for feed at the suggestion of the Agricultural Advisory Committee has made it very cheap, much cheaper in fact than it is worth compared with other feeds of equal nutritive value.

The reduced output of wheat mill feeds is accompanied fortunately by an unusually large production of certain coarse grain products. Food Administration regulations provide for an extraction from barley of only 55 per cent flour, leaving nearly 45 per cent of the barley berry for feed which is remarkably rich and nourishing. Barley feed in itself is not a substitute for bran, but needs to be mixed with other light material, such as oat feed, to give bulk. There is an ample supply of oat by-products at prices averaging less than the cost of bran.

As a result of the large wheat crop the "fifty-fifty" rule requiring the purchase of equal amounts of substitute cereals with wheat flour has been modified and this is expected to increase the output of American flour mills and result in more mill feeds.

The Food Administration recognizes

How the packer is saving millions out of waste

—and how this results in higher cattle prices for the stockman

The development of by-products out of waste means a saving of about one hundred and fifty million dollars annually—a sum sufficient to keep New York's six million people supplied with meat for six mont

THERE was a time when the steer was handled solely for its edible meat, its hide, and its tallow.

The remainder of the animal, in weight totaling many millions of pounds annually, was thrown away—a sheer waste.

Today virtually all of this former waste is utilized. Over 250 articles are now contributed by the steer to human needs, and a larger proportion of the animal is saved for human food.

At the time of writing $135 is, on the average, the price paid for the average beef animal to the stockman by Swift & Company.

But if the old order of waste still prevailed and only the hide and tallow were saved, Swift & Company would be obliged either to pay not more than $125 to the stockman, or to charge the public higher meat prices.

Thus, you see, by-product utilization results in a saving of about $10 per animal—a saving which, when multiplied by the total number of cattle dressed annually by Swift & Company, over two million, amounts to more than twenty million dollars annually. This saving goes to the stockman in higher cattle prices and to the consumer in lower meat prices.

If applied to the entire number of cattle dressed annually in America, approximately fifteen million, this saving would amount to about one hundred and fifty million dollars annually.

The real development of by-products came with the development of the larger packing organizations.

Success was attained not easily, but by patient effort, by exhaustive experiment, by intense specialization. It has been a big job and has called for big methods—a job far beyond the resources of the old, unorganized system of local meat dressing.

Not only are the by-products saved but their value has been increased through better handling of hides, fats, and other edible portions of the steer.

Swift & Company is glad to have had a part in this development. It is an achievement of thrift—an achievement that has made possible today lower meat prices to the consumer and higher prices to the producer of cattle than would have been possible under the old methods.

SOLD ON 10 DAYS TRIAL

All-steel, reversible, lasts a lifetime. Cuts V-shaped farm ditch, open drain, tile or irrigation, down to 4 ft. deep; cleans old ditches; grades roads; builds farm terraces, dikes and levees; works in any soil, wet or dry. 2, 4 and 6 horse sizes; large size fine for tractor. Does work of 100 men. Solves all dirt-moving problems. Write and find out how to make big crops sure. New, free book on drainage, irrigation and terracing. Address

OWENSBORO DITCHER & GRADER CO., Inc.
Box 812 OWENSBORO, KENTUCKY

that the amount of brewers grain is less than normal and distillers grains have almost disappeared from the market. Corn by-products, though uncontrolled in price, are plentiful. The period for which these conditions are likely to prevail is undetermined, but the situation will be materially changed when foreign orders for flour from this country are again filled. —U. S. FOOD ADMINISTRATION.

Editor's Note: Barley feed such as described is excellent, but the past winter there were varying qualities on the market. In buying, get a guaranteed analysis or learn the milling conditions at the local mill. Oat feed as offered on the market is now selling on the market in sacks at $16 to $18 per ton. It consists largely of reground oat hulls, and is about as valuable as oat straw or corn stover. It may lighten up the ration, but there are cheaper feeds available on most farms. There are oat feeds that are valuable, but the new commercial product going by that name is what was formerly blown into the furnaces and burnt.

Further, we do not agree with the statement that the barley feed needs to be lightened. Ground barley is not a particularly heavy concentrate even if none of the kernel is removed for making flour. Taking away 55 per cent of the meat of the kernel increases the proportion of hulls and makes the barley feed, as it is termed, light enough.

Southern Forage to Conserve Feeds

By requesting farmers in southern states to greatly increase their acreage of cover crops and winter pasturage, the Food Administration lends its support to a campaign, which the states themselves have begun, to conserve mill feeds and coarse grains. The success of this program will depend on the broad vision of southern producers who realize that their response will increase the aggregate amount of feed for live stock in the United States. This in turn means more meat, more milk, and larger food resources both at home and among the allies.

Throughout the country, especially in those northern states where insufficient live stock feed is grown, there is urgent need of mill by-products for dairy cattle and for hogs, also cottonseed meal as an important part in animal rations.

John M. Parker, Federal Food Administrator for Louisiana, makes these suggestions which have been transmitted to Food Administrators in the southern states.

"With the lessening of man power both for planting and harvesting crops, the small grains can be used to great advantage where heretofore the planting has been extremely limited. Wheat, oats, rye, vetch, and the clovers planted in most of the southern states at any time before the middle of November, will start a vigorous growth and will not winter-kill except in very extreme weather.

"On properly cultivated and prepared fields, these grains and legumes will afford not only rich and nutritious pasture nearly all winter, but in the spring will make reasonable grain returns as the grazing does not seriously affect productivity. A vigorous campaign along these lines will be an inestimable benefit in conserving those feed products so vitally needed. This southern effort when carried out in co-operation with the Department of Agriculture and demonstration agents, will bring about great relief and great saving."

The plan as outlined may be modified to meet local needs and to best conform with farming policies and methods in the states concerned. American farms, the Food Administration points out, constitute the dominant reservoir of meat products from which the needs of our own troops and the allied armies and populations must be met. Every additional acre of forage crops and winter pasturage will thus not only increase our feed supplies, but add directly to available meat exports.

Dairymen who ship their milk to the cities will be interested to know of efforts by the U. S. Food Administration to secure for them more prompt returns of milk and cream cans. At Topeka, Kansas, two additional cars have been added for handling empty cans and the service has been greatly improved. At the suggestion of the Food Administration, the express companies are sending out circulars calling attention to the need for quick service in returning cans to shippers.

Moline-Universal Makes Wonderful Record at National Tractor Demonstration

Develops 20 H.P. on the draw bar and we only rate it at 9 H.P. Think of it!-

Officially Accredited with 26.48 H.P. at the belt- We rate it at 18 H.P.

MOLINE PLOW CO., MOLINE, ILL. — DEMONSTRATION GROUND, ATTEN: S.C.TURKENKOPH.

Dear Sir:—
We beg to report the following performance of a Moline Universal tractor 9-18 H.P. Serial No. 19002 Motor No. 10002 under test for draw bar horse power.
Conditions:-
Soil: Stubble ground- loose on top firm underneath.
Load: Plow. two fourteen inch plows.
Dynamometer : Hyatt Recording.
Draw Bar Pull: Average for one minute in maximum.
Time: Recorded by dynamometer.
Hitch: Horizontal - centered.

TEST NO.	GEAR	DRAW BAR PULL	SPEED MILES PER HOUR	DRAW BAR HORSE POWER	REMARKS.
2A		2155#	2.18	12.5	Average plowing
2B		2135#	3.52	20.05	maximum

OBSERVERS:
G. H. WOOLLEY JR.
L. S. NEWMAN
J.B.DAVIDSON.

ENGINEERS IN CHARGE.
MANAGER OF DEMONSTRATION.

IN previous advertising we have stated that the Moline-Universal was conservatively rated at 9-18 h. p. Just how conservative is shown by the astonishing official tests made at the National Tractor Demonstration which showed the Moline-Universal to have an excess of over 11 h. p. on the draw bar and 8 h. p. at the belt.

Certainly these tests show beyond question of doubt the efficiency of the Moline-Universal. For each 169 lbs. of weight the Moline-Universal developed 1 h. p. on the draw bar. Compare this with the ordinary tractor which develops 1 h. p. for each 250 to 300 lbs. weight—and you will clearly realize the greater efficiency and corresponding greater economy of the Moline-Universal.

However, we shall continue to rate the Moline-Universal at 9-18 h. p. A tractor to give satisfactory service and stand up for years under the strain of tractor work must have reserve power, and the greater the reserve the better. Under normal conditions the Moline-Universal has from 50 to 100 per cent reserve power. Think what this means.

Ninety-eight per cent of its entire weight is on the two big drive wheels where every ounce is available for traction. The Moline-Universal is scientifically constructed and utilizes its weight to best advantage. It has no dead weight.

From the above report you will see that the Moline-Universal developed 20.05 h. p. at 3.52 m.p.h. pulling two plow bottoms 9 to 10 in. deep in exceptionally hard plowing. At 2.18 m.p.h. it developed 12.5 h. p. The difference in speed accounts for the extra draw bar pull. At 3.5 m. p. h. under average conditions the Moline-Universal will plow as much in a day as a 3-plow tractor traveling at 2.25 m.p.h.

Just the Right Size

If the Moline-Universal were built to pull a 3-bottom plow, it would be too heavy for light work. As the Moline-Universal is now built it has ample capacity for all ordinary plowing needs, and at the same time is equally suited for light operations such as cultivating, haying, harvesting, etc. which require far more work hours than your heavy work.

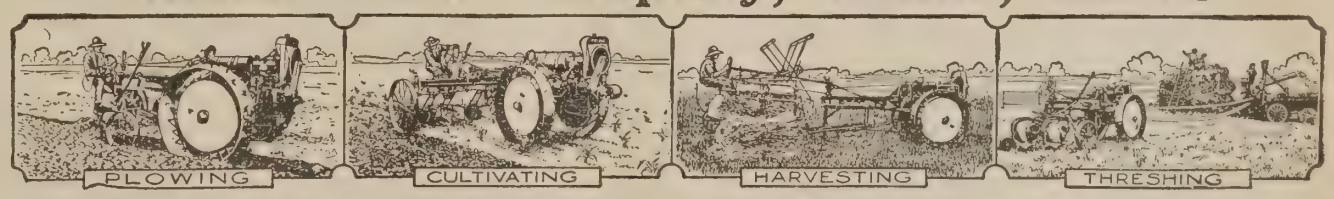
You are chiefly concerned in getting your work done quicker and better than you ever did before. You have no fixed power requirements. One day your work may be heavy, the next day light—and the light work is just as important as the heavy. Thus, you must have a tractor which will do both heavy and light work efficiently and economically, and the Moline-Universal fully meets both these requirements. You have plenty of power when you need it and when you don't want it you have no extra expense—as you would have with a heavy tractor for light jobs.

Remember this—here s what the Moline-Universal Tractor will do for you:

(1) Gives you plenty of power for all your work, both heavy and light.

(2) It does all farm work including cultivating.

(3) One man operates both tractor and implement from the seat of the implement in all operations.



(4) Electric lights enable it to be worked nights to make up for unavoidable delays.

(5) Because of self-starter, non-robust labor can operate tractor successfully.

(6) So well made and has so much reserve power that it will give many years of service.

Send for free catalog which gives detailed description of the Moline-Universal Tractor. Address Dept. 18.

Moline Plow Company, Moline, Illinois

RO-SAN Indoor Closet

The original chemical closet. More comfortable, healthful, convenient. Takes the place of all outdoor toilets, where germs breed. Be ready for the long, cold winter. Have a warm, sanitary, comfortable, odorless toilet right in the house anywhere you want it. Don't go out in the cold. A boon to invalids.

GUARANTEED ODORLESS

The germs are killed by a chemical in water in the container. Empty once a month as easy as ashes. Closet guaranteed. Thirty days' trial. Ask for catalog and price.

Use the feed that's mixed for you!

It's mixed right and makes more milk

Complete! Balanced! Ready to Feed!

Here's a better feed than you can mix! It has just the right percentage of protein, fat and carbohydrates. It has been tested till it's proved and now we're ready to prove it to you by a guarantee of better results than you ever had.

International Ready Ration

Is Easier—Safer—Better to Use

Banish the fuss, muss and bother of mixing. Do away with the danger of poor quality ingredients. Avoid any risk of shortage of material for mixing.

Makes More Milk

International Ready Ration is better than the ordinary home mixed 20% protein feed. It is perfectly balanced, bulky and mildly laxative. Its use will produce more milk from every cow and keep your herd in the best condition. Quality as well as results are guaranteed.

Try It Order a ton today from the nearest International dealer. If he is not conveniently near you, send your request to us. We'll give it prompt attention.

Manufactured only by

INTERNATIONAL SUGAR FEED CO.

Minneapolis, Minn. **Mills at Minneapolis and Memphis**

Also makers of International Special Dairy Feed—the original guaranteed ration for cows—made to mix with home-grown grains or can be used alone.

Gossard Breeding Estates Spring Sensation

Entire Willowmoor Ayrshire Herd Goes to Indiana

H. W. Gossard, proprietor of the Gossard Breeding Estates, Indiana, sprung one of the biggest live stock sensations of the year when he purchased almost in its entirety the great breeding herd of Ayrshire cattle known internationally as the Willowmoor herd owned by J. W. Clise of Washington.

The purchase consists of eighty-four cows in milk, four bulls, and twelve heifers, an even hundred animals. The purchase includes some of the finest producing Ayrshires in the United States, including last year's two French cup winners, Willowmoor Happy Girl C, and Willowmoor Lily 5th. The herd contains the choicest breeding as well as striking individuality. Production has characterized this herd for years, special efforts being made to breed for scale and production. Only the choicest bulls have been used and Mr. Clise's judgment certainly has been vindicated, as no less than five of the leading ten Advanced Registry sires of the breed made their reputation at Willowmoor Farms. Beuchan Peter Pan has forty-three entries averaging 10,315 lbs. milk, 460.55 lbs. fat; Morton Mains Queechy has 46 entries averaging 9,868 lbs. milk, 399.64 lbs. fat; Holehouse White King, 36 entries averaging 10,220 lbs. milk, 399.10 lbs. fat; and Willowmoor Robin Hood, 31 entries averaging 9,878 lbs. milk, 434.14 lbs. fat. This is the blood predominating in the Willowmoor herd. This herd has produced no less than six world records, at this time holding the world Ayrshire fat record with Lily of Willowmoor, 22,596 lbs. milk, 955.56 lbs. fat, her fifth entry. Other notable cows developed there include Gerranton Dora 2d, 21,023 lbs. milk, 804.79 lbs. fat; Willowmoor Vesta 4th 17,755 lbs. milk, 753.18 lbs. fat; Willowmoor Etta 3rd, 16,621 lbs. milk, 666.06 lbs. fat. The Willowmoor herd has maintained a uniformly high testing herd. For 40 months and in 1,838 individual official tests this herd has averaged in butterfat 4.239%.

On September 14th, seven cars of stock left Washington consigned to Indiana, and due to arrive about October 1. Over and above the Clise purchases, the Gossard Breeding Estates have made extensive drafts on the E. B. McFarland herd of California, and Good Hold Farms of Ohio. Included in the McFarland purchases is a bull calf out of Willowmoor Vesta 4th, the junior four-year-old champion of the breed in milk production. This youngster has been purchased at a new record price for the breed. The Gossard purchases within the past few weeks total over 150 head.

Mr. Gossard has secured Mr. Cuthbert Nairn as herdsman. Mr. Nairn is a splendid man for the position. He has had considerable experience both at Highland Farm and Penshurst Farm and his presence at the helm should help spell success for this new Ayrshire breeding establishment.

Mr. Clise has retained some twenty-five animals at Willowmoor. He has built up a wonderful herd and every Ayrshire breeder hopes that he will long continue as a breeder of the "perfect cow" which he has so popularized in the show ring and by the records made at the milk pail.

Vermont. J. G. WATSON.

Farmer Johnson read in his daily paper that the government was going to make an effort to "stable-ize" the dairy industry.

"Well," he said, "I have always known that good stables are a mighty important thing in dairying."

Nothing Is More Important

DO YOU think of *Digestibility* as being just a big, vague word which has little or nothing to do with anything in particular in your line of business?

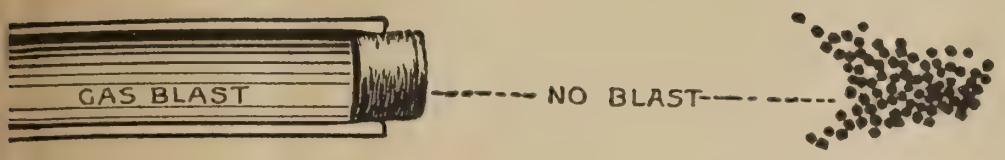
Or do you think of *Digestibility* as being something which really has some definite connection with the amount of money to be made from the dairy?

There isn't a thing about the dairy business any more important than *Digestibility*.

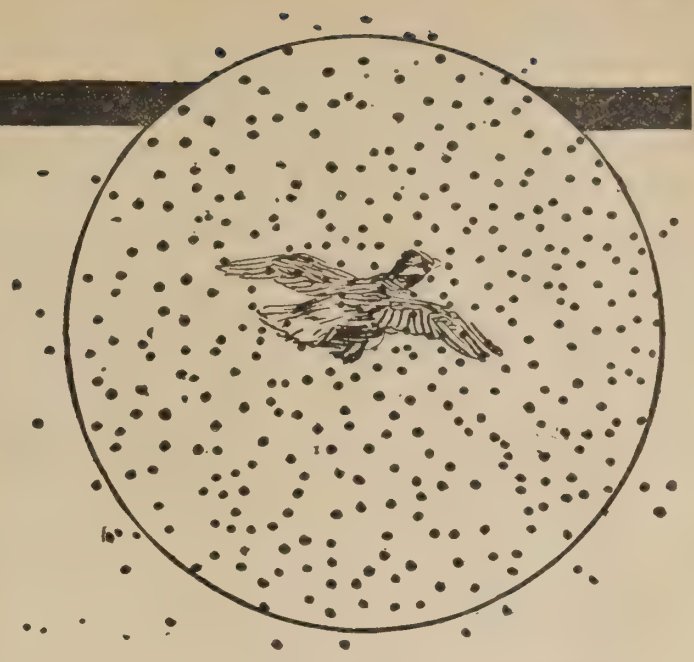
BUFFALO CORN GLUTEN FEED

When you pay a good price for coal to burn in the heater, and get a lot of clinkers, you don't think you have gotten your money's worth, do you?

You are up against the same thing in feed. Feed that runs 'way down in *Digestibility* is just as poor a buy as clinkery coal.



Feed has to break down and get through the cow's digestive tract in order to make milk. Unless a big share gets through, you lose.



1,614 of the 2,000 pounds in a ton of Buffalo Corn Gluten Feed are milk-bucket possibilities. Look over the list and see what runs higher in *Digestibility*.

REFUND!

Keep the branded Buffalo Corn Gluten Feed sacks together and take them to your dealer for refund.

Corn Products Refining Co. NEW YORK CHICAGO

The Winchester pattern. 320 pellets, out of a possible 431, or 74% of the shot charge, evenly distributed. No birds get through

How many birds get through your shot patterns?

IT is not enough to know that your shells shoot hard, that they are sure fire and water-proofed. ***It's the pattern that counts.***

The secret of good patterns is in the *wadding*. Good, close shooting, evenly distributed patterns are the direct result of a correct system of wadding scientifically adjusted to the bore of your gun.

The wadding, like the piston head of a gas engine, must give the explosion something solid to work against so that the shot may be *pushed* out evenly.

It must expand and fill the tube of the barrel, completety sealing in the gas behind it. No gas must escape to scatter the shot.

It must offer just the right amount of resistance to the explosion so as to develop uniform pressure and high velocity without danger of jamming the pellets out of shape at the "choke" or muzzle constriction.

The illustrations at the side of this page show actual test patterns as high as 63% faulty, the result of poor wadding.

The Winchester system

The Winchester System of Wadding is the result of repeated experiments to determine the most efficient control of the gas blast.

The special construction of the *Base Wad* gives what is known as *Progressive Combustion* to the powder charge.

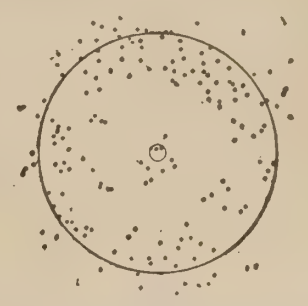
Combustion spreads instantly through the powder charge. By the time the top grains of powder become ignited the *full* energy of the burning powder behind is at work. Though the explosion is almost instantaneous, it is none the less *progressive*, the final energy and maximum *velocity* of the completely burned powder being developed at the *muzzle*, where it is needed.

Meanwhile under the heat of combustion, the tough, springy *Driving Wad* has expanded to fill the barrel snugly all around. No gas escapes. It is completely sealed in. The wadding *pushes* up the shot evenly.

At the muzzle the shot pellets slip out without *jamming* while the wadding is *checked for a brief interval* by the constriction of the muzzle. *It follows some distance behind the shot pattern.*

The shot cluster travels on, unbroken by gas blast or wadding, and makes the hard-hitting, uniform pattern for which Winchester shot shells are world famous.

Fish-Tail Flash. All Winchester smokeless shells are made with the new Winchester No. 4 Primer—the quickest and most powerful shot shell primer made. Its broad *fish-tail* flash gives instant and thorough ignition. Every grain of powder is completely burned up before the shot charge leaves the muzzle.

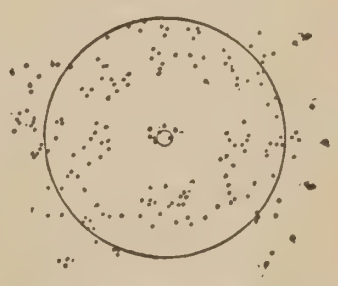


The Crimp. The required degree of pressure necessary in seating the driving wads is worked out in combination with the *hardness* or the *softness* of the *crimping* required for any particular shell.

Water-proofing and Lubrication. In the cold damp air of the marshes or under the blazing sun at the traps, Winchester shells will always play true. Winchester water-proofing process prevents them from swelling from dampness. Special lubrication of the paper fibres prevents brittleness and "splitting" in dry weather.

Uniform Shells. From primer to crimp, Winchester shells are constructed to insure the maximum pattern possible from any load and under all conditions. 25,000,000 rounds of ammunition are fired every year in testing Winchester guns and ammunition. $100,000 is spent annually in the inspection and testing of finished shot shells alone.

Clean hits and more of them



To insure more hits and cleaner hits in the field or at the traps, be sure your shells are Winchester Leader and Repeater for Smokeless; Nublack and New Rival for Black Powder. Write for our Free Booklet on Shells. **Winchester Repeating Arms Co., Dept. E-31, New Haven, Conn., U. S. A.**

Effect of bad loading of wadding increases breech pressure. Violence of explosion "jams" and mutilates pellets. Actual test target 160 pellets, out of a possible 431, or 37% of the shot charge

Effect of weak wadding pierced by the gas blast. The blast blows into the shot cluster, scattering the pellets in all directions. Low velocity and poor penetration. Actual test target 178 pellets, out of a possible 431, or 41% of the shot charge

Effect of hard wadding fitting barrel loosely. Unchecked by friction or muzzle choke, it is blown through the shot cluster scattering the shot. Actual test target 221 pellets, out of a possible 431, or 51% of the shot charge

WINCHESTER

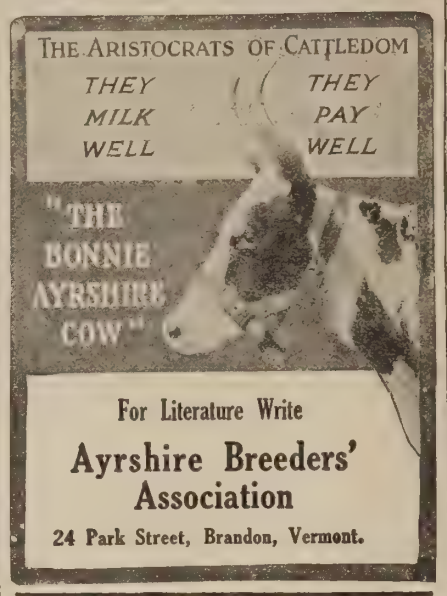
World Standard Guns and Ammunition

Southern Indiana Dairy Convention

The 1918 Southern Indiana Dairy Convention will be held at Seymour, Indiana, October 30-31 and November 1. A program of unusual interest is being prepared which will include practical demonstrations and discussions of the important problems that will confront the dairy farmer during these times when war conditions and war prices are having a big influence on the dairy industry. In addition to this program there will be a variety of other features to interest those who attend the convention. A large exhibit of dairy supplies and equipment, a show of dairy cattle, a calf club show, judging contests, milking contests, and on the last day a sale of pure-bred dairy cattle will be held.

This year's convention has been located at Seymour so as to reach the people of southeastern and south central Indiana in the same way that the 1917 convention reached the people of the "pocket" in Southwestern Indiana. But this year's meeting is being planned on a much larger scale than was the first annual meeting held last year. The Seymour commercial club is backing this year's show in a very strong way and a very complete organization has been formed to interest the farmers from a large number of southern Indiana counties.

This convention was established last year by the Indiana State Dairy Association in response to a definite demand on the part of the dairy interests in southern Indiana. It offers an excellent opportunity for the association to carry its work to the farmers in this section of the state where the dairy business is developing very rapidly.



C. R. GEORGE.

Register of Merit Jerseys
We bred the highest record Jersey Cow in Wisconsin. Our cows won prizes in the Wisconsin Dairy Cow Competition. Our sires are well known. We have the best of breeding. Our herd bred for type and production. Send for pedigrees, etc.
J. Q. EMERY AND SON, - Edgerton, Wis.

Lookout Farm Jerseys
Our Present Offering Affords an Unusual Opportunity to secure a Fine Foundation For a Productive Herd and comprises
A young bull, solid color, and ready for service. There is not a weak line in his pedigree. His sire carries 37½ per cent of the blood of Hood Farm Torono, the great sire of high producers; the sire's dam is an 11,000-lb cow; and on the bottom line of the bull's pedigree there is an unbroken line of Register of Merit cows for five generations. Five heifers dropped respectively Feb. 23, '17; Feb. 26th, '17; Apr. 5th, '17; Sept. 21st, '17; and Oct. 24th, 1917. All are sired by Lookout Prince, 115074, whose first daughters to freshen are now under test and are "making good". Three of the five are out of Register of Merit dams; and all five have R. of M. backing; are finely bred for production and are good individuals.
ADDRESS HENRY S. REDFIELD,
1925 Seventh Avenue, - New York City.

We are offering for sale Northern Grown Young Bulls out of cows with authenticated records of over

Young Guernsey Bulls

Of Good Producing Ancestry

with advance registry records. Good, strong individuals of the celebrated *Yeksa Breeding.* Send for price list.
Helendale Farms, 702 Cedar St., Milwaukee, Wis.

HERE'S A REAL BULL

His Sire is May King's Vrangue of Ingleside, the May Rose sire whose first ten tested daughters averaged over 600 lbs. butterfat as 2-yr.-olds and 3-yr.-olds. His Dam is an imported cow now on test that will finish her year with at least 400 lbs. fat, milked twice daily. The Bull himself is a dandy—a calf that would show well in any ring. The right kind of a herd header to use.

Remember he's guaranteed to be right. Write me.

Look For It—Wait For It

The Complete Dispersal Sale of
Brookdale Stock Farms
Entire Herd of Registered Holstein-Friesian Cattle

Owing to the fact that my five sons are in camp, or drafted and my wife very ill, in order to relieve myself of so much detail I am compelled to disperse my entire herd. We have no abortion, and have asked the State Veterinarian to be present in person when the cattle are tuberculin tested, and we give the privilege of a sixty-day retest, so sure are we the herd is clean. We have a son of King of the Pontiacs from a 30.13-lb. daughter Tidy Abbekerk Prince, one year old last January. He is a chip of the old block and worth crossing the U. S. to obtain. We have also a son of King Korndyke Sadie Vale whose two dams average 34.56 lbs. in 7 days, also a son of Rag Apple Korndyke 8th. Some 35 to 40 cows and heifers which will be fresh or springing by sale date. We have daughters of King of the Pontiacs, King Model and It. More than eighty head will be sold. The herd has been pronounced by other breeders as the best individuals ever offered by one man in a single day's sale. You may be assured that splendid individuals are the rule. We feel that cattle will be much higher in the very near future.

This your Golden Opportunity to get a selection at your price.

Sale October 29th, '18

HOLSTEIN SALE
At the Union Stock Yards Sale Pavilion, South Omaha, Neb.
TUESDAY, OCTOBER 15th, 1918
70 HEAD PURE-BRED HOLSTEINS will be sold, among them are:

10 daughters and granddaughters of KING SEGIS PONTIAC; a daughter of Johanna McKinley Segis, a 40-lb. bull; a daughter of Sir Ormsby Skylark, sire of Duchess Skylark Ormsby, the undefeated World's Champion Cow with a record of 1,506 lbs. butter in year. This is the first time this breeding has ever been offered in a sale ring in Nebraska.
6 daughters of Kalmuck Skylark Johanna, all sisters of NIVA KALMUCK, Nebraska's Champion Cow with a record of 45.18 lbs. butter in 7 days—the sixth largest record cow in the world.
2 daughters of Rag Apple Korndyke Boon, whose dam and sire's dam average 35.10 lbs butter in 7 days; a 2-year-old son of Rag Apple Korndyke Boon out of LOTTA CLYDE whose seven-day record is 709 lbs. milk and 31.33 lbs. butter.
These are QUALITY HOLSTEINS, the kind that will make you money in war times when feed is high, and the kind that will be sought for breeding purposes to replenish the world's supply when the war is over.
The consignors are: University of Nebraska; B. B. Davis, Omaha; S. H. Wilson Omaha; H. C. Langan, Omaha; Dwight Williams, Omaha; F. B. Aldous, Omaha; C. J. Furry, Franklin, Neb. For further particulars write

Highly Bred Cows Giving Buckets of Nature's Choicest Food—Holstein Milk

Sons of the World's Greatest Sires and Cows With Records From 30 Pounds Butter and Up

CALVES **HERD SIRES** **HEIFERS**

SPECIAL—A 47-POUND HEIFER

A yearling daughter of Fairview Korndyke Mata (47.11 lbs. butter, 801.5 lbs. milk in seven days—185.37 lbs. butter, 3216.6 lbs. milk in 30 days—World's 30-day Champion). The heifer is practically all white and the picture of her dam in conformation.

No Other Animal From Such a High Record Dam Has Ever Been Offered at Public Sale.

A selection taken at random from the catalog:—

Three daughters of the 41-lb. cow, Sunrise Hengerveld Caroline.

Three daughters of Ormsby Jane King, the $20,000 son of the GREAT WHITE HEIFER, the only cow who two different years made over 44 lbs. butter in seven days, the world champion in her class for milk and butter.

A show bull, from a 32-lb. daughter of Colantha Johanna Lad, sired by a bull whose dam made 32 lbs. and sire's dam made 36 lbs.

SIX daughters of King Segis Pontiac, one from a 30-lb. cow, another from a 32-lb. four-year-old; all are from tested dams. They are bred to the sire of the WORLD CHAMPION, Duchess Skylark Ormsby, the only cow to produce **1506 lbs. butter in a year.**

Daughters of that mighty sire, RAG APPLE KORNDYKE 8TH, bred to RAG APPLE THE GREAT, the only son of the only cow that ever made 50 lbs. of butter in a week.

A daughter and a grandson of the wonderful 39-lb. cow, Northern Fobes Denver, who three different years produced over 34.9 lbs. butter in seven days.

A 24-lb. daughter of the 40-lb. sire, Johanna McKinley Segis, from a 24-lb. daughter of Paul Beets DeKol.

Two sons of Sir Ormsby Skylark, therefore brothers to DUCHESS SKYLARK ORMSBY, the only 1,500-lb. butter cow, WORLD CHAMPION OVER ALL AGES AND BREEDS FOR YEAR BUTTER PRODUCTION. The dams of each of these bulls have 30-lb. official seven-day butter records. Both are Dandies.

Daughters of King Segis Pontiac Konigen, the $35,000 bull whose dam is a 40-lb. daughter of a 37-lb. cow.

A son of RAG APPLE KORNDYKE 8TH, sire of the only 42-lb. three-year-old and the youngest 30-lb. cow. Dam is a 32-lb. daughter of a 39.4-lb. cow who is also dam of the world champion, SEGIS FAYNE JOHANNA, the only 50-lb. cow who is also dam of the second highest record cow the world has ever known.

The Pick of the Breed, from the greatest producing herds known. Selected for Individuality, Breeding and Production. Offerings from State and Federal Accredited Herds.

A heifer daughter of a 32.75-lb. four-year-old who was sired by a 40-lb. bull and was from a 31.46-lb. cow. This heifer is bred to RAG APPLE KORNDYKE 8TH.

A yearling bull whose dam made over and whose sire is full brother to a 37-lb. cow and is from a 32-lb. dam.

Twin daughters of a 30-lb. cow sired by a bull whose dam produced 35.42 lbs. butter in a week and averaged well over 100 lbs. milk per day.

A 27-lb. four-year-old daughter of Duchess Ormsby Piebe Burke who has a 41-lb. daughter.

Daughters of Colantha Johanna Champion whose daughters are making wonderful year records and whose dam held the world's record for year milk AND butter production.

Tuberculin Tested, With a 30-Day Retest Privilege.
Guaranteed Clean, or No Sale.

Plan to attend the National Dairy Show and take in this sale, which will be held in Mitchell's Riding Academy and Sale Stable, 304 Hankins Avenue, Columbus. Take car marked "Main Street" and go East as far as Champion Avenue, then one block North and one East.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

The E. C. Schroeder Farms, Box 576-H, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

Young Bulls From Seven-Day and Yearly Record Dams

Dams of all bulls have official records of from 15 to 25 pounds of butter. All are now on yearly semi-official test and will complete records this fall and winter. Nearly every cow has completed cow testing records for three years and has produced up to 600 pounds of butter. These cows are never pushed to the limit. The bulls offered are sired by bulls secured from the E. C. Schroeder and other noted herds. Sires' dams have records up to 950 pounds of butter. Bulls are heavy bone, straight, well marked and large for their age. They will and must please. We guarantee satisfaction.

WM. N. OSBORNE, WANATAH, IND.

You Can't Afford to Overlook This Young Bull

Canary Ormsby Johanna De Kol 256894.

A SON OF THIS THREE-YEAR-OLD FOR SALE.

Canary Ormsby Johanna DeKol produced 28.18 lbs. butter, 503 lbs. milk in 7 days and 111.95 lbs. butter, 2,318.6 lbs. milk in 30 days at the age of 3 years, 1 month, 6 days. Her sire, Canary Fobes Bessie Homestead (20 A. R. O. daughters), is a 31-lb. grandson of Canary Paul and Homestead Jr. DeKol. Her dam is a 17-lb. 2-year-old daughter of Sir Ormsby Johanna DeKol (31 A. R. O. daughters, 2 above 30 lbs.). Every dam in her 4-generation pedigree has a good A. R. O. record.

The Sire of This Young Bull is Mutual Fobes Longfield DeKol 82959, a son of Mooie Mutual DeKol and from a daughter of Homestead Jr. DeKol that, as a Jr. 3-yr.-old, made 30.04 lbs. butter, 630.8 lbs. milk in 7 days and 124.42 lbs. butter, 2,651.6 lbs. milk in 30 days.

This youngster is well marked and as straight as they make them; so are his sire and dam. Moreover, he's a descendant of proven producers from one end of his pedigree to the other. His dam's record as a 3-yr.-old is bound to be increased. There's no question but that he'll prove to be a top notch herd sire. He was born April 10, '18. Write us about him today, for he won't be here long.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

Need a Herd Sire?

We Are Offering One of His Sons, a Real One, From a 27-lb. Dam.

His Sire is Iowana Sir Ollie, shown above, a son of Canary Paul Fobes Homestead, he a 34.96-lb. son of Canary Paul. Iowana Sir Ollie is from Ollie Watson Prima Donna, 3 times an Ass'n prize winner with 31.10 lbs. butter and 618.7 lbs. milk in 7 days to her credit. More than that he is a wonderful individual, a bull that would show to advantage in any ring today.

The Dam of this young bull is Groveland Korndyke Cornucopia, 27.71 lbs. butter and 624 lbs. milk in 7 days. She is a daughter of Cornucopia Pontiac Johanna Lad, one of the good sons of King of the Pontiacs, and from an A. R. O. granddaughter of Sir Korndyke Manor DeKol (45 A. R. O. daughters, 3 above 30 lbs.).

This Young bull was born April 8, '18. He's well marked, about half white, and a fine individual,—a bull that really will make you an excellent herd sire. Finally, he's priced to sell.

Remember we stand back of every animal we sell. Write today for picture, pedigree and price.

J. D. McDONALD, WEST SALEM, WISCONSIN.

A Bull That Will Suit You

He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna Kol. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show —took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is ked by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been cing for. Other young bulls by the same sire and from A. R. O. dams for sale. Write

YSIDE STOCK FARMS, A. L. Williams, Est., C. A. Williams, Exec. Fond du Lac, Wisconsin.

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Rock River Valley Farm

Awarded

FIRST PRIZE

In Wisconsin Dairy Cow Competition

The *Winner, Queen Juliana Dirkje,* produced in one year as a 3-year-old 1,021.72 lbs. butter, (80% fat.) Over 30 yearly record cows in herd headed by Mutual Piebe DeKol.

A few young bull calves from these cows sired by this bull for sale. (Herd tuberculin tested.)

JOHN HETTS, FORT ATKINSON, WIS.

CLEVELAND HERD

Offers Two Holstein Bull Calves

nine months old, good straight individuals, well grown. One is out of a 29.08-lb. 3-year-old, next dam a 26.10-lb. cow and the other out of a 20.33-lb. Jr. 2-year-old daughter of a 29-lb. cow. Both calves are sired by our K. V. P. Alcartra whose eight nearest dams average 30.52 lbs. butter from 611 lbs. milk. Also a few young A. R. O. cows bred to this bull and sired by King Segis Pontiac Veeman, one of the greatest sires of prize winning daughters in the world. If interested send for pedigrees, pictures and prices.

H. R. WEISKOPF, CLEVELAND, WIS.

Holstein Cattle

In Carloads or Less

Ages ranging from 6 months to 8 years. Telephone, 491 East Troy Exchange.

JOHN MURPHY, R. 27, Eagle, Wisconsin

$25 Holsteins $25

Five weeks old 15-16 pure, mostly white, $25 crated. Two months old, $40. Registered Bulls two months old best quality $65. Two-year springers $125. Cows crated $150. Write us for car lots. Buy the best—it pays in the end.

DR. J. A. ROBERTS STOCK FARMS,
OCONOMOWOC, WISCONSIN.

Pure-bred and High Grade Holsteins

CAN FURNISH CAR LOTS OR LESS.

I have a car of yearlings on hand at $50 each. Several bulls from 8 months to 14 months old from A. R. O. dams. Write me for price and photo. High grade Holstein heifer calves, four weeks old, $20 crated.

Yohn's Stock Farm, Watertown, Wisconsin.

YOUNG BULL FOR SALE

I am now offering an excellent young bull dropped February 27.

His Sire: A son of King Segis Pontiac Polkadot, that has 100% the same breeding as K. S. P. Alcartra, and from one of the good daughters of Korndyke Wayne Paul De Kol. **His Dam:** Rosa Queen Herbert De Kol, a 22.5 lb. junior, 4-year-old. This calf is well grown and a remarkably fine individual.

A few other bulls up to 11 months old, and several females for sale. Every animal guaranteed.

HALSEY SEDGWICK, Limeridge, Wis.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.

Highland View Place, - Whitewater, Wis.

Holstein Pedigrees

To Holstein breeders who appreciate promptness and accuracy in pedigree work, the *Wisconsin Live Stock Advertising Co* will render a genuine service.

We make a specialty of *sale catalogs.* Our price is $2.50 a page including pedigree for lots of 500. Write for particulars.

WISCONSIN LIVE STOCK ADV. CO.
413-14-15-16 Pioneer Bldg., Madison, Wis.

Lisle Farms Co.

OWNERS

Het Loo Pietertje

World's Champion Jr. 2-year-old.

Holstein Bull Calves of very best breeding.
Write for bull sale list.

H. C. Barker, Herd Mgr., Lisle, Illinois.
Farm 25 miles West of Chicago C. B. & Q. R. R.

Buffalo Creek Farm

OFFERS A SON OF

Prince Hengerveld Fayne No. 77461

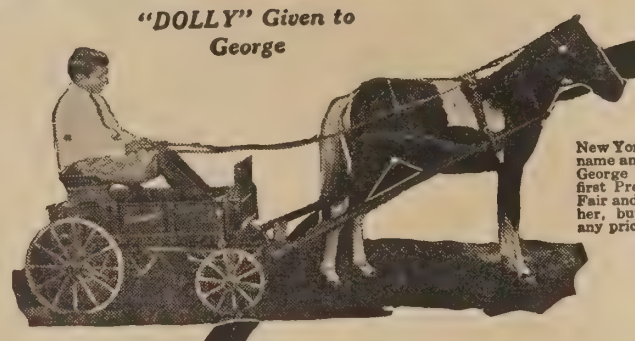
A 33-lb. son of King Fayne Segis. Dam's record is 18 lbs. as a 2-year-old and 24 lbs. as a 3-year-old, with a semi-official record of 13,471 lbs. of milk and 520 lbs. of butter. Pedigree and price on request. **Albert R. T. Lillie, Supt.,**
Arlington Heights, Illinois.

MILLIONS

Of dairy cows have been slaughtered in the old world. When this war is over dairy cows and products will command unheard of prices. Now is the time to get in. Send for our free price list of 100 head of choice females or if interested in a bull ask for bull list.

WOODLAWN FARM, Sterling, Illinois.

Purebred HOLSTEINS



are the most profitable dairy breed. They are the direct result of a consistently scientific testing and breeding system that in a number of years has raised their 7-day butter-fat record from 21 lbs. to over 50 lbs. Their history should be an incentive to every dairyman to improve his own herd by testing his cows, discarding the poor ones and filling their places with pure-bred Holstein Cows. Investigate the large Black and Whites.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Who Wants a Pony?

"DOLLY" Given to George

This is George Edwin Adams of New York State. He sent me his name and I sent him "Dolly." George says "Dolly" took the first Premium at the County Fair and he was offered $150 for her, but he would not sell at any price.

"EARLY BIRD" Given to Edwin

Edwin Larson sent me his name and received "Early Bird." Edwin says "Early Bird" is a fine name for his pony because he and his friends go for early morning rides in the summer. Edwin lives in Worcester County, Massachusetts.

"HEINIE" Given to Clarence

Clarence Niemoeller, Bartholomew Co., Indiana, sent me his name and I sent him "Heinie." Clarence says, "I would not take $10,000 for "Heinie," for I've more pleasure out of my pony than I would out of the money."

Boys and Girls

Here is the chance you have been waiting for—to get a real live playful Shetland Pony without a cent of cost.

"TRUSTY" Given to Raymond

Raymond Krueger lives in Minnesota, where there is much snow. However, Raymond, doesn't worry since I sent him "Trusty." If Raymond had not sent me his name, he wouldn't have "Trusty" now.

I Have Given Away Over 500 Ponies

I am called the Pony King of America because I give away Ponies to Boys and Girls. I have already given away over 500 Ponies to over 500 Boys and Girls.

Now I am going to give away several more Ponies, and I want every family that reads this paper to have an equal chance. If you are a boy or girl send in your name, and if you are the father or mother of a boy or girl, be sure to send your child's name. Remember, no charges of any kind and nothing to buy. JUST SEND IN YOUR NAME.

Here you see Anna Ruth Miller of Logan County, Ohio, and her new friend "Kip." Anna Ruth says she is glad she sent me her name because "Kip" is the finest Pony in the whole state of Ohio.

Every Boy and Girl Has the Same Good Chance

No matter where you live, no matter how young, every child will stand the same good chance to get a Pony, with buggy, harness, saddle, bridle and blanket. Send in your name right now.

Children Don't put off this chance. Don't wait. Write your name and address in the corner below, cut it out and send it to me. I will then send you the **Free Pony Pictures** and you will have an equal chance to receive one of the Real Live Ponies that I am giving away soon. You stand just the same chance as any other child, and it doesn't cost you a cent. Get a pencil and write your name NOW.

Parents Please show this offer to your child and send in the coupon. You will be interested in the Free Pony Pictures I send and your child will enjoy it immensely and profit by it. Besides **your child may win** one of the Shetland Ponies I am **actually giving away** this season.

"PAT" Given to Flossie

Little Flossie Meredith looks as though she is training for a circus, but she is just having good times with "Pat," the pony I sent her. Flossie lives in Jasper Co., Iowa.

It looks as though Ruth and "Mac" were also training for the circus. Ruth says he sticks his nose into a bag of pop-corn whenever he sees a pop-corn stand. Ruth Mead lives in Saline Co., Missouri. She sent in her name and received "Mac."

"MAC" Given to Ruth

Pony Pictures Free

I want to send a Colored Pony Picture Circular Free to every Boy and Girl that sends in his or her name. It gives the names and shows the pictures of the Ponies I am giving away. It also tells how to win one. I will send it free to every child who sends in his or her name.

The Pony King

321 Webb Bldg., ST. PAUL, MINN.

Write Your Name Here

THE PONY KING, 321 Webb Bldg., St. Paul, Minn.

Please send me the **Free Pony Pictures** and enter my name in your Pony Club. I want to get one of the ponies you are giving away.

My Name is.....

P. O. ..... Age.....

State..... R. F. D.....

The pony on the right is "Dapple," a beautiful little Shetland that I sent to Ernest Heckert, York County, Pa. "Dapple" traveled over 1000 miles to his new home. The picture shows Ernest driving "Dapple" in a Memorial Day parade in the little buggy that I sent with "Dapple."

If you want a pony like "Dapple" you had better send me your name right away.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin October 11, 1918 Vol. LV, No. 12

Why He Bought The Bond

I

I asked him why he bought the bond—this dairy friend of mine;
This homely, rugged son of soil, of cattle, and of 'shine.
Our weekly paper, for a month, had boosted up the loan,
And patriotic thrill ran high and pride in it had grown.
Perhaps 'twas duty calling him—and what the neighbors say—
Or plain, blunt urge of little groups that called on him each day.
He shook his head, and I could see my guesses all were wrong.
That bond was bought with soul and heart, keyed up to holy song.

II

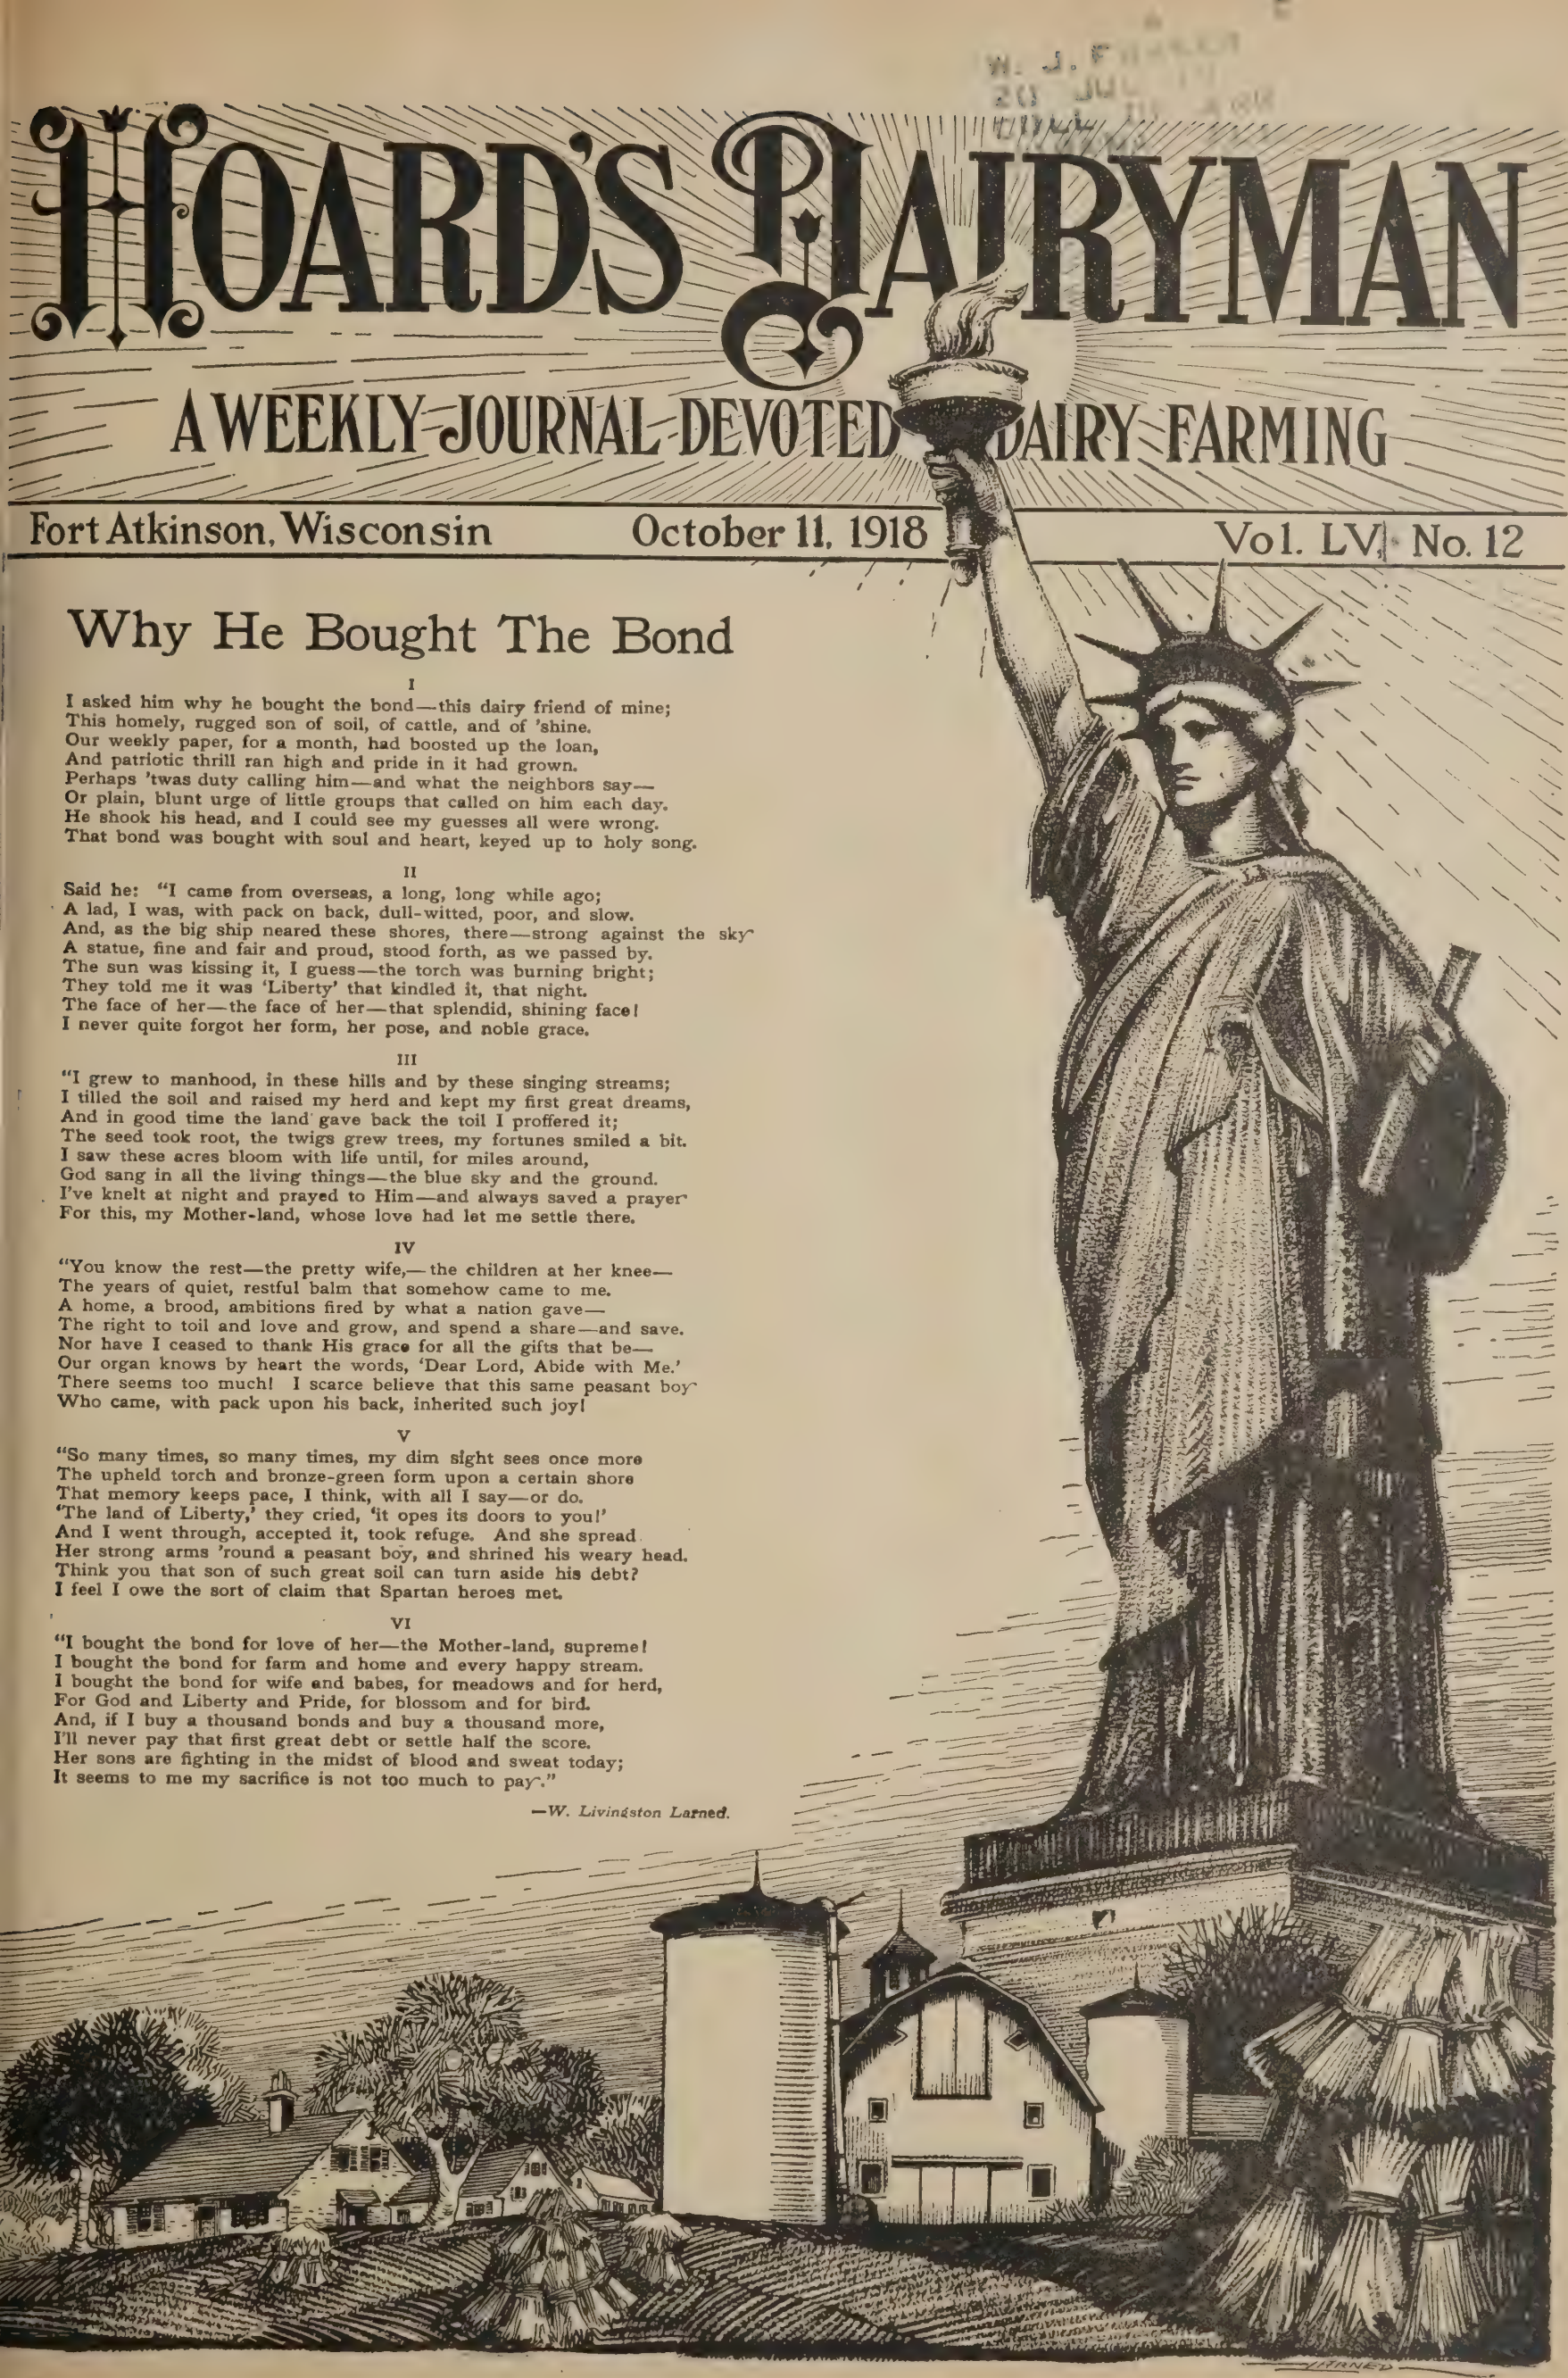
Said he: "I came from overseas, a long, long while ago;
A lad, I was, with pack on back, dull-witted, poor, and slow.
And, as the big ship neared these shores, there—strong against the sky
A statue, fine and fair and proud, stood forth, as we passed by.
The sun was kissing it, I guess—the torch was burning bright;
They told me it was 'Liberty' that kindled it, that night.
The face of her—the face of her—that splendid, shining face!
I never quite forgot her form, her pose, and noble grace.

III

"I grew to manhood, in these hills and by these singing streams;
I tilled the soil and raised my herd and kept my first great dreams,
And in good time the land gave back the toil I proffered it;
The seed took root, the twigs grew trees, my fortunes smiled a bit.
I saw these acres bloom with life until, for miles around,
God sang in all the living things—the blue sky and the ground.
I've knelt at night and prayed to Him—and always saved a prayer
For this, my Mother-land, whose love had let me settle there.

IV

"You know the rest—the pretty wife,—the children at her knee—
The years of quiet, restful balm that somehow came to me.
A home, a brood, ambitions fired by what a nation gave—
The right to toil and love and grow, and spend a share—and save.
Nor have I ceased to thank His grace for all the gifts that be—
Our organ knows by heart the words, 'Dear Lord, Abide with Me.'
There seems too much! I scarce believe that this same peasant boy
Who came, with pack upon his back, inherited such joy!



V

"So many times, so many times, my dim sight sees once more
The upheld torch and bronze-green form upon a certain shore
That memory keeps pace, I think, with all I say—or do.
'The land of Liberty,' they cried, 'it opes its doors to you!'
And I went through, accepted it, took refuge. And she spread
Her strong arms 'round a peasant boy, and shrined his weary head.
Think you that son of such great soil can turn aside his debt?
I feel I owe the sort of claim that Spartan heroes met.

VI

"I bought the bond for love of her—the Mother-land, supreme!
I bought the bond for farm and home and every happy stream.
I bought the bond for wife and babes, for meadows and for herd,
For God and Liberty and Pride, for blossom and for bird.
And, if I buy a thousand bonds and buy a thousand more,
I'll never pay that first great debt or settle half the score.
Her sons are fighting in the midst of blood and sweat today;
It seems to me my sacrifice is not too much to pay."

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

To Holstein Owners in Iowa

Those who are contemplating making seven- or thirty-day tests during the coming winter months will greatly facilitate matters if they will write to the Dairy Department, Iowa State College, Ames, Iowa, at once stating the probable time when such testing will begin. It is going to be a difficult proposition to find testers to do this work. In spite of war conditions, the work should be encouraged and it is hoped that more testing than ever can be done. To accomplish this, however, those in charge of the work must know some time in advance when testers are wanted in order that the most efficient use may be made of them.

H. F. JUDKINS.
Iowa Dairy Department.

Minnesota Farmers Own Bulls Co-operaetivly

A breeders' association has been formed in Millelacs County, Minnesota, to encourage the breeding of high grade Guernsey and Holstein cattle. Five groups of farmers have been organized, each group having 50 to 75 cows. A co-operative plan is in operation by which but one bull is used in each group. He is kept on the farm most centrally located and the keeper receives $50 a year for caring for him. The cost of feed and the original purchase price are divided equally among the farmers in the group.

Reports indicate that this system of securing high class bull service at a low cost is working very satisfactorily. According to present plans the bulls owned by different blocks will be interchanged to prevent inbreeding and to increase the period of the bulls' usefulness.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Buying of the Bonds

It's time to buy another bond, another proof of love,
The sort that thrills the heart of us, around that flag above.
It's time to lend a helping hand when lending means so much.
The mother-way of reaching out a mother's mood is such.
And all I have and all I own and all I hope to be
Will go to buy another bond for God and liberty.

It's time to buy another bond, a bond of noble right.
The dollars that were once in banks must help along th' fight.
Let's send away a regiment, our savings and our all,
It's not a day for selfishness when pride and duty call.
I've worked the tractor mighty hard, the crops have doubled, too,
Miss Liberty, I'll take a bond for very love of you!

It's time to buy another bond, a bond of Freeman's grit;
The dollar that's afraid to fight, has shamed you, son, and quit.
The farms were never half so fine. The soil is beckoning;
And treasures you have never known will blossom in th' spring.
Put all your own and all you are and all you hope to be
In bonds that bring the sort of peace that comes with victory.

"I've got an imported cow that just got over from the famous Island of Guernsey."

"What do you think of her?"

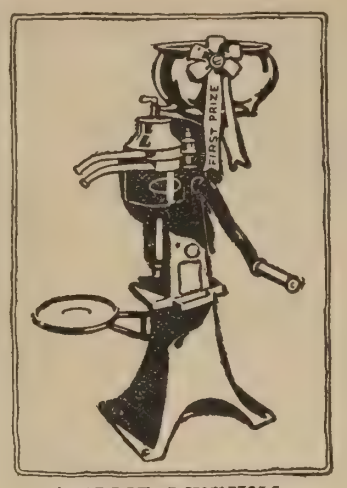
"Oh, she'll lead my herd once she gets over the affects of ridin' on the boat. She was sixteen days on the water and hasn't got over her sea legs yet.....the only time she's willing to be milked, is when my son stands at the barn door and makes a noise like a storm at sea."

"Fifty thousand tons of milk should be shipped abroad each fighting month of the year," remarked Hiram Weebly, of Clover Dairy, "and I know farm lads in uniform over there that won't be satisfied until they get moving pictures of the cows and phonograph record of a 'Moo' or two."

The Way It Works Out

Farmer Jones: "I hear all your summer boarders went back to the city last week."

Farmer Brown: "Yep. And if they'd stayed another month th' home folks would all have starved to death. It's been my observation that folks conserve food only when it's on their own table."



"This work or fight thing," remarked Uncle Ben Smudge of Hill Dale Dairy, "is interesting enough but there are so many hard jobs that th' young fellers would a heep sight ruther fight."

School Days

The boy must go away to school
And, say, I hate to see him go!
It's not until he is away,
That I begin to see th' way
He helps a feller so.
Those strong young arms are mighty fine,
To help get fence posts into line!

The boy has gone away to school
I miss him more than I can tell.
He's small—but there are many tasks
A farmer-father always asks
And that boys do so well.
His mother quietly allows
That he is great at milkin' cows!

The boy is working there at school,
And daddy misses 'Little Jim'.
His smiling face—his happy way;
The hopeful things he had to say;
The fine companionship of him.
His noon-time huggin'—and his kiss.

A PRIZE WINNING CREAM SEPARATOR

THE
DE LAVAL
CREAM
SEPARATOR
Is a Winner!

Why don't you let it win for you?

AT the great national and international expositions, the juries have invariably acknowledged the superiority of the De Laval. They awarded the Grand Prize, the highest possible award, to the De Laval at the Panama-Pacific Exposition at San Francisco in 1915, as also at Buffalo, Chicago, St. Louis, Paris, Brussels, and all the great world expositions for more than 35 years.

What the world's greatest dairy experts, the men who operate the creameries and the big milk plants and dairies, think of the De Laval is best evidenced by the fact that 98% of the cream separators in use in such plants the world over are of De Laval make.

De Laval Produced Cream Makes the Best Butter

Since 1892 the National Buttermakers' Association has held butter-scoring contests each year in connection with its Annual Convention, and at every such Convention butter made from cream separated by a De Laval Separator has scored highest. This is a 100% record for the De Laval. No room for chance there. Only unusual merit made such a record possible.

Proof of the superiority of De Laval Separators and of De Laval produced cream has been piled up and multiplied so many times that it is no longer questioned. It is an accepted fact.

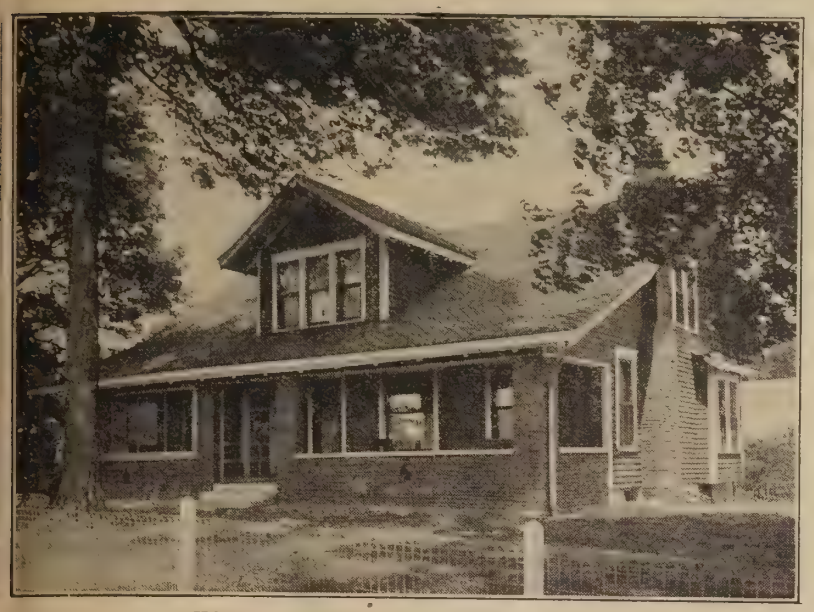
If you are without a cream separator, or in need of a better one, let the De Laval start winning a bigger cream profit for you NOW.

A PRIZE WINNING PRODUCT

See your De Laval agent immediately, or if you don't know him, address the nearest De Laval main office as below for any desired particulars.

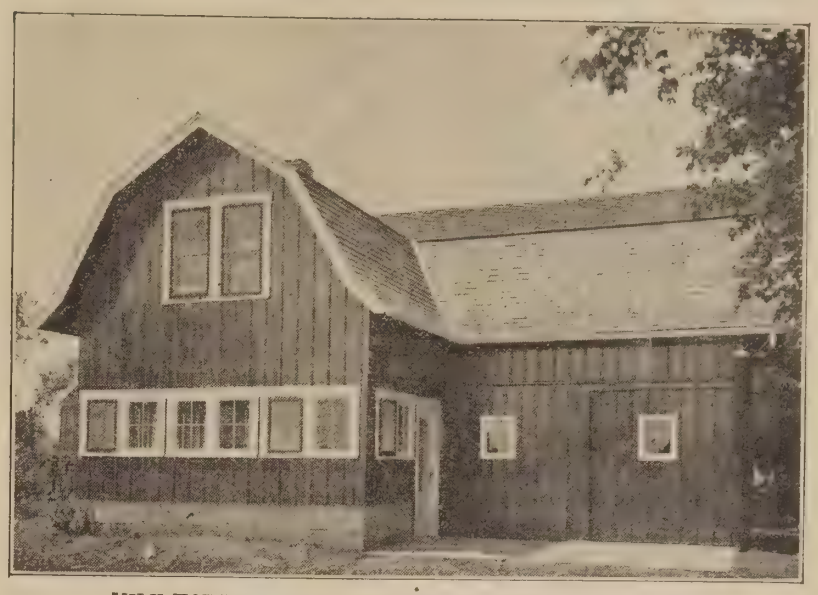
The De Laval Separator Company

165 Broadway, *New York*
29 E. Madison St., *Chicago*



The National Dairy Show
Columbus, Ohio, Oct. 10th-19th

Is the biggest event of the year in the Dairy Industry.

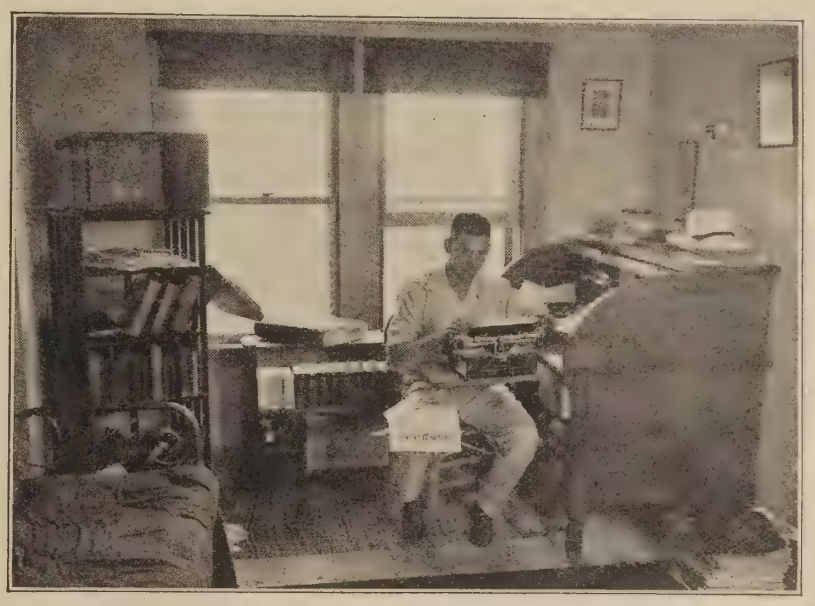


A full line of De Laval Separator, Milk Clarifiers, Whey Separators and Emulsors will be shown.

Come to Columbus
De Laval Bids You Welcome

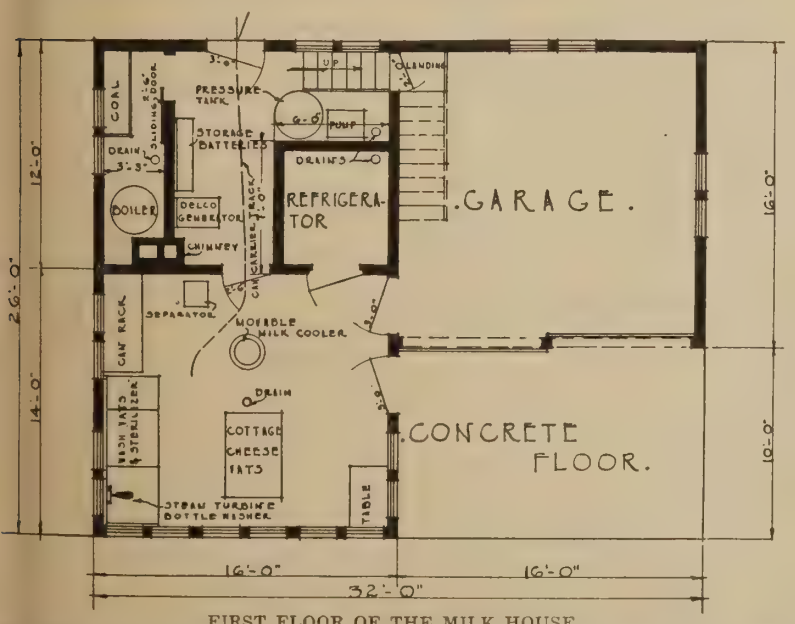
Where Crane Bros., Indiana, Produce Market Milk

HOME OF THE CRANE BROS.' PARENTS

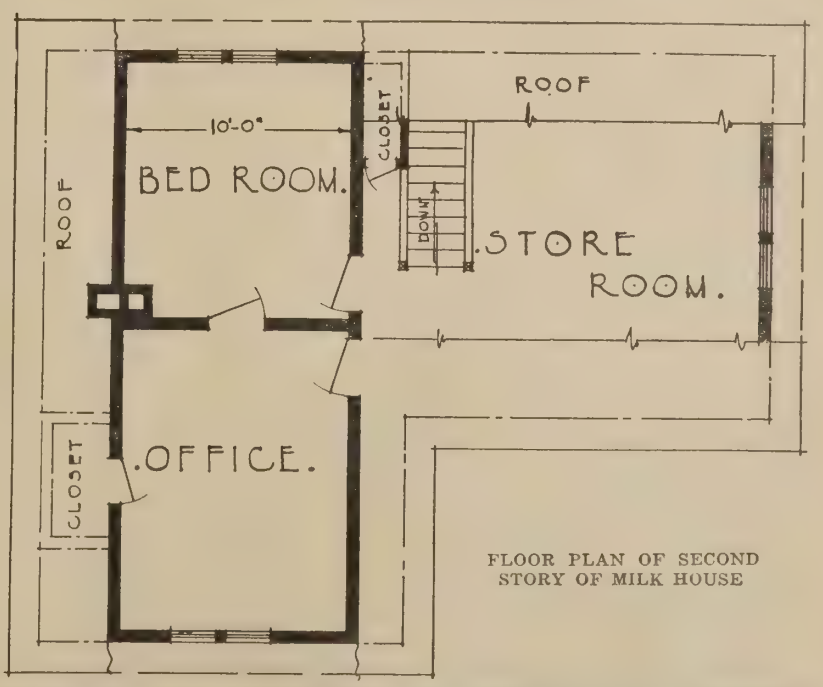


MILK HOUSE WHICH IS MODERN IN EVERY PARTICULAR

This building not only provides splendid facilities for bottling milk and cream and making cottage cheese, but also an office, bedroom, storehouse, a room for milk wagon, automobile, and a place for a dynamo which is used to light the farm buildings.



THE WORK ROOM OF THE MILK HOUSE



Milk is separated in this room; cream and milk bottled; cottage cheese made from the skimmilk; and milk bottles and dairy utensils washed.

THE OFFICE WHERE RECORDS OF THE HERD AND BUSINESS ARE KEPT AND LETTERS WRITTEN

FIRST FLOOR OF THE MILK HOUSE

FLOOR PLAN OF SECOND STORY OF MILK HOUSE

OME four years ago Crane Brothers formed a partnership for conducting a dairy farm on the old homestead in Indiana. They purchased foundation ck of pure-bred Guernseys of proven merit and insisted that they come from lthy herds. Although pure-bred stock was to be the major enterprise of farm, they early realized that they could build more profitable markets for ir milk and cream nearby than were then available. They sought the trade t buys more and pays more, and then catered to it. The new barns, comfort- y equipped, received first attention, but the growing demand for their milk l cream and cottage cheese finally brought forth the well equipped dairy nt illustrated above.

t is hard work to climb the ladder of dairy success when one must start m the bottom, and it has meant days of heavy physical labor and nights of nning for the Crane Brothers "to arrive". Without depreciating their own omplishment, these two men could scarcely have done what they have without the whole-hearted co-operation given by their wives. These splendid women have given of their time and ability to the upbuilding of the farm. They have swept and garnished the home. They have cooked and washed dishes for hungry men folks with open-air appetites. They have washed the babies and sang the lullabies as they dropped off from play time to sleepy land. Then, in addition to the manifold tasks of home making, they have helped out with the milking and have produced the cottage cheese that tastes so good that new customers clamor for more than the farm can produce.

Crane Farm is a happy family, an ideal and progressive dairy farm and home. The members of the family are young and full of the strength of youth and the camaraderie of good fellowship. It's the kind of farm one enjoys visiting for the lessons of farm management and good cattle, and when one leaves there are pleasant memories to dream about.

Reclaiming Farm Lands for Soldiers

ROBERT H. MOULTON, ILLINOIS

TO make part of the farm wealth of the nation an assured heritage of the men who fight the nation's war against Germany is the plan of Secretary Lane who urges a vast reclamation scheme to meet the requirements for returning soldiers after the war.

It is Secretary Lane's belief that the time has come when thought should be given to the preparation of plans for providing opportunity for these men. And because his department has handled similar problems in the past, he has made it his duty to bring the matter to the attention of the President and Congress. He points out that every country has found itself face to face with this problem at the close of a great war. From Rome under Caesar to France under Napoleon, down to even our own Civil War the problem arose as to what could be done with the soldiers mustered out of military service.

At the close of the Civil War America faced a somewhat similar situation. But fortunately at that time the public domain offered opportunity to the home returning soldiers. The great part the veterans of that war played in developing the West is one of our epics. The homestead law had been signed by President Lincoln in the second year of the war, so that out of our wealth in lands we had farms to offer the military veterans. It was also the era of transcontinental railway construction. It was likewise the period of rapid, yet broad and full, development of towns and communities and states.

CLEARING LAND FOR A DAIRY FARM IN OREGON. THERE ARE ALMOST COUNTLESS ACRES OF SIMILAR LAND IN THE UNITED STATES WHICH CAN BE TURNED INTO PAYING FARMS.

THIS WISCONSIN FARM WAS ONCE A SWAMP. RECLAMATION HAS MADE THE LAND VERY PRODUCTIVE AND VALUABLE. THERE ARE MANY THOUSANDS OF OTHER ACRES IN THE SAME AND OTHER STATES WHICH CAN BE RECLAIMED IN LIKE MANNER FOR SOLDIERS' FARMS.

From Soldier to Farmer

To the great number of returning soldiers in the present war land will undoubtedly offer the great and fundamental opportunity. The experience of war points out the lesson that our service men, because of army life, with its openness and activity, will largely seek out of door vocations and occupations.

This fact is accepted by the allied European nations. That is why their programs and policies of relocating and readjustment emphasize the opportunities on the land for the returning soldier. The question then is, "What land can be made available for farm homes for our soldiers?"

We have not the bountiful public domains of the '60s and '70s. In a literal sense, for the use of it on a generous scale for soldier farm homes as in the '60s, the public domain is gone. The official figures at the end of the fiscal year June 30, 1917, show that we have unappropriated land in the continental United States to the amount of 230,657,755 acres. It is safe to say that not one-half of this land will ever prove to be cultivatable in any sense. So we have no land in any way comparable to that in the public domain when Appomatox came and men turned westward with army rifle and roll blanket to begin life anew.

"No Man's Land" in America

While we do not have that matchless public domain of '65, we do have millions of acres of undeveloped lands in the northwest, lake states, and south, and also swamp lands in the middle west and south, which can be made available through their proper development. Much of this land can be made suitable for farm homes if properly handled.

But it will require that each type of land be dealt with in its own particular fashion. The arid land will require water, the cut-over land will require clearing, and the swamp land must be drained. Without any of these aids they remain largely "No Man's Land". The solution of these problems is no new thing. In the admirable achievement of the reclamation service in reclamation and drainage we have abundant proof of what can be done.

Looking toward the construction of additional projects, Secretary Lane announces that plans and investigations have been under way for some time. A survey and study has been in the course of consummation by the reclamation service on the great Colorado basin. That project, undoubtedly, will appeal to the new spirit of America. It would mean the conquest of an empire in the southwest. It is believed that more than 3,000,000 acres of arid land could be reclaimed by the completion of the upper and lower Colorado basin projects.

It has been officially estimated that more than 15,000,000 acres of irrigable land now remain in the government's hands. This is the great remaining storehouse of government land for reclamation. Under what policy and program millions of these acres could be reclaimed for future farms and homes remains for legislation to determine.

PERHAPS THE RETURNING SOLDIER EXPERIENCED A SHORTAGE OF SUGAR WHILE "OVER THERE". ON RECLAIMED LAND IN IDAHO HE CAN RAISE SUGAR BEETS LIKE THESE AND CATER TO HIS POCKETBOOK AND SWEET TOOTH AT THE SAME TIME.

Available Swamp Lands

The amount of swamp and cut-over lands in the United States availabl for farming is extensive. Just ho much there is has never been d termined with any degree of accurac Practically all of it ha passed into privat ownership. For tha reason, in considerin its use, it would b necessary to work ou a policy between th private owners and th government unless th land was purchase It has been estimate that the total area swamp and overflowe lands in the Unite States is between 70 000,000 and 80,000,0 acres. Of this amou about 60,000,000 acr can be reclaimed an made profitable for a riculture.

The undeveloped swamp lands lie chie ly in Florida, in th states along the Atla tic and gulf coasts, the Mississippi delt and in Missouri, Ind ana, Michigan, Minn sota, Wisconsin, a California.

What amount of la in its natural state unfit for far homes can be made suitable for cult vation by drainage only thorou surveys and studies can develop. is known, however, that authentic fi ures show more than 15,000,000 acr have been reclaimed for profitab farming, most of which lies in t Mississippi river valley.

Millions of Acres of Cut-over Lan

The amount of cut-over lands in t United States, of course, it is impo sible even in approximation to es mate. These lands, however, largely in the South Atlantic and gu states, the lake states, and the nort western states. A rough estimate their number is about 200,000,0 acres—that is, of land suitable f agricultural development. Substa tially all of this cut-over or logged- land is in private ownership. T failure of this land to be develop is largely due to inadequate meth of approach. Unless a new policy development is worked out in co-ope ation between the federal governme the states, and the individual owne a greater part of it will remain u settled and uncultivated.

The undeveloped cut-over lands chiefly in the Pacific northwest (p ticularly in Washington and Oregon in the lake states (Minnesota, Mic igan, and Wisconsin), and in the Sou Atlantic and gulf coastal states (V ginia, North and South Carolin Georgia, Florida, Alabama, Miss sippi, Louisiana, and Texas).

A New Policy Demanded

Care of the Milking Machine

C. LARSEN, South Dakota College of Agriculture

THE milking machine like any other piece of machinery must be kept in good condition to do its best work. Just recently I talked with a man who was milking about 40 cows by machine. He said: "The first month I had the machine it worked fine, but it kept milking slower and slower, so I increased the speed and it seemed to help for a few days. Then it got to milking slow again. Now I have the speed of it twice as great as is recommended in the directions, and I milk them out in a hurry." This is a big strong man who believes in doing everything by might. No one can milk a cow by machine by determination and strength. I did not have an opportunity to find out what the trouble in this instance was, but I believe I could come near telling what might be the trouble.

Vacuum Should Be Steady

This particular machine was not of the pipe-line type. The vacuum or suction was created in a small pump located on the stanchion frame in front of the cows. Probably the ring on the end of the plunger had become dry, stiff, and even worn. In some climates, dry and high altitudes, leather and rubber will dry out much quicker than in lower and more moist climate. In this condition it was not able to produce the sufficient and proper amount of suction.

Maybe the machine milked the easy cows too fast at first, and the excess of milk went up into the pumps. This would happen only with the easy milkers. The effect of it, however, would be equally bad if it happened every milking time with one or two cows in the herd. The leather or rubber rings on the plunger would become very soft, greasy, and loose of form. This would also cause a lack of vacuum.

Maybe he forgot to shut the pit cock in the end of the pump. This would release considerable of the vacuum. In fact, this draincock is there for drainage, and to be closed when hard milking cows are being milked, and to be opened when easy milking cows are to be milked. This latter prevents the milk from running over into the pump.

Leaky Teat Cups and Rubber Tubes

After the vacuum is generated and produced in exact amount, it must be made to apply on the cows in that force. If it has been determined from numerous experiments that 16 inches is the proper amount of vacuum for milking, then 16 inches should be made effective. To generate 16 inches and closely watch that the indicator stays on that mark during the milking time, and then allow 3 or 4 inches of this suction to get away through leaks, will necessarily make any machine do slow milking or improper milking.

Most of the machines have special rubber rings at the top of the teat cups. These in time will get out of shape and become ineffective. These rings are inexpensive and should be replaced when there is need for it.

Some of the teat cups have an inner sleeve or a complete rubber wall separating the inner part of the teat cup into two complete compartments. At times these rubbers spring a leak. At times these leaks are very small. When the rubber is not stretched, these leaks can scarcely be noticed. They are similar to a puncture in an automobile tubing, difficult to find.

Such leaks may interfere with rapidity of milking and with some machines they may interfere with the proper balance between the two sides of the rubber wall.

The rubber tubing leading from the vacuum pipes to the milking pail or machine may also leak. Likewise, the rubber tubes leading from the pail to the cow may become leaky. These latter tubes are more likely to be at fault than is the one leading from the vacuum pipe to the pail. The tubes leading from the pail to the cow are not so heavy. They are taken apart from the rest of the machine each day. They are heated and washed twice every day. This, in time, will cause any rubber to weaken. The tube running from the vacuum pipe to the pail is made of heavier material. It does not come in contact with the milk except when the pail is milked too full. It is not subjected to so severe cleaning methods, as are the rubber tubes coming in direct contact with the milk.

The Pulsator Should be Watched

It is not an uncommon thing to have a pulsator stop or work with irregularity. The most common cause of this is thick lubricating oil. In the winter and in a cold barn even thin oil will stiffen enough to interfere with the proper working of the pulsator.

After a time the pulsator will "gum up". It should then be taken apart and the hard, accumulated grease should be scraped off and all parts cleaned with kerosene.

The pulsator has minute port holes. These are very small and may easily clog. These, together with all the parts of the pulsator, should be kept clean and in good working condition.

The pulsator is one of the vital operative parts of the machine. It is finely adjusted, and it should be treated accordingly.

MILKING BY HAND INTO A PARTIALLY COVERED PAIL. THE AIM IS TO MILK ONE-HALF THE HERD BY HAND AND THE OTHER HALF BY MACHINE

Sanitation Important in Machine Milking

When the question of keeping milking machines in good sanitary condition comes up, then some prospective users think that this is the worst part in connection with mechanical milking. The worry, however, subsides when the customer is told that some certain disinfectant is used, and that by keeping the different parts of the milking machine in this disinfectant solution between milkings no difficulties are encountered. That suggestion is quieting. It is like pouring oil on the troubled water. However, the cleaning of milking machines should not be faced in that light. The cleaning of milking machines is no different from the cleaning of any other dairy utensil.

A VIEW OF THE FIRST MILKING MACHINE OPERATED IN THE SOUTH DAKOTA STATE COLLEGE DAIRY BARN

One day a prospective farmer came to the college dairy barns. He looked at the various pipes used for conducting the vacuum. He said: "Do all of these pipes belong to the milking machine?" He was informed they did. "I should think it would be an awful job to keep all of those pipes clean. I should think they would get to stinking in this hot weather." He is not the only prospective user of milking machines who magnifies the task of keeping a milking machine in a sanitary condition.

Not Many Parts to Clean

A milking machine can not be kept sanitary alone by soaking the parts in a disinfectant, or is there any need of making a mountain of difficulties over the cleaning of a milking machine.

Any person owning enough cows to purchase a milking machine should be reasonably well prepared with cleaning facilities, such as hot water, a good washing compound, and a small container or vat for this purpose. The washing room should also be provided with a vacuum pipe and proper shut-off and attachment.

There are only a few parts to be kept clean and these parts are not difficult to get at.

Steps in Washing

When the milking is completed, the different machines or pails are taken to the wash room. This wash room is equipped with a small five horse power, upright, submerged flue boiler. When purchased it cost $100, and I believe that every dairyman who makes dairying a business at all should have similar facilities for plenty of steam and hot water. In addition it furnishes a place for drying things, it keeps water and pipes from freezing, and it also furnishes a comfortable place for the help to do the cleaning of the separator, pails, etc.

This wash room also has in it a small vat having two compartments, one for hot, clean water to be used for rinsing, and the other for warm water containing the washing powder. A water supply pipe and a steam pipe lead up to the center of the vat on the wall side.

(Continued on page 368)

EXTERIOR AND INTERIOR VIEWS OF THE SOUTH DAKOTA STATE COLLEGE DAIRY BARN

The main part faces south. It is 140x40 ft. It is used for box stalls, feed rooms, and calf pens. The part containing the cows runs north and south. It is 112x40 ft. The other portion contains running shed, judging room, and experimental barn. There are four silos on the north. Cows have no pasture, but are fed on silage and alfalfa hay.

Southwestern Jersey Cattle Show

H. E. COLBY, MISSOURI

THE Jersey is the most popular and favorite dairy breed of the Southwest. This territory covers the larger part of Missouri and sections of the surrounding states that are devoted to the dairy industry. This qualification of the above statement is well taken, for the beef breeds have reigned supreme since the Southwest became prominent agriculturally. The mere fact that the dairy cow is supplanting other forms of farming promises much for the future of this part of the country for it is a recognized fact that dairying always brings prosperity to those who follow it systematically.

A very prominent reason for the Jersey's popularity here is found in the class of men who are pioneers in the adoption of the breed, and at the head of this list are three leaders of national reputation, J. E. Jones, the Longview Farm, and F. J. Bannister, all of Missouri. These men made possible and stood sponsor for the only exclusive Jersey show of national significance that has been held in this country. The three herds owned by these gentlemen are recognized as premiers in the breed all through this section west of the Mississippi.

The Southwestern Jersey Show was put on at Kansas City September 17 to 21. The reason for its inauguration this year is found in the necessity of fostering and encouraging dairy breed sentiment. The season was by no means propitious for such a venture, but from the standpoint of the breeder the show was a remarkable success for it assembled some of the choicest herds in the land.

The week opened with a banquet given by the Southwest Jersey Breeders' Association. The two features of the occasion were an address by M. D. Munn, who was a guest of the association, and the display of the moving picture reel known as "Hearts and Jerseys" in which May Irwin and her herd of registered Jersey cattle were the characters.

Mr. Munn spoke with his usual eloquence and enthusiasm in behalf of the dairy industry. He emphasized, particularly, the supreme necessity of encouraging dairying, not alone from the standpoint of agricultural economy, but more especially from that of the conservation of humanity. He pointed out the fact that the human race on both sides of the ocean must have more dairy products if healthy, strong, vigorous people are to be raised up to take the place of the flower of manhood that is being sacrificed in the cause of human liberty. Unless something is done to guard against it, there is a danger that future generations will be weaklings because those of most perfect and robust health are giving up their lives in this great world war. This in itself is an important reason for the most careful and judicial nourishment of the children of today, and that nourishment demands dairy products. Thus it is a patriotic duty for the farmers of America to provide this sort of food.

The social feature of the show was provided by the horse shows which were given in the evenings. These were put on by the Loula Long Stables which are internationally famous. The arena is splendidly adapted to a show of this kind, and every class was superlatively excellent.

The premium list for the Jersey show was liberal, and the herds competing for prize money and popularity came from the Falfurrias Jersey Farm of Texas, the White City Jersey Farm of Oklahoma, and the Belleview and Longview Farms, both of Missouri. There were also entries by Frank Knopf of Kansas and a single entry by Dr. J. C. Klumph of Missouri.

Mr. Knopf is entitled to a word of congratulation for his is a small herd and he did not have the opportunity to make the selection that he would like in picking his show herd. He is starting in the business of breeding Jerseys, and at the present time has only thirteen registered animals. From these he selected a few individuals that were good enough to win some of the prizes in competition with the prominent herds exhibited. In the class of bulls, one year old and under two, he took fifth prize with Countess Lad's Majesty, a son of Financial Countess Lad, and his bull calf under six months of age won third prize in a full class.

In the class of bulls four years old or over, Viola's Majesty's White Sox, shown by Longview, won the first place in his usual form. He has been a regular winner in the shows this year, as in the past, but he met one defeat when Poet's Whiteheart, the bull under three years from the same herd, was made senior and grand champion.

Among the bulls under two years Tulsa Chief, shown by the White City Jersey Farm, was winner of the blue ribbon, as he has been in all of the fairs where he has appeared this season. However, when it came to the junior championship honors, Noma's Perfect Raleigh, from the Longview herd, was the winner.

In the cow groups Willow's Brightness, from the Falfurrias herd, was the winner of first prize in the class five years or over. She was also champion and grand champion of the show. She showed in beautiful form and she truly approaches perfection of Jersey type.

The Belleview Farm did not have many entries, but the demand for these cattle in the sale which closed the show was unmistakable tribute to Mr. Jones' skill as a breeder.

W. S. Dixon, now of Connecticut but well known as a Wisconsin breeder and show man, made the awards. He was fearless and conscientious in his decisions and his experience as a competitor in the ring qualified him thoroughly for his task which was by no means an easy one. This was especially noticeable in the younger classes for the highest degree of quality and finish was seen there. This very fact speaks well for the future of Jersey interests all through the Southwest for it shows that the men who are breeding are constantly improving their herds in type and individuality, and the Register of Merit work that is being done here is eloquent commendation of the increase in productiveness of these herds.

The following are the awards in detail:

Bull 4 years or over—1, Longview Farm o

NOMA'S PERFECT RALEIGH, JUNIOR CHAMPION BULL AT THE SOUTHWESTERN JERSEY CATTLE SHOW
OWNED BY LONGVIEW FARM, MISSOURI

RALEIGH'S OXTIVITY, JUNIOR CHAMPION FEMALE AT THE SOUTHWESTERN JERSEY CATTLE SHOW
OWNED BY LONGVIEW FARM, MISSOURI

Feed Markets are Strong

SANDERS SOSLAND, MISSOURI

AFTER studying and watching feed markets for months, dairy interests still find a plenty to absorb their attention, and, incidentally, to dig deep into their bank accounts. Feed markets, as indicated long ago, now are at record levels and, even at the current heights, there is a very strong undertone.

Keen disappointment is manifest among both individual and community buyers in the bran and shorts situation. With the second largest wheat crop in history, which normally would provide a remarkably great amount of feed for dairymen, the trade is witnessing probably the most acute scarcity of mill offals in history. The eastern dairy districts, being farthest away from the larger milling sections of the country, feel greatest the shortage of bran and shorts. But even in the heart of Kansas, the leading flour milling state, complaints are numerous over the scarcity of mill offals.

What can be done to remedy the bran situation? Many measures might be taken by food officials at Washington but, no matter how numerous these measures may be, a return to normal conditions is impossible. Official Washington cannot remedy a situation brought about to a large degree by nature. It is well, however, again to emphasize that the United States Food Administration can aid the bran and shorts market, thereby assisting dairymen who are supplying a most essential food to both civilian and army demand. To accept more flour for export to Europe would be a beneficial forward step. Today, mills are not operating at more than 50 to 60 per cent normal capacity, due to the dull demand for flour. The opening of the export channels to flour millers would make possible enlarged milling activities, which, of course, would put a greater quantity of mill feeds on the market. It is unfortunate that action has not yet been taken in this direction.

Bran sells at a maximum price of $27.50 per ton at the mill door, sacked, basis Kansas City, while some mills having purchased their sacks at the reduced range, quote bran as low as $27.02 per ton. Shorts are selling in Kansas City at a range of $29.02 to $29.50; mixed feed, $28.33 to $28.75. The price at Minneapolis is $28.25 to $28.85 per ton; mixed feed, $29.50 to $30.25; and shorts or middlings, $30.50 to $31.

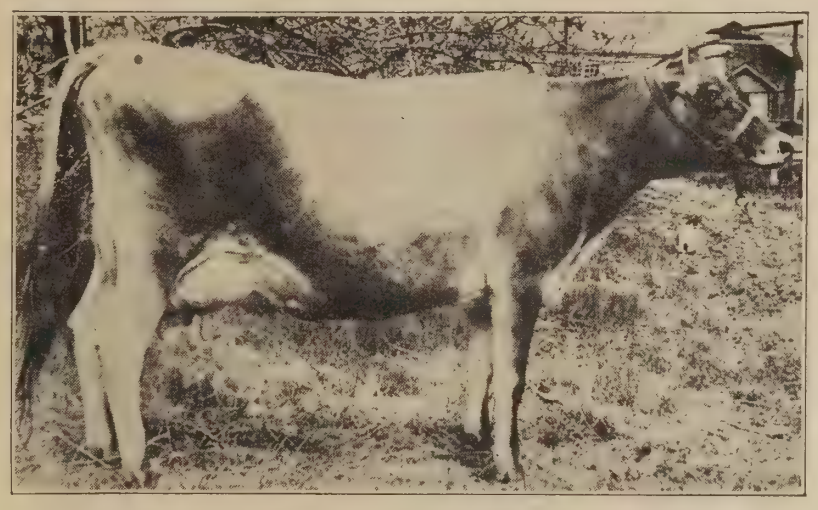
A yield of 2,672,000,000 bushels is the September forecast on the corn crop by the United States Department of Agriculture. This compares with a crop of 3,159,494,000 bushels in the preceding year, 2,566,927,000 bushels in 1916, and 2,994,793,000 bushels in 1915. It is probable that more corn of the 1918 crop will be in merchantable shape than a year ago, when frost caused heavy damage. The coarse grain already has passed the frost stage in practically all producing sections.

Of interest in the corn market was the recent announcement by the Food Administration modifying the amount of substitutes required in baking bread from a "50-50" basis for housewives and "75-25" for bakers to an "80-20" basis for both. While this means that less corn will be used for human consumption, the amount will be large enough to influence prices. Feeding demand for corn is heavy, particularly in Kansas, Missouri, Nebraska, Oklahoma, and other southwestern states where the crop is less than half of a year ago. Live stock production is increasing—and demand for corn, the principal fattening commodity, will be the greatest on record. Prices range from $1.50 to $1.90 per bushel in Kansas City and $1.33 to $1.85 in Chicago at this writing.

Oats will play a more important part in feed markets than has been the case in the last few years. Owing to the high level of corn, many feeders are substituting oats, which is selling at a range of 71 to 75 cents a bushel in Chicago and 70 to 80 cents in Kansas City. Demand for oats to feed the thousands of war animals is huge. The September report of the Department of Agriculture indicated an oats crop of 1,477,000,000 bushels, compared with a final yield in 1917 of 1,587,286,000 bushels, 1,251,837,000 bushels in 1916, and 1,549,037,000 bushels in 1915.

Sharp advances have occurred the past month in prices for alfalfa and other varieties of hay. In Kansas City, the greatest alfalfa market in the world, $33 per ton is being paid for choice alfalfa hay, only $2 under the record height scored last winter. Talk of $40 for alfalfa is common among close students of hay trade conditions. Only a few cars are selling under $29 per ton.

Arrivals of alfalfa hay from producing sections are moderate, though less than a year ago. In the face of drouth in the Southwest, feeders and breeders of live stock require large quantities of alfalfa hay. The shortage of bran and shorts also has augmented the domestic demand for alfalfa. This abnormal buying, together with army demands and the fact that yields of the legume were not more than 50 per cent of normal in the important producing districts of the Southwest and West, has naturally tended to boost prices. The East and Southeast are taking large quantities of hay from Kansas City's territory.



Alfalfa meal, the hay in pulverized form, continues to advance in importance. Dairymen in the East who are unable to obtain bran are substituting alfalfa meal and report success with the product. In Kansas City, which also has attained leadership in distribution of meal, prices range from $34 to $42 per ton. These prices are really relatively lower than the hay, and many consumers are taking advantage of the situation by making large purchases. A good demand prevails from the East and Southeast, as well as from the Southwest and South. Little alfalfa meal will be milled in Oklahoma this season, owing to short yields in the state. Kansas City's supply will be derived principally from Kansas and Colorado, but even these states will grind far less meal than a year ago.

A moderate to good demand prevails for alfalfa molasses and alfalfa grain molasses feed. Prices on the straight molasses mixture range from $39 to $45 per ton, basis Kansas City, and $49 to $58 per ton on the grain mixture. The fact that the alfalfa mixed feeds are selling at a comparatively lower level than straight grain feeds and cottonseed meal, has helped the trade.

Uncertainty describes the situation in cottonseed feeds. Prices at which mills may sell new crop cottonseed meal and cake have been fixed by the United States Food Administration at a range of $50 to $57 at Oklahoma and Texas points, and $53 to $60 per ton in Arkansas and points eastward. These prices, of course, are basis mill door. However, crushers are generally dissatisfied with the government price, declaring they would be forced to operate at a loss of $2 per ton at the present level for seed. Only a very small amount of cottonseed cake and meal may be obtained, that which is available coming almost exclusively from South Texas mills. The large crushers and many of the smaller ones are refusing to make offers on the present government basis, and are seeking an advance in the price. It is unlikely that an advance will be granted by food officials. An enormous demand prevails for cottonseed meal. The yield of cotton in the United States is now estimated by federal authorities at 11,100,000 bales, compared with 11,300,000 bales in 1917 and 13,000,000 is the five-year-average during the 1912-16 period. The first government estimate on the 1918 cotton crop indicated a yield of more than 16,000,000 bales, but drouth reduced this figure, and the expected feed yield. Because of the short yield, seed is scarce throughout the South, and with an acute shortage of labor, mills are handicapped.

The outlook for supplies of linseed meal is not as bright as for cottonseed feeds. The estimated flax production in America is 15,900,000 bushels, against 11,000,000 bushels in 1917 and a five-year average of 17,600,000 bushels. However, flax imports are still restricted by the War Trade Board, so the amount of seed available for crushers is light. Oil meal is selling at practically $60 a ton, basis Minneapolis. Mills are sold up for September and are making few new offers.

Because of recent advances in prices, there may be a tendency among dairymen to delay purchases until a price reaction occurs. This was the case a year ago. In the waiting—voluntary until the winter months, but forced after low temperatures set in—consumers witnessed advances to more dizzy heights, the hoped for reaction failing to develop until pastures became available the next spring. The feedstuff trade was not in as bullish a condition a year ago as today, owing to heavy crop losses and increased feeding of live stock. Is this, then, a time for waiting?

"HOPE YOU'LL DO"—PAIL FILLER AND RIBBON WINNER

Hugh Bonnell of Ohio has a Jersey cow that has made three consecutive yearly records aggregating over 1,515 pounds of fat, which gives her a good start for a trial at the "long distance" record. She is already the best cow in Ohio at this game, age considered. Her three official Register of Merit records are as follows:

	Milk Lbs.	Fat Lbs.
At 2 yrs. 3 mos.	7,250.4	347.45
At 3 yrs. 6 mos.	12,445.9	597.27
At 2 yrs. 3 mos.	7,250.4	347.35
	31,872.3	1,515.45

Hope You'll Do took the red ribbon at the 1917 National Dairy Show for Register of Merit cow shown with two of her progeny. She is a well bred cow, being a daughter of Oxford You'll Do, a bull with forty-two tested daughters, and a granddaughter of Gamboge's Knight, a R. of M. bull having fifty-six tested daughters and twelve proven sons.—A. L. TICHANE, New York City.

Hardy Alfalfa in Canada

HOARD'S DAIRYMAN:—In a recent issue of Hoard's Dairyman, Mr. Jas. Lacey of Wisconsin asks, "Will alfalfa winter-kill?" and then adds some suggestions on ensuring the life of the stand. We have been asking ourselves the same question here in Canada for a long time. Our winters are unusually severe. When alfalfa was first introduced as a farm crop, failures were more frequent than successes and thousands who gave the crop a trial decided that one failure was enough. Others kept on and now we can find, even in the most unfavorable of our provinces, a few men who are making a success of alfalfa. In other sections alfalfa is now one of our standard crops. Last winter was the most severe that we have ever known and consequently there was never a better time than now to investigate the hardiness of alfalfa and to inquire into the factors which ensure it against winter-killing. Perhaps the results at some of our experimental stations may be of interest to readers of Hoard's Dairyman who have had trouble with winter-killing.

Climatic conditions in the Maritime provinces of Canada are certainly not favorable to alfalfa. The winters are open and alternate thawing and freezing of the soil is the rule. For many years, it was taken for granted that alfalfa could not possibly succeed. In recent years, however, many varieties of alfalfa have been tested and J. A. Clark, superintendent of the Experimental Station at Charlottetown on Prince Edward Island, reports that Grimm, Baltic, and Ontario Variegated have proved to be equally hardy and quite superior to common alfalfa. "Our experience with alfalfa for some nine seasons," writes Mr. Clark, "has led us to think that the crop is about as sure as red clover in this province."

Across the straits in Nova Scotia, Prof. J. M. Trueman, who first popularized O. P. V. ensilage, writes

of his experience with alfalfa as follows: "We have used two varieties of alfalfa in our field plots at the Nova Scotia Agricultural College, Grimm and Ontario Variegated. Both varieties came through the severe weather of last winter in good condition, while common red clover in adjoining plots was killed out completely."

The climate in the province of Quebec is much more severe than in the province of Ontario and certainly more severe than in the climate of Wisconsin. In Quebec, several hundred farmers who are members of the Agricultural Experiment Union, have tested various varieties of alfalfa and M. Leguori, secretary of the Union, reports that "we are glad of this opportunity to state again that alfalfa thrives well in all parts of the province and under all climates; under the climate of Montreal as well as under that of Abitibi and of Lake St. John district in the extreme north; in the eastern townships as well as on the Gaspe coast; but the ordinary conditions of success must not be neglected—deep soil, well tilled, well drained by natural or artificial means, free from acidity and free from weeds, especially couch grass."

Brother Leguori lays special emphasis on the selection of variety. The Grimm is his favorite. With this variety, under good conditions, practically no failures have been recorded during the last four years. Both Grimm and Ontario Variegated came through the severe weather of last winter without damage and if the weather keeps on being favorable, four crops are anticipated this year instead of the usual three.

At Macdonald College, Ste. Anne de Bellevue, Que., alfalfa has been probably more extensively experimented with than at any other institution in Canada. The past winter bore with unusual severity on alfalfa, grasses, and clovers. Most of the plots of red clover were killed, while a number of blocks of alfalfa sown broadcast and in rows, that have survived all winters since they were seeded in 1912 and 1913, have been from 75 to 90 per cent winter-killed. There were some plots, however, that came through with little damage and it was noticeable that those which had a good covering when winter set in, survived out of all proportion to the protection afforded. This is in line with Mr. Lacey's conclusions. Reviewing the results at Macdonald, Mr. Summerby of the Field Husbandry Department writes:

"The results of the tests this year under these severe conditions again strongly emphasize the importance of leaving a good growth to freeze down to hold the snow and protect the plants. In previous work with this crop a number of varieties, including the Grimm, showed themselves to be particularly hardy. This variety has again shown hardiness, but has been more severely winter-killed than ever before. A number of new and improved strains that are in the row tests, seem to be completely resistant to conditions as they existed this year, for, although on heavy soil with little aftermath and where ordinary alfalfa had frozen out almost every year, these new strains had not been winter-killed at all. Hardy varieties given good condition for wintering by making provision for after growth and drainage, seem to be the most important factors in preventing winter-killing."

A few years ago the writer visited this college and out of 100 rows of alfalfa that had survived several winters was asked to select the best. Some rows had been killed out completely, others had only a scattering of plants left. The 12 best rows had a perfect stand and after the selection was made, I was told that they were all Grimm.

In the province of Ontario where the most of the alfalfa in Canada is grown, stands were severely thinned this past winter. Practically all fields that were seeded with common alfalfa were almost completely winter-killed. Many fields of Ontario Variegated were badly thinned, but so far as we have been able to ascertain, alfalfa of the Grimm variety has shown wonderful hardiness. In fact, where the third crop was left to hold the snow and fall pasturing was not practiced, we have yet to hear of a single failure with Grimm alfalfa.

Reports from Western Canada emphasize the absolute necessity of hardy strains. Mr. W. Southworth of the Manitoba Agricultural College reports that out of about 40 different commercial strains from various sources, the only one which showed any real capacity to resist winter-killing was one from a Grimm strain and even in this strain a considerable percentage of plants were destroyed or considerably weakened. At this station, too, new varieties are being developed which show more resistance to winter-killing than any of the varieties that are now obtainable in commercial quantities.

In Saskatchewan, last winter was most trying and L. E. Kirk, in charge of forage crop work, reports successive winter-killing of the hardiest commercial varieties including much of the Grimm. The greatest injury, however, was sustained by the older plants, the seedings of 1917 suffering but little. Here, too, a good crop growth in the fall prevented much winter-killing. Mr. Kirk concludes his observations as follows: "Altogether our results serve to further emphasize the need of hardier strains of alfalfa and also to justify the use of Grimm as our hardier stock. Some sort of protection appears at present to be the best way to insure against winter-killing."

Reports from Alberta indicate the superiority of the Grimm and Baltic strains. In this province alfalfa has been grown successfully as far north as Fort Vermillion in the Peace River district, which is on the Arctic slope of the continent.

Summing up our experiences with alfalfa here in Canada, we are inclined to put variety first in ensuring against winter-killing and, so far, our hardiest variety has been the Grimm with Ontario Variegated a close second. Next in importance is the matter of winter protection. In some parts of Canada three crops of alfalfa are cut regularly, but in most districts it is safer to cut two crops and leave the third crop for winter protection. Our best growers are so strong in their belief as to the necessity of a good fall growth that they will not even pasture the third crop moderately and in this they are playing safe. The other factors of course must not be neglected, a non-acid soil, good drainage, inoculation, a well prepared seed bed, and light nurse crop. When all of these factors are given the consideration they deserve, alfalfa is an approved success in the major portion of our Canadian provinces and when it can be grown at all, in the Lake St. John's district of Quebec, or the Peace River district of Alberta, it should succeed admirably in any part of the northern states.

Ontario. F. E. ELLIS.

Holstein Organization in Stearns County, Minnesota

HOARD'S DAIRYMAN: — Stearns County, Minnesota, is developing a very strong and active Holstein Breeders' Association and gives evidence of being a very strong, popular Holstein center. The Holstein cattle have been carefully bred for many years in the county, but never before has so much interest been displayed as was in evidence during the recent county fair, when over 90 Holsteins were exhibited.

On the second day a sale was staged which proved very successful. Twenty-nine Holsteins were sold, nothing, including calves, selling for less than $100. Miss Kate Korndyke DeKol 217257, owned by Henry Borgman, brought the highest price at the sale, $435. Thomas Zaczkowski bought her.

Some very fine individuals were entered at the fair. Professor A. J. McGuire of the Agricultural College did the judging. The bull awarded the sweepstakes is a yearling bull of exceptional type for his age, owned by Henry Borgman. The bull is King Ollie Homestead 201617 and is a full brother to the grand champion Holstein bull at the 1918 Minnesota State Fair.

The cow winning the sweepstakes prize is Norma Pietertje Bell, owned by Joseph Luetmer. She has a record of 18 lbs. fat in 7 days, and has made over 10,000 lbs. of milk in 5 months.

Great enthusiasm for Holstein cattle was shown not only at the fair grounds, but also at a banquet for the Holstein Association. About fifty present and prospective Holstein breeders were at the banquet. Professor A. J. McGuire gave a very interesting talk, pointing out the qualities a good Holstein breeder should have, presenting them in the form of

More Dollars From Your Dairy

NOW You Can Get ALL the Butter-Fat Profits from Your Herd

YOUR cows are all right. The butter fat is in their milk, but you are wasting this precious profit by using old-fashioned separation methods or an old or inferior separator. Swedish farmers won't tolerate such extravagance. They have to make every penny possible. That's why the best cream separator in the world—the **Viking**—is made in Sweden. You can profit **at once** by the work they do. Start today. Get a

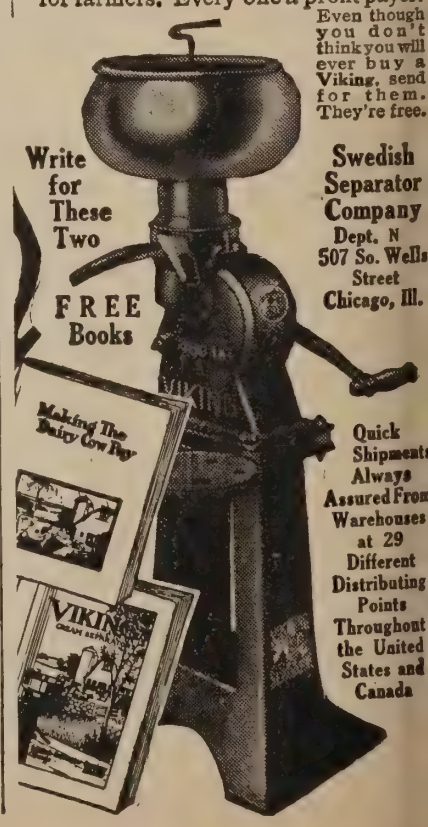
VIKING CREAM SEPARATOR

Made in the Largest Separator Factory in the World

It is **lower** in price and **greater** in capacity than other separators of equal rating. It is guaranteed to skim down to a mere trace. It gets you every possible penny's worth of butter fat that is in the milk.

More Than One Million In Use

In every country in the world where good dairying is conducted, you will find **Vikings**, not only because of the profitable work they do, but also because of their construction. Made of the finest Swedish iron and best tool steel, the **Viking** is



Guaranteed for a Lifetime

It is the simplest and easiest-running separator on the market today. Operation starts at a touch on the handle. Bowl cleaned thoroughly in 3 minutes. Investigate. Go to the **Viking** dealer in your town and see it in operation. Get our books. They are full of facts for farmers. Every one a profit payer.

Even though you don't think you will ever buy a Viking, send for them. They're free.

score card. To the head of the reeder he attached a high value in he management, feeding, and breed-ng of a good herd. The heart also vas given a high rating. The suc-essful breeder must have his whole eart in his work. The mouth, a irge one, to laud and advertise the alue and merits of his herd and the reed, is essential. Then also the nose; good nose should be had by every airy farmer, a very sensitive one, o the odors, etc., in the barn.

The county agent and several thers also spoke. The association is lanning on a spring show of Hol-tein cattle. Enthusiastic breeders re at the head of it. Mr. Thomas aczkowski is president and Mr. E. B. Ieller is the secretary.

Minnesota. E. M. GILLIG.

Farm Water Supply and Drainage

"There seem to be as many calls or information about farm house wa-er systems as for any other farm im-rovement," says Chas. G. McLain, ngineer of the Pennsylvania Depart-ient of Agriculture. "This shows an wakening of the farmer to improve-ients to help the housewife as well s to lighten her burdens. There is othing quite so hard as having to ravel anywhere from two to ten rods rom the house for water and then to arry the full pails back. The worst f it is that most springs are below he house and this water must be arried up the hill to the house.

"It is not very expensive to put in very good system and the pleasure s pay enough not considering the sav-ng of energy. If the women would efuse to carry the water, making the ien do it, I believe they would ac-omplish a lot towards getting some ind of a system.

"On the majority of farms there re springs at an elevation sufficient o get a good gravity system which is he best as the care after installation s practically nothing. But there are ther systems that are practical and reat labor savers.

"I have just been on a visit to a arm in Bradford County on which onsiderable underdraining has been lone under the direction of the de-artment of agriculture and I find he results are up to expectation.

"This field is in corn this year with a small area of oats and some spring wheat. The corn is as good as any in he neighborhood and better than the majority. Under the old condition nothing could have been raised on his piece, as it is a black ash swamp ying very level and very wet.

"The owner says that he can get on to it to cultivate now the next day after a heavy rain, while before draining it would be a bog for a week. There are fifty acres of this swamp to drain yet and about twenty-five of it will be put in this fall. The old run that wound through this land has been deepened and straightened which has been of great benefit. The owner is so well pleased that he is going to continue until the entire swamp is drained, there being close to one hundred acres all told."

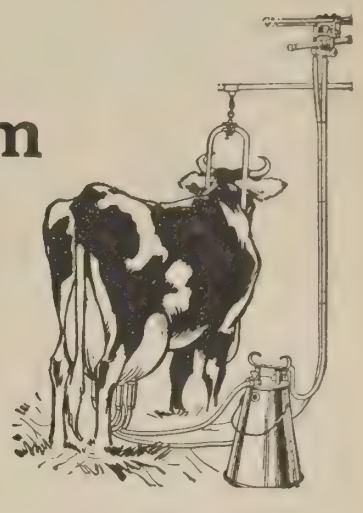
The Canebrake Cow Testing Association

HOARD'S DAIRYMAN:—There are comparatively few cow test associations in the Southeast, but it is doubtful if there is a more wide awake and hustling association in the country than that known as the Canebrake Cow Testing Association at Demopolis, Alabama. Recently the first annual picnic and meeting of this association was held on the magnificent and beautiful farm of Dr. S. E. Sparling, who is president of the association and a leader in his community. There are something like 3,000 cows being milked in the vicinity of Demopolis, and 600 of these are being tested through this association.

The crowd gathered about 10:30 A. M. and spent the first hour and a half in general conversation. At noon, an excellent picnic dinner was served on the lawn surrounding the home of Dr. Sparling. When this was finished the formal part of the program began. Mr. J. P. Quinerly of the Alabama Extension Service, Mr. W. H. McClain of the U. S. Department of Agriculture, Mr. J. M. Burgess, Director of the Canebrake Experiment Station, and others made talks along the line of the value of the cow test association in making the dairy business more profitable.

Several members of the association made informal talks telling just what the testing work had meant to them. One of the members brought out the point that testing had shown him that he was feeding, during the summer time, about two to four times as much cottonseed meal as was necessary. With excellent pasture and an abundance of alfalfa hay, this man stated that his cows gave just as much milk when they were fed 1 pound of cottonseed meal as they did when fed 5 pounds. Had it not been for the cow test association he said he would probably still be feeding the 5 pounds of meal per day per cow during the summer when pasture and alfalfa were abundant. This was but one of the many points brought out by the members of the association to show in a concrete and definite way just what the association has meant to them.

The work of the association has been so valuable to the members that another association is being planned and will, in all probability, be ready for work by January 1.



This limestone section in the vicinity of Demopolis is one of the best grass and dairying sections in the whole country. It does not look like the cotton belt, and one going through it might very well imagine himself in Ohio or some other grass and live stock section; and really this

RHODE ISLAND HOLSTEIN CALVES OWNED BY D. S. VAUGHN

The bull in the foreground was dropped April 15 and has been ed a maximum of 10 quarts of milk per day and a quart of alf meal. Since the first of August, the milk has been cut own to 5 quarts per day and all the corn fodder is given that ill be eaten. He had made so satisfactory a growth that neigh-ors pronounce him the largest calf of his age which they have ver seen.

Solve Your Milking Problem

—And Save Hundreds of Dollars

The answer is: Install a Sharples Milker. It takes the place of a hired man in a 20 to 25 cow dairy for at least six months of the year. So much for the labor end.

As to the saving: At the lowest, your hired man would cost $50 a month, including board. In six months with a Sharples Milker your saving would be $300. It doesn't take long to pay for a Sharples Milker—many dairymen do it in four to six months.

SHARPLES MILKER

THE ONLY MILKER WITH POSITIVE SQUEEZE

Another reason for Sharples superiority over hand milking and other milking machines is the positive *upward squeeze* of the Sharples teat cup—an exclusive Sharples feature which carefully massages the teats after each suck and keeps them in a perfectly healthy condition.

No other milker can or does squeeze or massage the cow's teats. Any pressure test proves this. This squeeze or massage makes Sharples the world's fastest milker, and increases the milk flow,—fast milking always does. Even a 12-year-old boy can operate a Sharples Milker successfully. Write today to nearest office for catalog, addressing Dept. 10.

Sharples Suction-feed Separators—Skim Clean at any Speed

Branches: Chicago San Francisco Toronto

COOL IT QUICK

With a C-P Dairy Conical Cooler

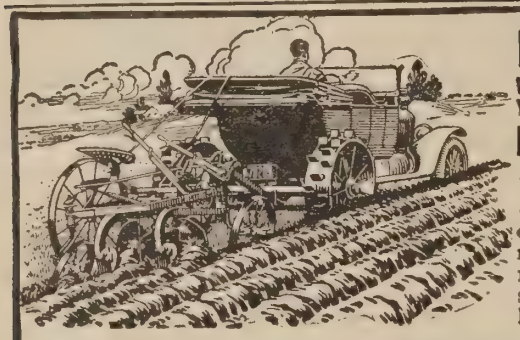
As soon as it comes from the cow or the separator is the time to cool your milk. Immediate cooling makes the milk stay sweet longer.

You can do this without extra trouble by using the

Dairy Conical Cooler

This rapid cooler reduces the temperature of the milk in ONE MINUTE to nearly the temperature of the cooling medium. Not only cools the milk but completely aerates it, removing all feed and stable odors.

THIS IS HOW IT WORKS: The C-P Conical Cooler is made of tin or copper in the shape illustrated above. The inside of the drum is filled with ice water or cold running water (a hose can be attached). The milk to be cooled is poured in the bowl and trickles slowly from this over the sides of the drum in a thin sheet. The thin sheet of milk flowing over the cold drum surface is cooled very quickly. The top is removable so that ice may be put directly into the cooling drum.



The Dairy Conical Cooler is automatic in the way it works; is simple in construction and can be as easily cleaned as a common milk pail. Costs so little and works so well that you cannot afford to be without it.

Tin coolers made of the best quality tin with galvanized bottom. Copper coolers are made entirely of copper.

Made in three sizes—the smallest size with a capacity to handle the milk from ten to twenty-five cows—and the work of three milkmen COST ONLY $7.00 in tin. Shipping weight 25 lbs. Prices of copper cooler and larger sizes on application.

Get your order in before we have to advance these prices. Our Dairyman's Catalog on request.

GUERNSEY BREEDER'S JOURNAL
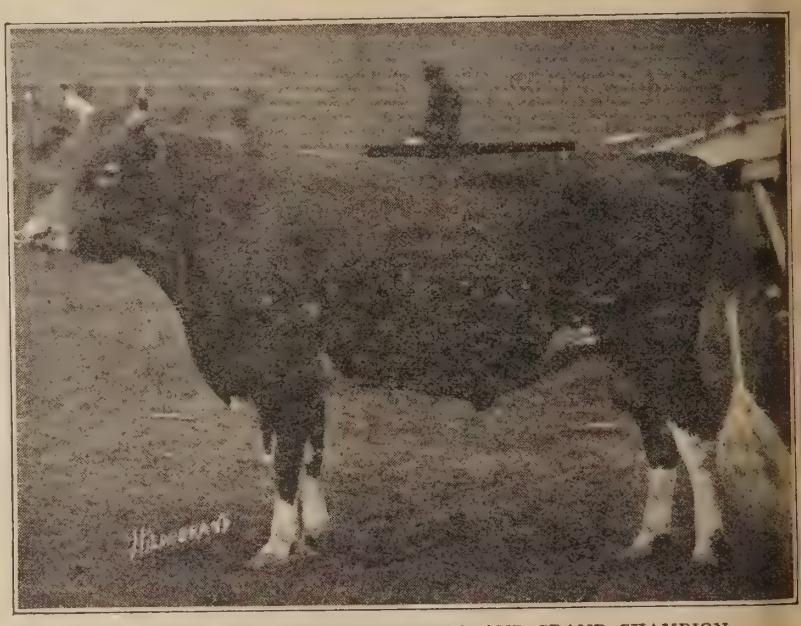
Peterboro, New Hampshire.

section has many advantages over the North and East on account of its mild and short winters. There are very few days during the winter when a fairly good amount of grazing cannot be had on the pastures. The whole section grows large quantities of alfalfa and Johnson grass hay. It would be hard to find a more prosperous and happy people than these who belong to the Canebrake Cow Test Association, and they are not only making a good living but making money.

It is the plan of the members of this association to make this picnic and meeting an annual affair, and it is expected that before many years have passed the attendance will be 500 to 1,000 instead of 50.

Alabama. L. A. NIVEN.

Special Need of Liberal Feeding



HOARD'S DAIRYMAN:—On trips through dairy regions, it is noticeable that many of the herds of dairy cows are especially thin for this time of year. This undoubtedly is a consequence of a drought during the latter part of the summer which caused brown and bare pastures. If cows go into the winter in this thin condition, they are apt to remain so, for it is difficult to put the good milkers in flesh again, and there will be a consequent reduction in the milk flow which causes a decided loss. Where cows weighing 1,000 lbs. produce an average of 18 lbs. milk per day, or 5,600 lbs. per year—above the average for cows in Illinois—three-fifths of the feed consumed must be utilized simply to maintain the body, and only two-fifths remain for milk production after the body is maintained. Since a cow must first utilize a maintenance ration, a reduction in the feed must, in the end, come from that which goes to produce milk. This shows that if cows are to be kept at a profit they must be fed a liberal ration, and emphasizes the fact that this is the time above all others to discard the unprofitable cows, especially in herds that are underfed. Then the maintenance ration of these unprofitable cows will be released for the profitable producers, which will allow them to be fed a more liberal ration and by so doing still further increase their economical production.

Where cows are thin in flesh, begin feeding a liberal amount of silage and legume hay at once, because this extra feed will not only bring good immediate returns, but increase the flow of milk throughout the late fall, winter, and spring. If cows go into the winter in good condition, they will make much more economical use o the high-priced feeds they consume.

This liberal feeding does not mea that cows must be fed heavily on cos ly grains. On the contrary, this is ex actly what this article is attemptin to guard against. Corn silage and l gume hay are much cheaper tha grains for the food value containe but as a cow cannot consume suffi cient silage and hay to more tha maintain her body and produce 2 lbs. of milk per day, it is of great im portance that she be fed to the lim of her capacity on these feeds befo winter sets in if she is in thin cond tion.

Because feed and dairy produc are so high, it is necessary to get th largest returns possible in order make dairy farming pay. It is, there fore, important that cows be both f and housed well, to keep their pr duction at a maximum. Any negle in feed or care will reduce the mi flow and this reduces the profit to much greater extent than the shrin age in the milk flow. Under avera farm conditions, a cow must produ about 4,000 lbs. of 4 per cent milk simply pay expenses, leaving nothi for profit. For this reason, if a c of 6,000 lbs. production is allowed shrink to 5,000 lbs., the production reduced only one-sixth, while t profit is reduced one-half. This r the average dairyman many ti fails to see. Don't let slip what pr might be yours.

Manitoba Butter Productio

HOARD'S DAIRYMAN:—That M toba farmers are producing incr ing quantities of butter in spite the big inducements of high pr and an exceptional season for wh growing, is attested by the fact t up to date, the province has expo one hundred carloads in additio supplying the home market. In 1 not only was there no butter expo but fifty-five carloads were being ported from Ontario for home sumption. Similarly, new import is attaching to the industry in katchewan, where shipment was m last week of two carloads of bu for the Siberian expeditionary fo Each car contained over six t sand pounds of butter and the constituted the first shipment Canadian butter to Siberia.

Illinois. G. LEININGE

Not all dogs, but the owner worthless dogs which make sh raising an uncertain venture, are enemies of the sheep man.

Dairy Farm Inspection

HOARD'S DAIRYMAN:—There seems to be a much better system of inspection from New York City, and other cities also, in relation to the production of milk than used to be in evidence. Not but that there are cases of foolishness now where some rule is unnecessary or is unwisely enforced or where some inspector becomes over-officious. The better system and method of enforcement seems to be due largely to two lines of influence. One is the better organization of dairymen whereby they have been able to make themselves heard and show what is needed to produce good milk. The next is that the experiment stations and colleges of agriculture have shown that most of the old rules were simply difficulties thrown in the way and of no real importance in producing good milk. The principle now involved is quick cooling and clean utensils, together with sound cattle and pains taken with the work of the dairyman.

In my own locality there has been for some time no inspection of any importance. Just recently we have come under the city rules to a greater extent, but have heard little about inspection yet. The veterinarian of the concern handling the milk has been here and has made his report. There has been very little criticism of the cows, and in most cases none at all. This inspection costs twenty cents a year for each cow, and if intelligently done is a benefit to the dairyman. It is a satisfaction to have what we believe to be an expert veterinarian look over the herd closely, listen to the breathing and circulation of each cow, using proper instruments for the purpose, and go away with no criticism to make on any animal. It encourages one that the stock is free from disease and is doing well. If a man has twenty cows the veterinarian's fees come to four dollars a year. The inspection is made twice a year and is at the demand of the health department of the city.

The city health board now requires the dealers to do some things that were omitted earlier. Take, for example, the receiving of milk under sixty degrees. In certain cases they require this of the dealer and if he takes milk that is above that temperature he takes risks. I was told a little time ago of two creameries that had been refused the privilege of shipping milk to New York because they accepted milk from three dairies above the specified temperature. The dealer explained the circumstances as one where the farmer did not succeed in getting sufficient ice to properly cool the milk and when it came in sound and sweet they accepted it rather than place these men at too great an inconvenience. They had been warned, it is true, but they took the chance and had the plant embargoed for thirty days in consequence. The inspector might have told a different story, but I believe that this is substantially true.

Bacterial counts are taken of dealers' milk in the city, and sometimes of the farmer's milk when delivered at the plant. It is on this count that the inspector decides frequently if the milk may be accepted. So far as I am informed there is no difference made respecting the kinds of bacteria present. High counts are supposed to mean large numbers of acid formers, and these must mean that the milk is practically free from danger except that it sours quickly. It would seem that here is a place where improvement might be made.

Another item that is worth while is the fact that where milk is pasteurized at the country plant, less attention is given to the temperature than in cases where it is sent to the city and then pasteurized. I know of cases where milk goes all right at a somewhat higher temperature than sixty but it is pasteurized almost as soon as received. I do not know why this is not all right, and I know of no reason why it may not as well be pasteurized in the country as the city.

New York. H. H. LYON.

An abundant harvest—a thankful heart—and safe reserves.

KULSHAN HAYES MAY ROSE, OWNED BY H. W. BATEMAN, WASHINGTON

THE two-year-old Guernsey heifer, Kulshan Hayes May Rose 73318, owned by H. W. Bateman, Washington, has recently completed an Advanced Register record of 8,244.7 lbs. milk and 499.47 lbs. butterfat, the average test being 6.06% fat. This heifer carried a calf 265 days while making the record, thereby qualifying for the Roll of Honor, and now takes fourth place among the leaders in Class GG, the junior two-year-old class.

Kulshan Hayes May Rose freshened eight days before reaching the age of two years, and her Advanced Register test began on her second birthday, May 10, 1917. During the year while on this test, and while carrying her calf 203 days the official figures were 543.13 lbs. butterfat, and 9,319.1 lbs. milk, but this record was sacrificed to qualify in the Roll of Honor requiring a cow to be in calf 265 days.

This heifer was bred by Fruit Bros., Wisconsin, and is a line bred "May Rose", being a daughter of Langwater Hayes Rosie's King of the May 16723, thus a paternal granddaughter of Imp. King of the May 9001. Her maternal grandsire is May King's Vrangue of Ingleside 15430, a grandson of Imp. King of the May 9001. This gives her four crosses to May Rose 2nd R. G. A. S. 3251 P. S.

When Writing to Advertisers, Mention Hoard's Dairyman

Langlade (Wis.) Free Fair

Langlade County's (Wis.) third free fair held in September was a decided success. Ideal weather conditions prevailing throughout the week assured a big attendance. Exhibits in all departments were numerous and of good quality with competition for prizes keen.

Pure-bred live stock exhibitors with stock to offer made a number of sales, always an encouragement to the man who goes to the trouble to fit his stock for the fair. The numerous contests which have come to be looked upon as a feature of the fair drew out a goodly number of competitors. These included a boys' stock judging contest with fourteen boys competing, a boys' calf raising contest with twelve exhibitors, a milk and butterfat production contest with twelve entries, also boys' and girls' potato, tomato, and pedigree pea growing contests with better than two hundred boys and girls enrolled.

The Grange booths proved one of the big hits of the fair. All told six granges had exhibits. Not only were they very complete as to number of exhibits, but taste shown in fixing up the booths was worthy special commendation. Langlade County boasts twelve active granges. Most of them have halls of their own and are an important factor in the social life of the respective communities.

The display of butter, cheese, and other dairy products was good. By far the largest part of summer's milk production is made into cheese, the county boasting twenty-one thriving cheese factories, the majority of them built within the past five years. Six creameries handle the bulk of the cream. Practically every farmer in the county owns a separator, used when milk is not delivered to the cheese factory.

In the past the machinery exhibit at Langlade County Fairs has been conspicuous by its absence, but not so this year. Dealers and manufacturers were out in numbers and always had an interested crowd about their exhibits. The tractor men, the gas engine men, and the dealers in potato machines were especially popular. The tractor men gave plowing and other demonstrations, apparently making a hit, as a number of sales were reported. "I never got really enthusiastic over a tractor till today," declared one of the county's most substantial farmers at the fair. Potato digging machinery was never in such demand as this year. One dealer reported the sale of fifty machines at and just preceding the fair.

Langlade County's progress in better live stock is distinctly reflected in its fair exhibits. Though this year's exhibit was way below what it would have been but for rush of work and scarcity of help on the farms, it was far superior in quality to the exhibits of a few years ago. Within the past five years the number of pure-bred sires in Langlade County has more than doubled. A number of farmers have also made a start at pure-bred herds during the same period. What is more they have been buying better quality stock. At the present time there are one hundred sixty-five pure-bred sires and better than that number of pure-bred females owned in the county.

Reclaiming Farm Lands for Soldiers

(Continued from page 356)

come face to face with the fact that a new policy will have to meet the new conditions. The era of free or cheap land in the United States has passed. We must meet the new conditions of developing lands in advance—security must, to a degree, displace speculation.

There are certain tendencies which must be faced frankly in our consideration of a policy for land to the home-coming soldier. First, the drift to farm tenancy. The experience of the world shows without question that the happiest people, the best farms, and the soundest political conditions are found where the farmer owns the home and the farm lands. The growth of tenancy in America shows an increase of 32 per cent for the twenty years between 1890 and 1910.

Second, the drift to urban life. In 1880, of the total population of the United States, 29.5 per cent of our people resided in cities and 70.5 per cent in the country. At the census of 1910, 46.3 per cent resided in cities and 53.7 per cent remained in the country.

It is evident that since the war in Europe there has been a decided increase in the trend toward the city because of industrial conditions. The adoption by the United States of new policies in its land development plans for returning veterans will also contribute to the amelioration of these two dangers of American life.

The Practical Solution

A plan of land development whereby land is developed in large areas, sub-

divided into individual farms, then sold to actual bona fide farmers on a long time payment basis, has been in force not only in the United States under the reclamation act but also in many other countries for several years. It has proved a complete success. In Denmark, Ireland, New Zealand, and the Australian commonwealth it has completely changed the land situation. One of the features of this plan is that holders are aided in improving and cultivating the farm. In a word, there is organized community development.

Its beneficial results have been well described by the Canadian Commission which was appointed to investigate its results in New Zealand. There, the commission reported, the farmers had built better houses or remodeled their old ones, brought a large acreage of land under cultivation that would otherwise have remained lying idle; had bought and urged more labor saving machinery on the farmers and in the houses. They kept more sheep and pigs and had so largely increased the revenue from their farms that they were able to meet the payments on the mortgages and to adopt a higher standard of living and a better one. Throughout the country a higher and better civilization was being evolved; the young men and women who were growing up were happy and contented to remain at home on the farm and found ample time and opportunity for recreation and entertainment of a kind more wholesome and elevating than can be obtained in the cities.

Development, Not Charity

It may be said that this country, outside of Alaska, has no frontier today. Of course, Alaska will still offer opportunity for pioneer life. And, of course, Alaska likewise has yet unknown remarkable agricultural possibilities, but unless we make possible the development of this land by the men who desire a life in that field, we will lose a great national opportunity. Furthermore, this is an immediate duty. It will be too late for these things when the war is over, and the work of definite planning should be done now.

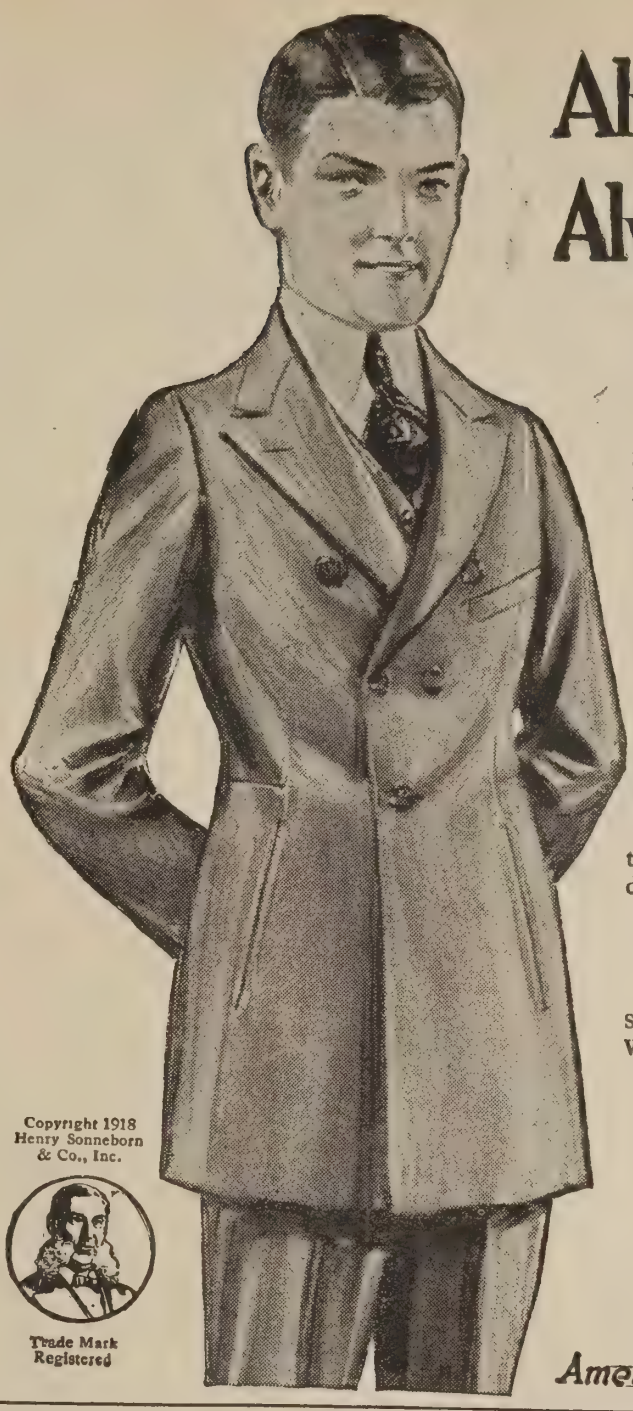
The plan outlined by Secretary Lane does not contemplate anything like charity to the soldier. He is not to be given a bounty. He is not to be made to feel that he is a dependent. On the contrary, he is to continue, in a sense, in the service of the government. Instead of destroying our enemies he is to develop our resources.

The work that is to be done, other than the planning, should be done by the soldier himself. The dam or irrigation project should be built by him; the canals, ditches, the breaking of the land, and the building of the houses should, under proper direction, be his occupation. He should be allowed to make his own home, cared for while he is doing it, and given an interest in the land, for which he can pay through a long period of years, perhaps thirty or forty years.

The farms should not be turned over as the prairies were—unbroken, unfenced, without accommodations for men or animals. There should be prepared homes, all of which can be constructed by the men themselves and paid for by them under a system of simple devising by which modern methods of finance will be applied to their needs.

Federal Accredited Herds

Every dairy herd in the United States that on July 1 had been officially accredited as free from tuberculosis, or that had passed successfully one test with a view to certification, is listed in a publication just issued by the Bureau of Animal Industry, United States Department of Agriculture, Washington, D. C. Copies of the list are available for the use of state and municipal officials and private persons.



Certificates of freedom from tuberculosis are soon to be issued by the Bureau of Animal Industry to all the owners of the accredited herds. Certificate No. 1 is to go to the United States Soldiers' Home in the District of Columbia. The Holstein-Friesian dairy herd at this institution includes 134 registered pure-bred cows and is one of the oldest accredited herds in the United States.

Control with a view to the eventual eradication of tuberculosis in cattle is being accomplished by systematic efforts of federal and state authorities in co-operation with cattle breeders' associations and herd owners.

A definite plan was adopted in 1917 whereby herds of cattle passing the prescribed number of official tuberculin tests should be certified or accredited as free from tuberculosis.

An accredited herd is one that has successfully passed two annual or three semi-annual tuberculin tests applied by regularly employed veterinary inspectors of the Bureau of Animal Industry or of the state where cooperative work is conducted, and has otherwise complied with the regulations governing the work.

The work is thought to have been in progress long enough to justify publication of the results. If the status of any of the accredited herds should be changed, prompt notice is to be given to the officials of the various states. Additional lists are to be published from time to time.—U. S. Dept. of Agriculture.

Always good clothes Always moderate price

Styleplus are made on a plan that insures good quality at a moderate price.

By making a few standard grades and making a big volume in each grade we cut manufacturing costs and produce exceptional style and exceptional quality at the price.

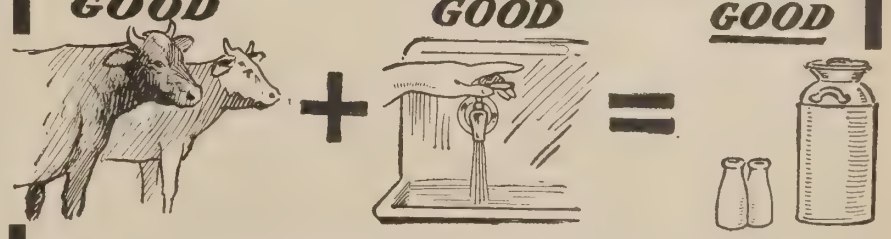
Back up Uncle Sam with your dollars as well as your patriotism. Spend wisely. Buy only the clothes you need and be sure that you are getting good honest value at a fair price.

Styleplus Clothes are moderately priced, carefully made of good materials, stylish in appearance and built to give you faithful wear.

The best way to buy clothes is to go to a store, where you can see them and try them on. Then you know the clothes will fit you and please you when they are delivered.

Visit the Styleplus Store today!

Two grades in Styleplus suits: $25 and $30.



Three grades in Styleplus overcoats: $25, $30 and $35.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AG) for Styleplus booklet and name of local dealer.

Clean and Clear as Water

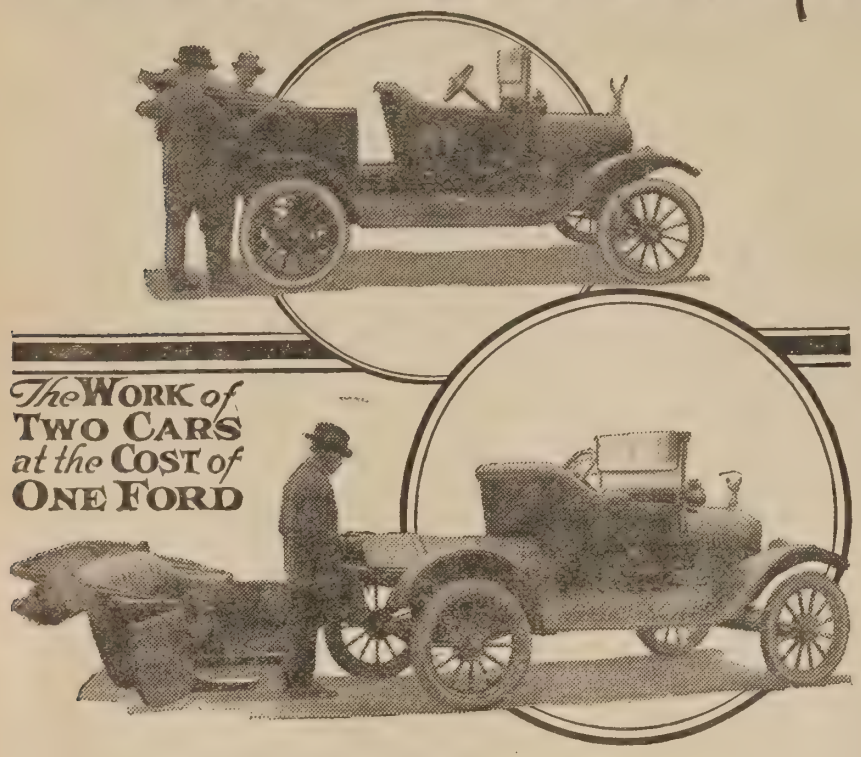
Awarded Gold Medal Pan.-Pac. Expo.

For Milking Machines

B-K keeps rubber tubes and teat cups sweet and clean. It penetrates milk solids and makes milker parts easier to clean—kills the bacteria that spoil the milk. B-K leaves no taint or taste of itself—makes rubber parts last longer—does not injure metal—is the cheapest in actual use. Sold under absolute guarantee.

Recommended by all Milking Machine Manufacturers

B-K has been used by thousands of milking machine owners including certified milk producers with complete satisfaction for over six years. It is the original purifier.



Get B-K today—end cleaning troubles and sour milk losses. If your dealer does not have B-K send us his name with your order. We have a dealer near you.

IMPORTANT to FORD OWNERS

The Ford Motor Company will make no more passenger cars during the war.

Your patriotic duty to get more use out of your Ford is, therefore, more emphatic than ever.

The Heath DUPLEX Folding Delivery Body makes the Ford do the work of both passenger car and truck. It changes the Ford from one to the other in 60 seconds.

The Heath DUPLEX attaches permanently to your old or new Ford touring car.

Once installed, it changes the Ford, without tools, in 60 seconds, into a strong and serviceable delivery car.

Another 60 seconds changes the Ford back into a passenger car.

Every farmer who can make a "two-in-one" use of his Ford—who now uses it for carrying goods as well as passengers, should see how the Heath DUPLEX does the work of two cars at the cost of one Ford.

The Ford dealer or some other dealer in your nearest town will show you how the Heath DUPLEX adds hundreds of pounds of capacity to your Ford at small expense.

He will show you how it does away with carrying goods in your Ford tonneau.

He will show you how, with the Heath DUPLEX, you no longer need a separate car for trucking.

He will show you how you can easily make a Heath DUPLEX pay for itself in a month's time.

One demonstration will convince you that you cannot afford to go another day without a Heath DUPLEX Folding Delivery Body.

Write for further information and nearest place where you can get a demonstration

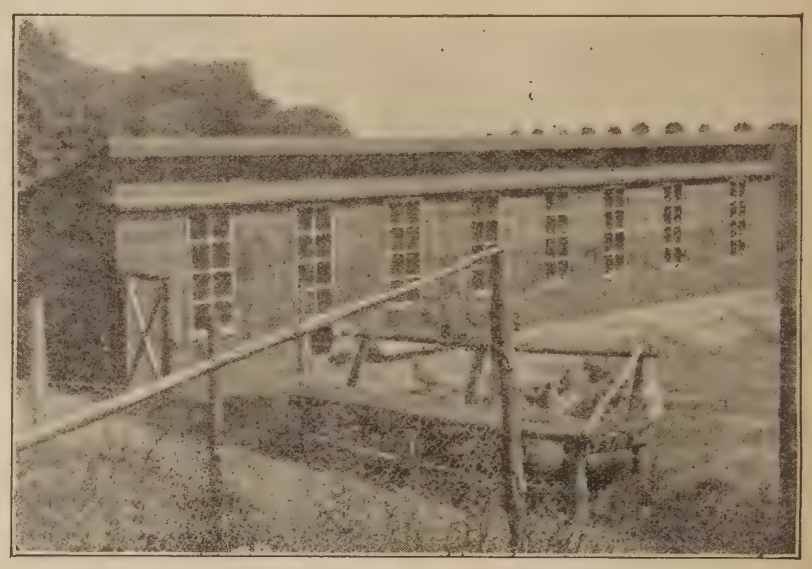
Raising Fall Pigs

HOARD'S DAIRYMAN:—As I have raised fall pigs for a number of years with very satisfactory results, my experience may be of interest to other readers of Hoard's Dairyman. The youngsters arrive about the middle of September and I let them run with their mother for about eight weeks, then they are weaned. At farrowing time I give the sow a bran mash with a little middlings as the first feed, being careful not to give too much. The feed is increased gradually until the sow is on full feed, which is about two weeks from the time she farrows. In case a sow becomes feverish soon after farrowing it may cause what is known as "white scours" in her pigs. This condition may be remedied by giving the sow a little air slacked lime in swill for two or three days.

The main ration of the brood sow ought to be such as will produce a good flow of milk but care must be taken not to get her "stuck" on her feed. My sows are given bran, middlings, ground oats, some corn, and the run of a woodlot and bluegrass pasture. I keep close watch of the pigs and if they become constipated I give the sow about a teacupful of oil meal in swill twice a day until the trouble is removed.



As soon as the pigs begin to crack corn I provide a creep for them in a place where they seem to spend the most time. Low flat troughs are placed in the creeps and shelled corn is put in them and also some scattered around them. I do not feed the pigs swill until they eat corn well. A sow ought to produce enough milk for them up to that time provided she is in good condition when she farrows and is well fed. I always have my sows somewhat fleshy at farrowing time.

I am in no hurry to give pigs liquid food. Too much drink and not enough solid food is not good for young pigs. When the youngsters are about eight weeks old I feed them all they want of a medium thick slop made of skimmilk and finely ground oats. This is poured in the trough and shelled corn put on top. The pigs eat the slop with a relish and are not troubled with scours as pigs may be when they are fed skimmilk or sour milk earlier in life. When feeding slop I place the troughs in the sunlight as it is a great disinfectant. The sunshine also keeps the troughs dry and sweet. The slop is mixed as it is fed and the corn fed dry. The older the pigs the more I feed the sows while nursing them. I feed but twice a day as more than that is a loss of time and feed. I once tried giving three feeds a day for a year and found myself the loser, but the loss was a lesson and so I charged it up to experience. I never feed any more than the pigs will eat up clean nor do I let them go away with a half fill as that is poor economy.

I never make a radical increase in the feed but let it be gradual just as the pig increases in size and capacity. I do not let the pigs stop thriving, for the sooner those to be slaughtered are brought to the weight desired the greater the profit. The pigs having the run of a good woodlot and blue grass pasture are able to get all the roots and herbs that they may care for, which help to maintain them in a good, healthy condition. A plentiful supply of good water is within their reach at all times, the water being afforded by a big spring. Keeping the pigs and older hogs free from lice and vermin and their skin and hair in a healthy condition is an important feature. The best thing I have ever used for this purpose is common lubricating oil, the kind that is used in oiling machinery. The oil is applied by means of a hog oiler which is so constructed that the pigs as well as the older hogs can use it successfully by simply rubbing against it. Only a small quantity of oil is required to oil a number of pigs or old hogs in this way and the results are very satisfactory. Crude oil is cheaper than lubricating oil, but the latter is safe to use while the former is not. Experience has proved to me that crude oil cracks and burns the skin in warm weather and makes the hog sick in cold weather, sometimes causing death. It is said this is due to the gasoline the crude oil contains.

I have good, comfortable houses for my pigs and their mothers in which they go when the weather is too severe for them to be out. A plentiful supply of good bedding is provided and is not allowed to become damp. Fall born pigs that have to sleep in damp beds contract colds and coughs. This will stunt them and it will require many days of careful attention to get them back in condition.

National Dairy Union Finances

Balance on hand Aug. 1, 1918	$4,659.07
Total receipts	19.73
	$4,678.80
Total Disbursements	354.63
Balance on hand Sept. 1, 1918	$4,324.17

This is to certify, I have today audited the books for S. B. Shilling, Treasurer of the National Dairy Union, and find the receipts from August 1, 1918, to August 31, 1918, to be $19.73, and the amount paid out for which he holds vouchers, the sum of $354.63, leaving a balance on hand Sept. 1, 1918, of $4,324.17.

F. P. COLLYER, Auditor.

Canadian Milk Situation

HOARD'S DAIRYMAN:—The situation in Eastern Canada in regard to city milk prices begins to look interesting. At their annual meeting held early in September, the Toronto Milk and Cream Producers' Association, one of the most powerful organizations of its kind in Canada, decided that the winter price would have to be considerably in advance of the price paid during the summer months. Accordingly a resolution was approved advancing the price from $2.50 per eight-gallon can (Imperial measure) to $2.80, or the equivalent of $3.12½ a cwt. delivered at the dairies. The price of sweet cream was raised from 66 cents per pound butterfat to 75 cents, the dealer to supply cans and brackets and pay the express.

This recommendation as to price was not passed unanimously. Some of those present were of the opinion that the price set was too low and that $3 per can would be low enough considering the high cost of feed, which it was stated was four dollars per ton more than it was six months ago. Another member pointed out that there was a danger in fixing the price for six months ahead, which is the usual custom, as no one could foresee what the price of feed would be two months hence. The meeting saw the wisdom of this suggestion and decided to recommend the price of $2.80 per can for only three months and to hold another meeting on January 1, should future conditions make it necessary. In setting the higher price, which will mean an advance of one cent per quart to the consumer, the producers were well aware that there might be a popular outcry and they expressed not only a willingness, but a desire to have the Food Board or the government conduct a thorough investigation into the cost of production.

The action of the Producers' Association had hardly been announced before the Toronto Milk Dealers' Association issued a declaration that they would not pay the prices fixed and maintained that they were able to get all the milk they required through the winter months at the summer price of $2.50 per eight-gallon can delivered at the dairy. It would seem that the dealers have a strong case. One of the largest dairy companies in Canada, the Canadian Milk Products Limited, paid in September $2.26 per 100 lbs. for 3.5 milk, with an advance or deduction of three cents for each one-tenth of one per cent increase or decrease in the test. The Borden condenseries are paying $2.30 for 3.5 milk, with the same increases and deductions. The Carnation Milk Company are paying $2.27½ for 3.5 milk, with increases and decreases of 6½ cents for each point of change in the test. The Peterboro Milk Products Limited is paying $2.10 per hundred pounds, without fat requirements. All of these companies have condenseries or milk receiving stations within milk shipping distance of Toronto. Considering the prices paid by condensing and milk powder companies, the dealers immediately began to canvass these outside districts and they must have met with some success as the Toronto Milk Producers' executive now announces a change of policy.

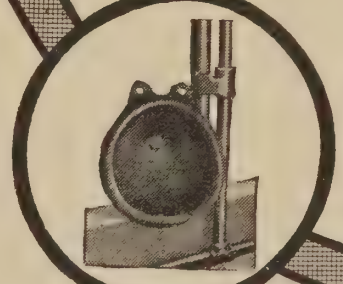
At a meeting held just a few days ago the executives of the Milk Producers' Association decided to continue the summer price of $2.50 per eight-gallon can until December 1, on account of the more favorable condition of pasturage and the abundance of milk at the present time". They further announced that their association has no intention of increasing the price of milk unless conditions fully warrant it and even then the advanced rate will not go into effect until there has been a thorough investigation into the cost of production. This decision was arrived at after they, too, had made a thorough canvass of all the dairy fields within reach of Toronto. Just what action will be possible on December 1, or what policy may be followed between now and then, is a question on which we are still in the dark.

In the meantime the Montreal Milk Producers' Association had held their fall meeting and had decided to recommend to producers that for the months of October, November, and December, the price of milk be 35 cents per gallon, or $3.50 per hundred pounds, delivered to the distributors and that the price of cream be seven cents per point butterfat. It was the unanimous opinion that the condition of the feed and labor market was such that the prices of the above articles of food should be fixed only until January 1. In the Montreal district this constitutes an advance of 40 cents per eight-gallon can over the price recommended by the association one year ago. Whether the dealers will pay this price or not, they have not as yet announced.

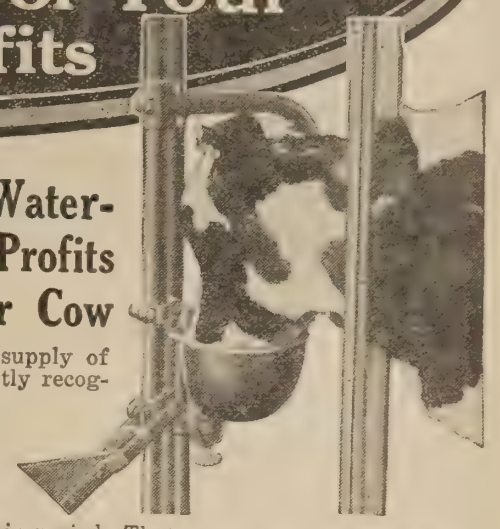
Ontario, Canada. F. E. ELLIS.

Cow Thirst—
Stealthy Thief of Your Dairy Profits

A JAMES Drinking Cup in place on the stall—the first and only removable gravity cup on the market



Ready to take cup from stall post for cleaning



Lifting the cup from stall post before pouring out stale water for cleaning

Smooth, Easy to Clean

The Trough Method of Watering is Robbing You of Profits of $4.00 to $8.00 Per Cow

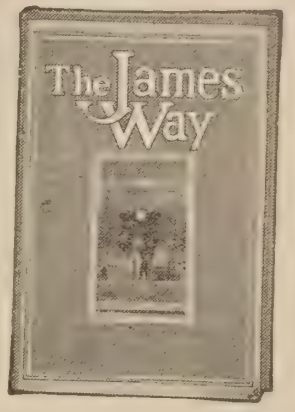
The milk-making *value* of a *constant* supply of fresh water to the cows is not sufficiently recognized.

No cow will drink as much as she needs from an icy trough—and what she does drink is too cold. All your cows are *handicapped by thirst* during most of the day and night—if you depend on trough watering during housed-in-period. That means that they are robbed of the water they *must* have to digest their food—to make milk. Too little water means too little milk. Water must be where the cow can get it—every hour of the 24. Otherwise, a part of the milk-making power of her food is wasted. That waste spells a distinct *loss* of one to two pounds of milk per cow per day.

Rich Milk is 87% water. Just plain water is the cheapest dairy ration—*and one of the most important.* You will *gain* from one to two pounds of milk per cow per day—a total gain of from 200 to 400 pounds of milk *more* per cow during the barn-feeding months, by installing James Drinking Cups in your dairy barn.

JAMES Drinking Cups

Either Gravity or Pressure System



MAKE MONEY OUT OF WATER

This gain in yield spells a *sure* profit of from $4.00 to $8.00 per cow. It means that the James Drinking Cups will *more than pay for themselves the first season.*

In fact, John Hetts, one of Wisconsin's best known breeders, declares:—"With one cow of my herd, the James Drinking Cup paid for itself *inside of 10 days in increase of milk yield.*"

The James Drinking Cup installation is built on the gravity system. Also if desired equipped for pressure system. Note the photos to left and see how easy these cups are lifted from their positions, for thorough cleansing. The cups are located between the stanchion and stall post—see cut at top—the handiest place for the cow. This makes it harder for her to toss feed into the cup—water is kept clean longer. The water flow is regulated by special extra-sensitive valve designed by us. Works perfectly *no matter what the water pressure is.* Prevents water passing from one cup to another—prevents any overflow and flooding of barn. Operates absolutely automatically.

The ingenious James Regulating Tank keeps the water *constantly* at the right level in drinking cups. Marvelously sensitive to slightest out-flow of water—quick as a flash in shutting off or feeding in water as needed.

SEND FOR A FREE COPY OF THE "JAMESWAY"

At least, investigate this way to *"Make Money Out of Water"*. Do so today. Send for booklet. Get a copy of that famous book, *"The Jamesway"*, the authoritative book on barn building and equipment. Even though you are not thinking of building or remodeling now get it anyway. Send the coupon today.

A Texas County Dairy Association

HOARD'S DAIRYMAN:—The dairymen of Tarrant County, Texas, in which Fort Worth is situated, have organized the Tarrant County Dairymen's Association. The organization is to be known as the Tarrant County Dairymen's Association. W. V. McClure was elected president and Walter Brazelton, secretary. The association will co-operate with the Tarrant County Cow Testing Association in its work.

John W. Wray was instructed by the newly organized dairymen to contract for the organization for 500 tons of cottonseed meal, 500 tons of hulls, 100 tons of wheat bran, and other feeds.

Texas. W. D. HORNADAY.

Jersey Cattle Notes

For week ending Sept. 27, 1918:

Number of animals registered: Bulls, 180; cows, 464; total, 644. Number of transfers recorded: Bulls, 178; cows, 531; total, 709.

Unarmed Arms of the Service

Men from the battle front who have been holding the line for months and years complain of the monotony of war. The soldier's life in the trenches soon ceases to be a novelty and becomes a tedious routine.

The morale of the army is of supreme importance and the greatest military authorities of the world are enthusiastic in their praise of the organizations which make it their business to keep the soldier in good spirits.

This work, like that of the Signal Corps, has been more highly developed in this war than ever before. Huts for amusement, comfort and recuperation of the fighting men are in the trenches as well as behind the lines. The unarmed workers go about their duties under shell fire as coolly and as self-forgetfully as the telephone men of the Signal Corps who are frequently their neighbors, and who keep intact, often under a hail of bullets, the indispensable lines of communication.

It is for us who remain at home to support these unarmed heroes to the utmost, with our gifts, our labor, and our unbreakable morale.

Care of the Milking Machine.

(Continued from page 357)

The machine is first connected up with the vacuum pipe by means of a short pipe of rubber tubing, and the vacuum is turned on. The teat cups are inserted in a pail full of lukewarm water. The tubes are lifted up and down. This together with the vacuum rinses the teat cups and rubber tubing. If this is done at once after milking before the milk has a chance to dry on, then there will be very little milk to wash off by hand and brush. The gulching of the water thus brought about is quite effective.

However, this alone is not enough to keep the milking machine in good sanitary condition. The water in the double vat is then made ready. One compartment is filled with a clean, hot water, and the other compartment is filled with warm water containing some washing powder. The former is used for rinsing and the latter for washing. The temperature of the rinse water should be about 125°F., and that of the wash water about 100°F.

When the rinsing by vacuum is completed the machine is taken apart and put into the prepared wash water. With the brushes specially provided, the different parts are cleaned, and one by one they are dropped into the other compartment containing the rinse water.

Keep in Disinfectant

From there the parts are put into the disinfectant solution. There is a great deal of difference of opinion as to what kind of a disinfectant to use. At this experiment station practically all of the common ones have been used and they have been tried at the same time comparatively, and bacterial analysis and observations made.

None have been found better than ordinary hydrated lime solution. The lime may be purchased anywhere. It may be had in a convenient package. It costs very little. It is not a poison such as are some of the other common disinfectants. Lime may be kept in a dairy with perfect propriety and safety. Lime does not cause odors in the milk room, or in the barn that will endanger the flavor of the milk. Lime is an effective germ destroyer if used properly. Lime solution does not affect the rubber and metal parts of the machines. Lime has a cleansing effect that can not be had from some of the other substances. It is a deoderizer, as well as a germ destroyer.

The solution is made up to about two per cent strength. About two pounds of hydrated lime are used for each one hundred pounds of water and stirred.

The cleaned milking machine parts, teat cups, and rubber tubing are kept in this lime solution between usages. The pails are cleaned and handled exactly as are any of the other milk pails and cans.

The above method and disinfectant are not the only ways in which the machines can be kept in a good sanitary condition, but it is a good way. Anyone who already is using some other disinfectant and who is already having a handy and successful way of keeping the machine sanitary had probably better not change.

Undoubtedly some will say this is a lot of work to go through with twice a day, but if prepared for it the task is easy. It can be quickly done.

For the production of certified milk it is necessary to thus take the machine apart and clean thoroughly after each milking.

In order to keep the bacterial count down below 10,000 per c. c. it is also necessary to steam or scald the pails just previous to milking. Otherwise the bacterial count from the milk of the first few cows milked will r high.

For producing good commerci milk the cleaning in two sets of wa water with brushes is necessary on each morning, and not twice each d as described above for the producti of certified milk. I have found th in the evening the men are natura in a hurry. They want to finish t chores as soon as possible. On th account each morning is select rather than evening.

When this method of cleaning practiced it is doubly important th the milking machine be well rins each evening immediately after mi ing and before any of the milk ha chance to dry on. Two sets of ri water should be used. One to remo the excess of milk and then one p of clean water for final rinsing. refer now to the rinsing by attachi the machine to the vacuum pipe.

Keep Vacuum Pipes Sanitary

One would naturally think that pipes containing the vacuum wo not need any attention. But they When the machines were first stalled in the college dairy barn, t point was overlooked and the qua of milk became bad. The trouble finally located in the vacuum pipes

The frequency with which vacuum pipes need cleaning will pend on whether milk gets into system or not. If the pails are mil too full, then milk will be drawn o into the vacuum pipes. If this h pens every day the pipes should cleaned every day. They should cleaned as often as this mistake h pens.

Even though no milk is drawn i the vacuum pipes, they will bec unsanitary. Vapor or moisture drawn from the milk pail into vacuum system. The cold pipes condense the vapor.

Before starting the milking chine all pipes should be opened drained, so that none of this densed water with impurities d into the rubber tubing and even the pail. This is important.

It is also impossible to prevent from getting into the vacuum pi This together with the moisture rish raw material for foulness.

Method of Cleaning Vacuum P

Before the small steam boiler installed in a room adjacent to dairy barn, we cleaned the pipes pumping two sets of wash w through them. Some water warmed, and a little washing pow added and stirred until well dissol

The vacuum pump was then st ed, and the prepared warm wash ter was pumped through from the treme end of the vacuum pipe. water with any dust in the sys was drawn into the vacuum sto tank located in the power room. the bottom of the vacuum tank t is a drain where all of it was dra away.

When this set of wash water done its work well, then we pun through a pailful of boiling hot ter, and drained away from vacuum storage tank as before. power is shut off and all drain c opened. This leaves the vacuum tem clean.

The heat in the pipes absorbed the hot water will dry the whole side and leave it in a clean, dry dition.

Since the installation of the s steam boiler, steam alone has used. All drain cocks and place attachments are opened. A small connects the vacuum pipe and boiler. The steam is gradually tu on. At first the cold pipes cond the steam. When little more stea turned on, the water rinses ou dirt particles.

The steaming thoroughly dest

l living organism. It also heats the pes so they dry well after cleaning. his method of cleaning takes very ttle time. It is effective and does harm.

If any milk had been accidentally awn into the vacuum pipes, then ey should be rinsed out with kewarm water before the steam is rned in.

This cleaning we do regularly once ch two weeks whether there is a ed for it or not. It takes but a short ne, and it is better to do it once too ten than it is to run the danger of ving the milk infested with abnor-al and undesirable germs.

Queen Esther Fox

HOARD'S DAIRYMAN:—It was the io state championship record made Fox's Queen of Minerva in Octo-r, 1916, that made me go hunting r her family. The first move was to d her dam. Not knowing where e was or whether dead or alive, it as necessary to consult the Ameri-n Jersey Cattle Club office and then find her after the address of her ner was obtained. It was near inerva, Ohio, that she was found, ve and hearty at the age of thirteen d one-half years. It was midwin-r before I had finally bought and oved Queen Esther Fox to my farm. All the early summer of 1917 she

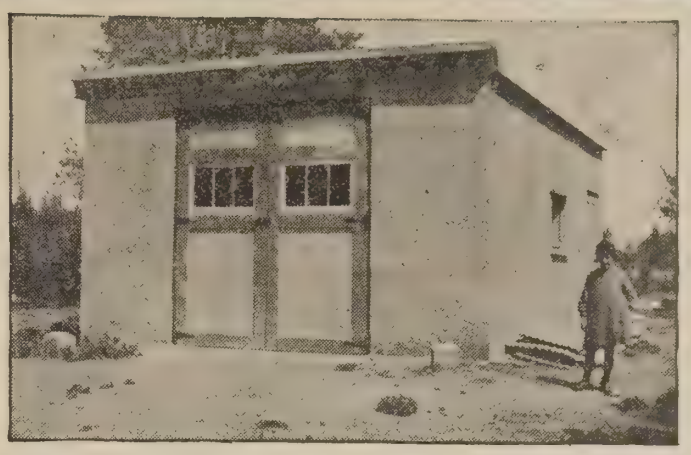
JERSEY COW, QUEEN ESTHER FOX
At 14 years of age she has a year's record of 10,371.2 lbs. milk containing 596.85 lbs. fat.
OWNED BY HUGH W. BONNELL, OHIO

nt to pasture, thus maintaining by ercise and feeding her remarkably oust health. She calved August 30, 17, with no trouble, giving us a fine ifer calf and started in to work e a seven-year-old. Her test began the age of 14 years, 25 days, on ptember 6, 1917, and when her year s over she had to her credit 10,371.2 . milk and 596.85 lbs. fat which ves her the world's championship a cow beginning test at 14 years over. The record we had to sur-ss was that of Pogis Irene 2nd, n of the former world's champion, coba Irene. The record of Pogis ne 2nd was made at seventeen ars and so is more remarkable than s but, nevertheless, we were de-hted to have our fourteen-year-old ish with 6 lbs. fat better than Pogis ne 2nd's record.

This performance gives my state mpion cow a world's record dam. ave three Register of Merit grand-ughters of Queen Esther Fox and ee Register of Merit great grand-ughters, and a fourth great grand-ughter, and two great great grand-ughters not yet in milk, besides a arling daughter. This gives me ven females from the old cow down, ided into five generations and kes us feel that there is no doubt out the production and reproduc-n of our family.

Queen Esther Fox is again safe in calf and will qualify for Class AA, having only 20 days from the finishing of her test to calving time.

Ohio. HUGH W. BONNELL.



Factors in Profitable Production of Sanitary Milk

Kentucky Bulletin 206 by W. D. Nicholls describes experiments carried on with a view to determining the number of bacteria to which milk is subjected during the various daily operations in the dairy barn and milk room and to determine the best means of preventing bacterial contamination. The results were obtained by exposing glass petri dishes containing a sterile nutriment medium in the dairy barn of the station and the adjoining milk room.

The results indicate that in a well-cleaned dairy barn very few bacteria are present in the air, but when dust is present the number is very large. "When the cows are in the barn the number of bacteria in the air is materially increased. The presence of bedding in the stable greatly increases the bacteria of the stable air. Dusty mill feeds and hay are fruitful sources of bacterial contamination. The act of brushing the cows adds myriads of bacteria to the surrounding atmosphere. Washing the cows' udders, even when apparently clean, greatly reduces the number of bacteria falling from the udder. Infection from washed udders is less than one-seventh of that from unwashed udders. The air in a pasture upon which is growing a heavy sod of grass is nearly sterile. In a dairy room having smooth walls and a concrete floor which are regularly and carefully washed the air should be practically free from bacteria."

It is suggested that "to keep down the bacterial contamination of the air in the stable where the cows are milked the room must be kept well cleaned and every effort must be made to keep down all the dust. Dusty bedding must be avoided, and if bedding is used dust should be laid by sprinkling. Since cow hairs are laden with bacteria, all loose hairs should be removed from the cows by currying, in order to prevent them from falling into the milk. However, sufficient time should elapse after currying to permit the dust and bacteria to settle to the floor before milking begins. The cows' udders should be carefully washed with tepid water and a clean cloth before milking begins. Wiping the udder with a clean, damp cloth greatly reduces bacterial contamination of the milk. In feeding mill feeds and hay care should be taken to raise as little dust as possible."

CONCRETE FOR PERMANENCE

Why not house your tractor?

Tractors cost money—to buy, keep in repair, and to buy again.

You can save a great deal of that money by keeping your tractor in a garage, where it is safe from weather, where you have tools and a work-bench handy to make small repairs and adjustments. A garage adds to the life of your tractor, adds to its second-hand value, gives you constant use of it, keeps your repair bills down to little or nothing—saves you time and money.

You can do it yourself

With farm-tools and ordinary farm-help, you can build a garage large enough for both tractor and motor-car, with place for work-bench and extra parts. Costs very little more than for either alone.

It ought to be near your barn and other farm buildings, so that you can use your tractor for belt-work: cutting feed and ensilage, shelling corn, sawing wood, baling hay, etc. Therefore it ought to be fire-proof, or at least fire-resisting.

That means concrete or stucco—which cost less than you think. They last a life-time and save their cost very quickly.

Dairymen Meet With Hoover

The rapid advance in the price of butter caused Mr. Herbert Hoover to call to Washington, on October 2d, a few representative dairymen from several states where dairying is an important industry. The purpose of this conference was to consider the feasibility of stabilizing the price of butter. The consuming public came to Mr. Hoover protesting against the high price of butter and this led him to consider seriously what might be done to regulate the price of butter.

In his remarks before the conference he in substance said: "It is my purpose to be just with both producer and consumer. Creamery butter is now from 25 to 50% higher than it was last year at this time and there is bound to be a collapse, sooner or later, in the butter market. Butter is a highly essential food, but many consumers will buy oleomargarine if butter prices go too high. I realize that the producer must have cost of production plus a profit if he is to continue in business, but it seems to me the prices of butter for 1917 must have been sufficient to yield the producer a profit, for our herds of dairy cows have increased. I have no power to fix the prices of butter, but a combined buyer can stabilize the market. Oleomargarine prices have been agreed to. Nut margarines will retail at 32 cents a pound and those made from animal fats at 35 cents. If the price of butter goes too high it will lead people to eat oleomargarine."

Mr. Hoover held that the prices of feeds were cheaper this year than last, but the dairymen did not agree with him. Some feeds are cheaper, but on the whole feed prices are higher. Further, the prices of butter last year were not in keeping with the prices of other farm products. According to Dean Russell, who has been serving in the Food Administration, "the price of staple products today shows dairy products to be relatively lower than in most other cases. The price of flour this summer is over 100 per cent more than before the war. Sugar has increased 53%; beef, 52%; pork, 99%; lard 167%; while butter has only increased 43% and cheese the same". This statement was made by Dean Russell on August 7th. Butter has increased in price about 33 per cent since August. In terms of purchasing power of staple articles the price of butter is none too high. In other words, the price of butter is about right when compared to the advance of prices of other staples. The producer of butter may reasonably expect his products to advance in price in the same proportion to other products.

It was considered feasible by Mr. Hoover and approved by those present that it is desirable to stabilize the price of butter; or, in other words, set a minimum price which the government will try to sustain.

A committee consisting of Professor Clyde L. King, Pennsylvania; Charles Brand, Ohio; I. Ingersoll, Ohio; Ex-Governor Warner of Michigan; G. R. Rice, Wisconsin; Frank Kingsley, Iowa; W. F. Schilling of Minnesota; and Robert Scoville, Connecticut, was appointed by the meeting and approved by Mr. Hoover to co-operate with the other advisory committees of the Administration and to further consider the situation and to advise with the Food Administration as to what action should be taken to stabilize the situation. The new committee adjourned to meet again at a later date, in the meantime to investigate and consider the many factors involved.

Rawl Appointed Assistant Chief

The Secretary of Agriculture announced today the appointment of Mr. B. H. Rawl as Assistant Chief of the Bureau of Animal Industry. The

B. H. RAWL

appointment became effective on October 1. Mr. Rawl has been Chief of the Dairy Division of the Bureau of Animal Industry since 1909, and, in addition to his new duties, he will continue to supervise the work of that division, the scope of which during the past nine years has increased six-fold and now reaches two-thirds of the states.

Mr. Rawl was graduated from the Clemson Agricultural College, South Carolina, in 1900. He later took a special course in dairy husbandry at the Pennsylvania State College and the University of Wisconsin, and served as assistant professor of animal husbandry and dairying at Clemson College from 1902 to 1905. He entered the service of the Bureau of Animal Industry as dairy husbandman in 1905 and, as indicated, was made chief of the division in 1909. He is a trustee of the Clemson Agricultural College and a member of the American Association for the Advancement of Science, of the South Carolina Agricultural Society, and of the South Carolina Live Stock Association.

Pledge of Honor for Mill Feeds

To distribute wheat mill feeds more uniformly and to check their lavish use in areas surrounding mills where this feedingstuff is very cheap, the Food Administration announces a pledge card system of control effective October 1, 1918. The plan finally chosen from among those considered gives American farmers a direct opportunity to co-operate in securing results which have an important bearing on our own agriculture and on the world food situation. The following explanation of the plan is addressed to farmers of the United States by Herbert Hoover, U. S. Food Administrator:

"Owing to the extension of the drought area, the shortening of the corn crop, the larger population in the country, and the allied demands upon us for feedingstuffs for their own animals because of their own shortage in produce of feed grain, it is necessary that we should exert every effort in the proper conservation of feedingstuffs during the next twelve months. It is necessary that we should ship a larger proportion of wheat as compared with flour during the next twelve months than during the last twelve months to the allied countries, because their own shortage of feedingstuffs is such that if they are to keep alive their dairy herds they must have a larger supply of wheat milled.

"Already, the milk supply in the allied countries has been limited practically to the supply of children and other vitally necessary national uses and any failure on our part to supply them with necessary feedstuffs for their dairy herds means that we shall cut into the actual safety of the children amongst the allies. On the other hand, both our own population and the allies are dependent upon our production of animal products and we do not in any way wish to stifle this production. What we must secure is the utmost conservation in feed, and the total elimination of waste by the careful feeding of animals and the use of all the roughage available.

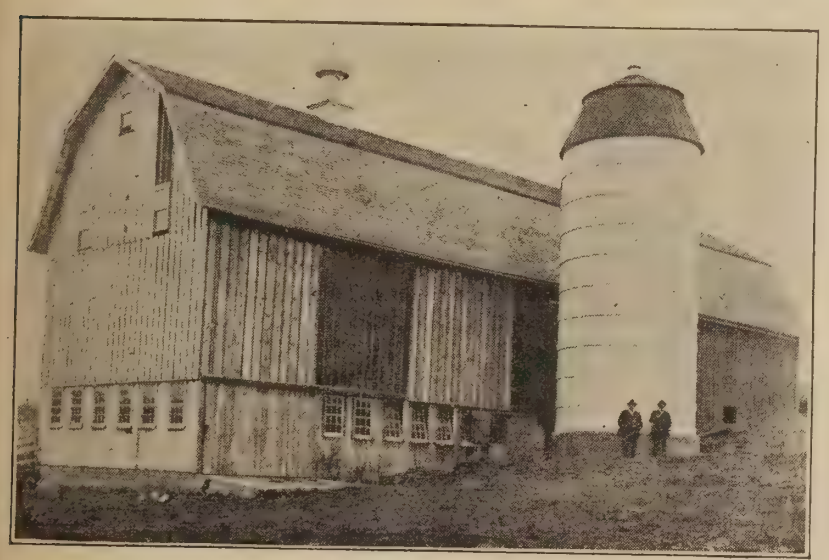
"One of the difficult problems is the distribution of wheat mill feeds, and this is made more difficult by the fact that the Food Administration, in an endeavor to protect the farmer, is maintaining an artificially low price on these feeds. One consequence is that a great deal of mill feeds are now going unnecessarily into work animals or beef production. Every farmer will recognize that the wheat mill feeds are vitally necessary for the dairy cattle, to some extent for the poultry, and for young pigs. Owing to the absorption of mill feeds at local points near the mill, considerable sections of the dairy industry are practically without mill feeds and our dairy production is thereby in danger.

"With view to correcting this, as far as possible, the Food Administration desires to appeal for the assistance of the farmers of the country in the use and distribution of wheat mill feeds, in addition to general conservation of feedingstuffs. In this view we are asking every buyer of wheat mill feeds, outside of the acute drought area, to sign a pledge of honor or not to use the wheat mill feeds for any purpose except the essential use in dairy, young pig, and poultry production, and not to purchase or hold at any one time more than 60 days supply. Unless we can assure the careful and specialized use of mill feeds, our dairy production in the congested eastern areas of the United States is bound to fall and to jeopardize the food supply of our people in that section. Otherwise it will be necessary to release the price restrictions on mill feeds and allow them to take their natural course.

"With a view to securing this co-operation from the farmers all over the country in the interests of the industry as a whole, we are instructing the mills and all dealers in feed to secure from the buyer of wheat mill feeds the following pledge:

"In order to assist the Food Administration in the distribution of wheat mill feeds, I hereby undertake on honor not to use wheat mill feeds for any other purpose than the feed

ing of dairy cattle, poultry, young pigs, or young calves, or the preparation of a weekly bran mash for work animals.



"I will not feed any more wheat mill feeds than is customarily fed to such animals, and I further agree not to have at any one time more than a 60-day supply of wheat feeds on hand."

The Distribution Ruling

As an additional means of control the Food Administration has issued a regulation directing distribution by states so that the former normal movement of wheat mill feeds may be maintained as nearly as possible. This ruling is national in its scope but with exceptions for certain states where drought has been acute. The text of the ruling follows:

RULE M. S. 32. (effective October 1, 1918) MILL FEED TO BE DISTRIBUTED AS IN 1917. The wheat miller shall distribute all mill feed manufactured by him equitably between the different states of the United States, in such manner that during each calendar quarter on and after October 1, 1918, the amount of wheat mill feed shipped into any state shall not be a less percentage of his total shipments of mill feeds during such quarters than was shipped into such state in the corresponding quarter of the year 1917. Where shipments made in 1917 were subsequently reconsigned to other points, the ultimate point of consignment shall be taken as the basis for the foregoing calculation, so far as the miller, from his records or best judgment, can judge as to the ultimate point of consignment. This rule shall not apply to mills located in the drought areas of Montana, Colorado, New Mexico, Nebraska, Kansas, Oklahoma, and Texas.

A similar rule has been issued applying to feed dealers. Farmers should realize that the price of wheat mill feeds is artificially low and the supply is insufficient to give everyone the quantity desired. Under the system of distribution outlined, however, the benefits of low-priced mill feeds will be shared by a greater number of farmers than heretofore and the feed will be used in a manner to strengthen America's position in the international food program.—U. S. FOOD ADMINISTRATION.

BARN AND SILO ON FARM OF ED. MEACHAM, WISCONSIN

New York Butter Market

New York City, October 1—The market seems to be at a sort of standstill at the present time. Indications are that with the increase in the wholesale price of butter the consumer has lessened his demand for it. While the market is as yet fairly strong it is not excited as it has been for the past few weeks. Some anticipate that within a short time prices will gradually retreat but not to any marked extent. There is a point above which the consumer, regardless of how prosperous he may be, will not go in buying butter. When the retail prices go to 65, 68, and 70c per pound, he hesitates before putting down the best part of a dollar for a single pound of butter. There are few of us who will criticize him for turning to cheaper substitutes when prices get almost prohibitive.

One week ago today extras (92 score) were quoted at 61c. Today the quotation is 62c. The advance was made on Monday of last week when the quotation 61½@62c was established. On Saturday the market showed additional strength and the inside quotation was eliminated. Since then the market has developed no additional strength. Additional quotations at the close today were as follows: Higher scoring than extras (93 score or above), 62¾@63c; firsts (88 to 91 score), 59@61½c; and seconds (83 to 87 score), 55@58½c. Unsalted butter is in good demand with quotations about one and a half cents above those for corresponding grades of salted butter.

Receipts of butter have been light all the week. The last two days have shown some slight indications of increased shipments. Storage stocks have been turned loose to some extent which has made the available supply of butter somewhat greater than for the past two or three weeks. Storage stocks, of course, are limited because of the commandeering of the greater part of it by the government and will have no permanent influence on the market although their influence may be felt temporarily at times. As a whole, the market bids fair to remain active but it seems that the upper level of prices has been reached. W. B. LIVERANCE.

Development in Foreign Agriculture

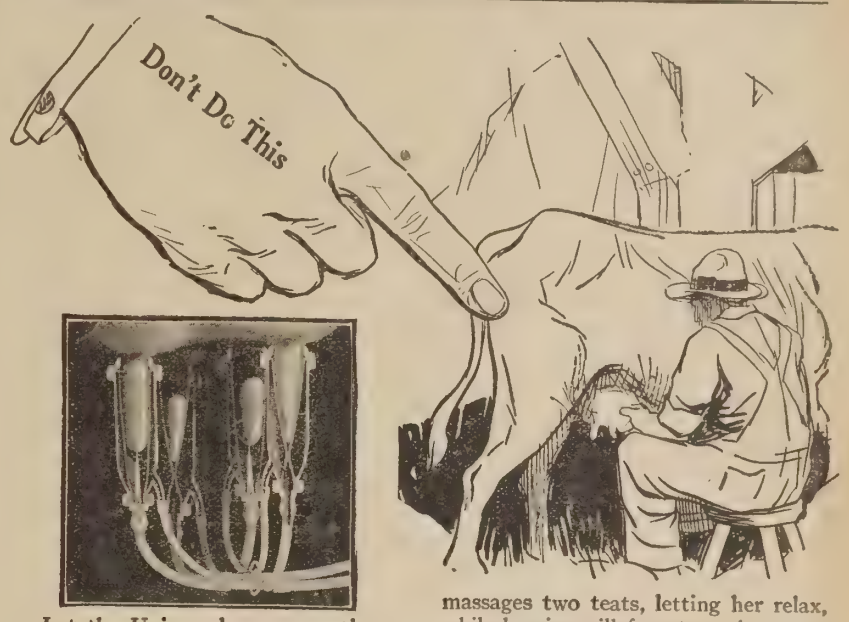
A recent Italian decree directs that sugar beets must be used only for sugar production and not for any other industrial purposes or for distillation. Italy is using every possible means to maintain her present sugar ration of 1 pound per person per month, which is only half the monthly allowance in the United States.

Brazil Creates Food Administration

To restrict the exportation of its food products and to control prices and distribution, the Brazilian government has authorized the creation of a food administration.

No Man's Land Soon to Grow Crops

The French government has already made arrangements for bringing back into cultivation the desolated and war-torn areas from which the enemy has been driven. The dense population of France makes prompt agricultural restoration necessary to relieve the food situation. Preference will be given to farmers who originally lived in the invaded regions.



French Hay and Straw Prices

Shortage of animal feeds in France, though frequently announced in the foreign crop reports, is perhaps most clearly reflected by the prices prevailing in the forage markets. There are three qualities of fodder. The prices quoted prevailed in midsummer and are for the second or medium quality. First quality fodder averages from $2 to $3 more per ton and third quality the same amount less: Wheat straw, $78.00 per ton; hay, $84.00; lucerene (alfalfa) $88.00. Shortages of transport make deliveries of all feeds uncertain and in some markets there is practically no business.

Norway Rations Skimmilk

A decline in production of milk and dairy products in Norway has resulted in rationing skimmilk since June 17. Children under five years old may have an amount equivalent in United States measure to about one and one-fifth pints. Persons over 15 years are limited to slightly more than one-third pint daily.—U. S. FOOD ADMINISTRATION.

Universal
natural milker
Alternates, Like Milking With Hands

Let the Universal save your time—get more milk—increase profits, and *benefit your cows.*

It pays for itself each year—you need only *one* Universal—it lasts a lifetime.

It is simple, dependable, always ready to work, asks for no holidays,—no bother, no adjustments to make.

The rubber-lined teat cup fits all cows—and its alternating action is like milking with hands.

The Universal *benefits* the cow—it massages two teats, letting her relax, while drawing milk from two other teats.

Write us for catalog—get the experience of other farmers with the Universal—profit by it.

"After having used two other machines—we find the Universal far ahead in simplicity of construction and ease in operating."

EDITORIAL COMMENT

GRINDING FEED

The dairy cow is a hard working animal and it pays to prepare her ration well if she is to do her best work. The feeding of whole grain is uneconomical; not only does it waste a large amount of it but the cow will not produce milk to her full capacity.

The Michigan Experiment Station found that when cows were fed whole corn, about 23 per cent of the kernels passed through whole and undigested, indicating that this much of the feed had been entirely wasted. When cows were fed whole oats over 12 per cent of them passed through undigested and when fed corn and whole oats, over 26 per cent of these feeds were not masticated. It is plain that the feeding of whole grain means a heavy loss.

It may be added that grinding feed for horses, especially those having impaired teeth which comes with advanced years, is profitable. The Illinois Experiment Station holds that ground grain is slightly more digestible than whole grain and it is usually considered by the best authorities that a 10 per cent saving in grain can be effected by grinding.

WISCONSIN AGAIN A SPRING WHEAT STATE

It is now about forty years since Wisconsin farmers ceased growing spring wheat. At one time it was the principal cash crop of the farm, but repeated cropping soon exhausted the elements necessary to the wheat plant and the yield sank down to less than ten bushels per acre. At that time our farmers were very poor managers of their soil. There was but a small amount of live stock kept and but little intelligent rotation of crops. Then the dairy agitation began and has been kept up until this state today has a cow population, together with its young stock, not exceeded by any state in the Union.

This condition exists, it should be remembered, with only about half of the area of the state under cultivation. The live stock factor forced all our farmers into a better system of rotation with clover and alfalfa which, with the great addition of barnyard manure, has brought about a great change in our soil. It is now noticed that wherever spring wheat is sown on these old lands it returns a satisfactory yield. As high as fifty bushels per acre has been reported in many sections.

Last spring saw a few acres sown on a large proportion of our old farms. Another year the area devoted to spring wheat will be largely increased. The same is true of all the middle western states, and the result will prove a great addition to the nation's supply of wheat. The lesson to be learned from this is that if we would keep up our farms in their productive energy we must make live stock a leading factor in all of our farming operations.

BARLEY AND OATS FOR COWS

In many sections of our country splendid crops of oats and barley were grown this season. Barley is cheap in price compared with other grains. It is worth about $1 per bushel or $40 per ton. Oats are selling for 65c per bushel or a little more than $40 per ton. It is our opinion that ground barley and oats should be fed at these prices to dairy cows.

In Denmark, a mixture of barley and oats is considered an excellent feed for dairy cows. Barley has nearly the same feeding value as corn and good oats are superior to bran as a feed. Corn selling at $65 a ton and bran from $32 to $45, and only limited quantities obtainable, make it wholly feasible to consider barley and oats as a cow feed.

Without clover or alfalfa hay, or some other hay rich in protein, it will require some feed very rich in protein in order to supply the proper amount of protein to carbohydrates in a ration. If a dairyman has silage, timothy hay, barley, and oats, then some such feed as cottonseed meal, oil meal, distillers grains, gluten feed, or velvet bean meal should be purchased. A mixture consisting of 300 pounds ground barley, 300 pounds ground oats, and 100 pounds cottonseed meal or oil meal would make a very good mixture to supplement the timothy hay and silage. It would require about one pound of the mixture to produce 3½ pounds to 4 pounds of milk testing 3.5 per cent. If gluten feed, velvet bean meal, or distillers grains are used, it would be well to mix 125 to 150 pounds with the amount of barley and oats suggested. If there is a small amount of either alfalfa or clover hay, then we would suggest that feeding about 5 pounds to each animal daily, supplementing it with timothy, would be sufficient.

The ration containing a little clover or alfalfa would provide a little more protein which would not be out of place. Timothy hay is low in protein and when it furnishes the only dry roughage with the grains we have suggested, the protein content of the ration is scant rather than liberal in supply. It should be borne in mind that an inadequate supply of protein tends to reduce the milk flow. It is very often the limiting factor in production.

EDUCATE THE CONSUMER

It is our deep conviction that in order to secure fair prices for dairy products a greater demand must be created for them. To create this demand, the consumer must be educated regarding their importance and food value. Over five years ago we started to set forth the results of Dr. McCollum's experiments and, from that time to this, have published articles from his pen and editorials concerning what his investigations have shown regarding the necessity of milk. We have not been content to simply give the scientific side of this question but we have secured articles from various sources setting forth ways and means, as well as the feasibility, of educating people concerning the food value of milk and its products.

One of our subscribers, Dr. I. W. Houston of Michigan, comments as follows upon a recent communication:

"It has just been my pleasure to read 'When Aladdin Rubs His Lamp' in your current issue. You paid a high price for that article if it were in proportion to its worth. It 'hits the bull's eye' in every sentence. Big advertising is the only thing that will set the people right on the milk question. Put Helen Willcox at the head of a national organization and it is sure to win."

We sincerely believe a systematic educational campaign should be conducted to educate people not only as to the food value of whole milk but skimmilk as well. Few people realize the splendid food value of skimmilk. Our government informs us that 100 lbs. of skimmilk will make about 16 lbs. of cottage cheese and a pound of cottage cheese is equal to a pound of beef in food value. We have millions of pounds of skimmilk which could be diverted from the feeding of live stock to the feeding of human beings. What a tremendous source of food supply skimmilk offers!

It would be appropriate to teach people the relative food value of cheese and meat and also the importance of butter. At the present time there is a tremendous demand for both butter and cheese and it is somewhat doubtful whether an advertising campaign, as advocated by some, should be inaugurated now. But we are sure, however, that the matter of educating our people regarding the necessity of milk and skimmilk should be carried on at this time.

MORE FARMS TO FEED THE NATION

The day of a free and fertile public domain, "with a farm for every man", has passed and the discussion by Mr. Moulton in this issue of the reclamation of waste lands is opportune as to time and occasion. It is no new question, but now when the world is crying for food and the hearts of the American people are in a state of exaltation, its force may be driven home to the consciousness and approval of the public mind. It looks forward to the future, and gives the further opportunity of emphasizing the fundamental importance of agriculture.

Each state and each community has its particular reclamation opportunity. There is irrigation for the desert, drainage for the swamp, and clearing for the cut-over lands. Irrigation projects appeal to the imagination. They are large and important, but let us not forget those things nearer home—opportunities that may be homely and commonplace, yet offer fully as great opportunities.

We recall that last year there was presented to the legislature of Wisconsin a plan whereby thousands of acres of the cut-over lands of that state would have been made more quickly ready for the plow and which would have made the farming of these lands more attractive. It took on the guise of state aid, yet it was not a charity or a gift. The state was merely to lend its credit to the home builder that he might clear a sufficient portion of his farm to make him self-supporting. Possibly the proposed act needed improvement, and perhaps the time was not ripe, at least the legislature did not pass the measure. Be that as it may, Wisconsin, and other states as well, should give heed to this question and not delay until too late.

It is a long, hard, bitter struggle for the pioneers of the twentieth century to build their homes amid the wilderness of stumps. Most of them come with little more than their two hands to wrest from the soil a living and a life. They have been attracted by the cheap lands and may have had sufficient capital to pay the purchase price, but development of these lands has been slow and the first few years sees only small clearing accomplished at the expenditure of much time and untold sacrifices. Men have done it, more of them than seems possible. They are to be honored, but it has meant a relatively slow development. How much more attractive it would be, how much better for the individual and the state, if these men could be given aid in making their clearings and so begin almost at once to produce agricultural products in profitable quantities instead of spending the first few gruelling years in getting the land ready to produce.

As we understand it, the practical working out of the plan would be for the state to arrange and pay for the clearing of a certain portion of each new farm, the farmer to contract to repay this cost in certain reasonable and adequate installments. The work would be done on a large scale and done more economically. The cost of clearing would at once add to the intrinsic value of the land, but more important than all else it would provide the state itself with an immediate larger production of food crops and bring her a citizenry of more independent farmers. As the number of profit-making farmers of the state increases, so would all business within the state profit. It would not be a charity that destroys character and industry, but a well balanced industrial and financial operation that would redound to the benefit of the individual farmer, to the benefit of the consumer, and in general to advantage of all citizens and so promote general prosperity.

Thoughtful consideration is essential, but forceful action must accompany it. We are not yet in position to point out just the minute method of procedure. Doubtless mistakes will be made, but those whose perceptions have been quickened by the driving force of the world need realize that a beginning must be made. Time and experience will demonstrate the best methods, but fundamentally the proposition is grounded on good business principles and in sound public policy.

CO-OPERATIVE SELLING

Laying plans for the effective prosecution of the war is leading farm organizations to consider co-operative effort more seriously than at any previous time in our history. Hoard's Dairyman, since its inception, has urged farmers to organize co-operative enterprises in order that they may work together effectively, for we know through such efforts, intelligently directed, a larger development and greater profits will come to the farmers. Mr. John D. Miller, at the meeting of farm organizations recently held in Washington, discussed national co-operative legislation. We quote as follows from his address:

"Farmers are not permitted to do collectively that what they have the undoubted right to do singly. * * * * The time has come when the united farmers of America should ask, as they have a right to ask, that the situation be clarified. If making collective sales of their farm products by the farmers is detrimental to public welfare, or against public policy, then such organizations should be clearly outlawed. If, however, such collective sales will give the farmer his fair share of wealth which he creates and will stimulate production, thus insuring an adequate supply of food, then such organizations should be clearly legalized. The present uncertainty has become intolerable."

The legislature of New York, last winter, passed a law whereby co-operative enterprises might sell their products collectively and not lay themselves liable to prosecution under the anti-trust laws of the state. The milk producers' associations have found it a violation of the anti-trust laws for their representatives to discuss milk prices with the milk distributors, or in other ways to seek to fix collectively the prices at which their product shall be sold. In some instances, action has been brought against these representatives. We consider it highly desirable that every state have a law which will permit co-operative organizations to sell their products collectively.

As Mr. Miller continues, "there is no danger

of monopoly. By restricting the income of such organizations to costs, no funds can be accumulated with which to corner markets or control supplies, nor will these organizations interfere with the law of supply and demand. They will prevent such interference."

Last winter Hoard's Dairyman published an article by Hon. Walter Drew, then Assistant Attorney General of Wisconsin, in which he discussed the feasibility and urged the passage of a law permitting under certain restrictions, co-operative and other organizations to sell the products of their members without violating the laws of the state. It is our opinion that the state legislatures this winter should give serious attention to, and place upon the statute books of the several states, laws similar to that passed by the New York State Legislature.

It is ridiculous for the federal and state governments to urge farmers to co-operate in preparing their products for market and then make it illegal for them to discuss prices with those who desire to purchase the products. It is impossible for the farmers to so organize as to form a monopoly. Their interests are too varied and too scattered. There is opportunity for them to co-operate in the many communities in preparing their products for market and in selling them. This opportunity should be extended to them in every state, as has been done in New York State.

Comparing Corn Fodder and Alfalfa Hay

I desire to buy a small field of corn for ensilage the corn averaging 3½ to 4 feet high and that will have to be cut before the ears are fully formed. The owner needs the fodder for cow feed but may let me have the corn in exchange for alfalfa hay of equal value to the corn as fodder, we to determine the amount of fodder it would have made from the amount of silage it makes. With alfalfa hay $25 a ton, what is the value per ton as cow feed of fodder such as the above corn would make? What is the proportionate weight of the fodder cured for feed, to the same ensiled as soon as cut?

Elgin, Ore. H. A. G.

As the one supplements the other, alfalfa hay and corn fodder are not directly comparable in feeding value and they are not properly interchangeable. Alfalfa is largely used because of its protein content and the corn fodder for its carbohydrate content. The following table gives the number of pounds dry matter and digestible nutrients in 100 pounds of each of these two feeds:

	Dry matter in 100 Lbs.	Protein Lbs.	Carbohydrates Lbs.	Fat Lbs.	Total nutrients Lbs.
Corn fodder—medium in water	82	3.0	47.3	1.5	53.7
Corn fodder—high in water	61	2.2	35.5	1.0	39.9
Alfalfa hay	92	10.6	39.0	.9	51.6
Corn silage—well matured	26	1.1	15.0	.7	17.7
Corn silage—immature	21	1.0	11.4	.4	13.3

From the description given it would be reasonable to expect that the corn fodder (the stalk and ears) would approximate the analysis given for that medium in water. Assuming this to be the fact, then the protein feed in alfalfa is three and one-half times as valuable as that in the corn fodder and the total digestible nutrients are approximately the same. Although we hold that a comparison of these two feeds is illogical, yet if it be insisted upon we would estimate that where farmers are exchanging these two in order to better fit their rations to their herds, then one ton of alfalfa hay might be given for a ton and a half to two tons of medium grade corn fodder.

It will also be noted from the table that silage made from immature corn contains about one-fourth as much dry matter as corn fodder that is medium in water. It will also be noted that in digestible nutrients the same ratio holds true. Therefore, without giving due regard to the increased value of the succulence in the silage, it should take approximately four tons of corn silage to equal one ton of corn fodder.

Perhaps a somewhat easier comparison would be to pay for the corn fodder on the basis of its value as silage and compared with alfalfa hay. This comparison is also objectionable for the same reasons as above stated, yet on the basis of total digestible nutrients one ton of alfalfa hay is worth from 3½ to 4 tons of silage made from immature corn, while in protein content it would take 10 tons of silage to equal 1 ton of good alfalfa hay. Roughly speaking, an exchange might be made of 1 ton of alfalfa hay for 6 to 8 tons of immature corn silage. Computing on this basis would eliminate a part of the speculative comparison and the exchange could be more easily made on the basis of the estimated contents of the silo.

Oat Straw and Corn Stover

Studying your answer to an inquiry appearing in the Dairyman recently concerning the value of oat straw and corn stover for dairy cattle, I somewhat came to the conclusion that it would hardly pay to harvest the corn fodder. I would like to know your opinion more definitely concerning the corn fodder. It is customary here to cut it off by hand, which costs about $3 an acre for medium corn. After it is husked and in the barn we cut it to stover, put it in the ration as the cows will take it. I have silage and if the stover is given first (once a day) a certain portion is eaten readily and the balance usually goes with the silage. I have more horses over the winter than I need and with the use of corn stover I think I can keep the feed bill down a whole lot and yet do justice to idle horses.

Gratz, Pa. J. M. B.

When given their proper place in a dairy ration, oat straw and corn stover may have considerable value. However, because of their low nutrient content they cannot be expected to take a large place in the ration. We have found them valuable in adding variety to the roughage of a ration, but with heavy producing animals do not believe that it is economical to force them to digest these coarse, low-valued feeds in an effort to secure any considerable amount of nutrients.

We believe the best practice on general dairy farms is to supply as much of a legume hay as the cows will consume, basing the ration rather upon this feed than upon supplying high priced concentrates in excessive quantities. The best supplementary succulent roughage which we know is silage, and when this is fed in addition to the legume a most satisfactory basis for a dairy ration is had.

We do not know of a better practice with the fodder which is not cut for the silo than to shred it into a dry place and feed it during the middle of the day in as large quantities as the cows will pick over. Late in the afternoon just before the night's feeding the refuse may be swept back under the cows and makes as good a bedding as we know. Used in this way we believe corn stover may have a very fair dairy value.

Straw and corn stover may be fed to horses if they are given about the same place in the ration as that recommended with cows. However, it must be remembered that idle horses require very much less feed than a cow which is working her body in the production of milk. With the grain, which will likely be fed to the horses, it is entirely possible that oat straw or corn stover will make a very satisfactory combination.

At the present prices of feeds we would by no means sacrifice either one of these roughages but would use them in the ration as supplementary feeds. With the cows, however, we would not attempt to displace high nutrient roughages with them.

Under usual conditions more fertility is returned to the soil through hauling manure from the stables, where stover is fed, to the field rather than leaving the stalks to weather over winter in the field.

Home-grown Feeds—Ration for Heifers

Will you kindly advise me as to which is the most profitable to feed, a mixture of corn, oats, bran, and oil meal, or a prepared commercial feed which can be bought in carload lots in the neighborhood of $60 here? If I mix the above feed I shall have to buy some oats and corn besides all of the other two constituents. I am fixed to grind and mix all my own feeds and in my estimation it is safer to know exactly what is in your feed if it is anything like as profitable. I have good alfalfa and corn silage. Corn can be bought now for $1.60 per bushel; oats, $60; bran, at about $40 a ton; and oil meal, at $70. Corn, however, ought to be cheaper when the new crop comes in. We shall use about 50 tons of grain.

Also, how would you vary this grain ration for growing heifers from 9 months to 2 years old?

Xenia, Ohio. F. T. F.

For many years Hoard's Dairyman has advised that so far as is possible the dairy ration should be made up of feeds grown on the farm. We have maintained that under most conditions a herd returns the greatest profits when home-grown roughages are fed with home-grown grains, supplemented only with such purchased concentrates as are necessary to give proper balance to the ration.

The most economical basis for a dairy ration is a liberal supply of a farm-grown legume hay, such as clover or alfalfa, and a supply of corn silage. We know a number of farmers who are making a very satisfactory production by feeding only these two roughages. All that the cows will consume is supplied. We believe that heavy producing animals would do considerably better if, in addition to such roughages, a concentrate mixture is supplied. The feeds listed are admirably suited to this purpose. We believe, however, that cottonseed meal may well be substituted for oil meal, when the latter is priced at $70 per ton, as it should be purchased at a price considerably below this. We suggest a grain mixture of 300 lbs. corn and cob meal, 200 lbs. of ground oats, and 100 lbs. cottonseed meal. This should be supplied to heavy milking cows at the rate of one pound for every 3½ to 4 pounds of milk produced.

At the prices quoted, oats is somewhat more economical than bran. If bran can be placed in the barn at approximately an equal cost to that of ground oats, it may be used to replace part or all of the oats in the mixture, although there is very little advantage in this.

We do not have quotations for this station on the commercial feeds, but do not believe they will be found more economical than the grain mixture suggested. Many of them are very good cow feeds and serve an admirable purpose where such feeds as corn and oats can not be secured at reasonable prices. Under the conditions mentioned, particularly when the farm is fitted for grinding grain, we believe the suggested mixture will be found more economical than feeding commercial feed mixtures.

Vigorous, growthy heifers from nine months to two years of age require very little grain if they can receive all of the alfalfa and silage which they will consume. In case some of the heifers do not grow as rapidly as is desirable, it will be wise to supply grain in addition to the roughage.

Driven Wells

On my farm we have to depend on the catchment of rain water for our stock and when we are short of rain, experience great difficulty. I have decided to erect a well on the premises and I am advised by several engineers that I am sure to strike water. I was informed by a friend some time ago that a driven well is the easiest and cheapest proposition and I would like you to advise me on the subject.

Kingston, Jamaica. G. N. P.

A driven well is constructed by attaching a sharp point on the end of a pipe and driving the pipe into the ground until water is reached. Additional lengths are added to the pipe as required. The point consists of a short length of pipe with perforations which allow the water to enter the pipe and keep out sand.

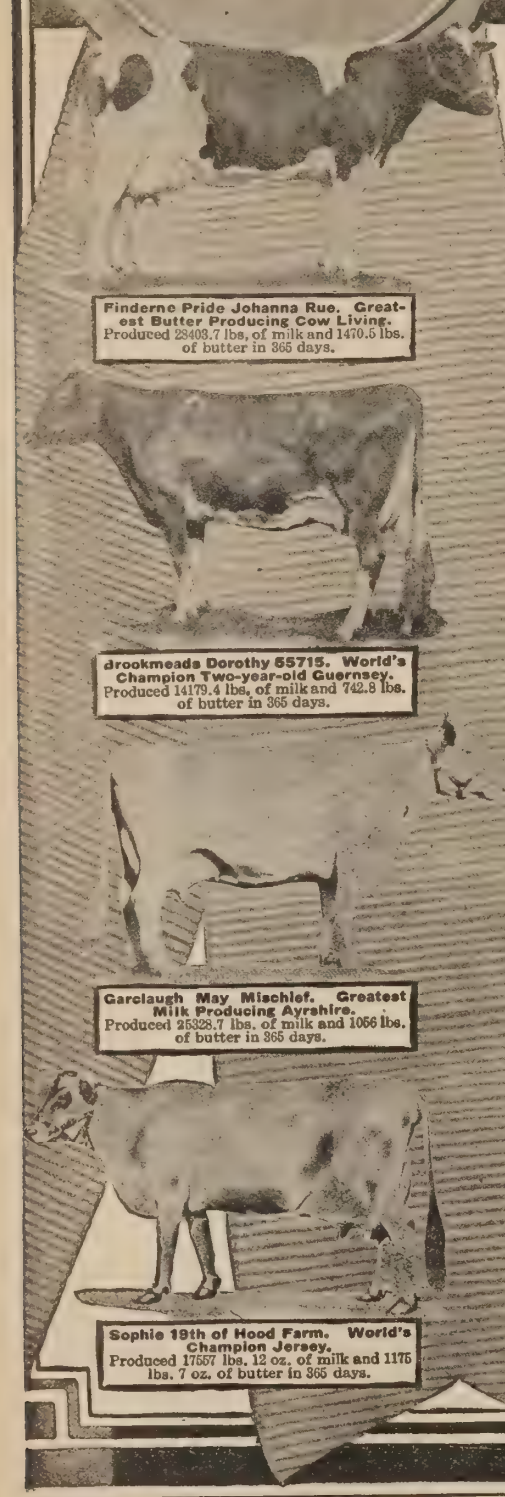
Driven wells are suited only to special conditions. A driven well is shallow, usually about 25 feet deep, seldom more than 50 feet. This would require that good water be obtained at this depth. Driven wells can be used to the best advantage in sandy soil. Where boulders may be encountered or where there is doubt of reaching a water bearing sand strata, a driven well should not be attempted. The character of the underlying strata in a locality and the depth at which good water is obtained can usually be ascertained by consulting a local well drawer. Geological reports on a locality may also contain this information.

L. M. SCHINDLER.
Wisconsin College of Agriculture.

Chopped vs. Ground Alfalfa

The following is published in reply to an inquiry concerning the relative merits of chopping and grinding alfalfa:

So far as we have been able to discover there are no practical differences in the feeding value of these two forms of alfalfa. Bulletin 164 of the Nebraska Experiment Station, lately published, records results from feeding chopped alfalfa which are as favorable as could possibly be expected. The data indicates that chopped alfalfa had a somewhat higher feeding value pound for pound than wheat bran. Other experimental evidence has pointed out the high nutritive value of chopped alfalfa and has seemed to give ground alfalfa no preference over it.



It must be remembered that alfalfa is a roughage and that grinding it ever so fine will not make a concentrate out of it. With animals which have so poor teeth that they can not thoroughly masticate their feed, there is undoubtedly some advantage in grinding the feed fine. This, of course, would apply to alfalfa. With animals which have good teeth and sufficient time to masticate their feed, however, we believe that animals secure fully as much nutrition from chopped alfalfa as from finely ground and that fine grinding will in no degree increase the digestibility.

Henry and Morrison make this statement on this point: "In case he (the stockman) desires to mix hay with heavy concentrates the material may readily be cut sufficiently fine in a silage cutter."

28 World's Champions

HOW THEY WERE FED

When They Made Their World's Records

YOU may not expect to make any world's records with your cows, but you do want to get the greatest yields from your cows—the bigger the yields the bigger your profits. The same feeding plan that the owners of 28 World's Champions have found to be the best, will be the best plan for you to follow.

Bernhard Meyer of Finderne Stock Farms, Finderne, N. J., owner of FINDERNE PRIDE JOHANNA RUE, the greatest living butter producing cow in the world, tells how he fed her when she made her world's record of 28403.7 lbs. of milk and 1470.5 lbs. of butter in 365 days. He writes:

"We have made another World's Record with our Holstein cow FINDERNE PRIDE JOHANNA RUE. I am glad to say that during her test she was fed mostly on your SCHUMACHER FEED which in my estimation is a very valuable feed for dairy cows."

When SOPHIE 19TH OF HOOD FARM made the record of 17557 lbs. 12 oz. of milk and 1175 lbs. 7 oz. of butter in 365 days, the record that made her the World's Greatest Jersey Cow, this is how she was fed:

"We have been feeding SCHUMACHER FEED to SOPHIE 19TH OF HOOD FARM. She finished her record last January 20, 1914, which makes her the Champion Jersey Cow of the world, and stamps her the greatest dairy cow living or dead. We consider SCHUMACHER FEED a splendid feed for dairy cows and a strong factor in increasing milk and butter production." HOOD FARMS, per J. E. Dodge, Mgr.

Dr. E. S. Duebler, Supt. of Penshurst Farms, Narberth, Pa., wrote us as follows after their great Ayrshire Cow GARCLAUGH MAY MISCHIEF made her world's record:

"GARCLAUGH MAY MISCHIEF who completed her year's test Dec. 26, 1915, with a record of 25328.7 lbs. of milk and 1056 lbs. of butter, was like our former champion AUCHENBRAIN BROWN KATE 4TH, fed your SCHUMACHER FEED as a large part of her ration. We now feed SCHUMACHER FEED not only to our test cows, but to all of our young stock with satisfactory results."

Again, when BROOKMEAD'S DOROTHY 55715 made the record that established her as the World's Champion 2-year-old Guernsey, SCHUMACHER FEED was a part of her ration. Her owner, Frank Graham Thompson, wrote us as follows:

"During her test she was fed a ration which was made up largely of SCHUMACHER and Buckeye Feeds and her completed figures and those of our other cows on A. R. test are sufficient evidence of the results accomplished with this feed."

24 other World's Champion Dairy Cows made their World's Records with SCHUMACHER FEED as the carbohydrate part of their ration. Let the experience of these owners of World's Champions, as well as thousands of other successful dairymen, be your guide in selecting your dairy feed. Feed SCHUMACHER FEED as the carbohydrate part of your ration and let BIG "Q" DAIRY RATION supply the protein content and you will get maximum results over long milking periods at the lowest cost.

Watch for our next advertisement, announcing two more World's Champion Cows, fed on SCHUMACHER, whose records are nearing completion.

The Quaker Oats Co. Address CHICAGO U. S. A. (106)

The Heart of the Dairy Farm Folks

HOARD'S DAIRYMAN:—The dairy farm folks of our neighborhood came to silo filling this year just about as the "line storm" was due. There had been a hard frost along the valley, cutting corn badly and compelling us to put our ensilage in a little earlier than we had been in the habit of doing. As often happens, we would all have been glad if the work could have been done at about the same time. This was impossible, however, for our part of the country as yet has only one rig to do such work. By uniting their forces, a couple of our young farmers have bought an engine and cutter, which will, by working from place to place, fill all our silos in a few days. The plan calls for the exercise of some patience, and when the weather is "catching," as has been the case this year, some of us have to wait for some time.

Then, too, we have all been hampered by the lack of hired men. Many of the boys are away in the army; some big factories a few miles away have added to the difficulty by attracting boys and girls away from the farm by paying higher wages than the farm folks are able to do. Some old men are left yet and the middle aged men who own farms hire them wherever they can, willing if need be to work a little harder themselves and get along with the hands of slackening pace, if by so doing they can help along about winning the war. After our help were all on the ground the other day, my son looked the little company over and said, "Everyone of those men except two are registered for the next call." After that has still further depleted our ranks, then what?

But the heart of the farmer folks beats wonderfully true. The world war seems to have drawn them closer together, and they come to the help of each other in times of stress like silo-filling in a fine way. We had plenty of help and the unpleasant conditions did not prevent them from staying right on the job from farm to farm till all our silos were filled. By changing work and by picking up here and there an extra man, we got along first rate.

It was a big job for them all, the weather being so bad. The corn had been cut a little before the arrival of the machine, of course, so that it might be ready to draw at once. Lying there, it got soaking wet in the storms which came one after the other for the space of a week or more. At some places the men worked right out in the rain, and that, too, without complaining, until they were wet through from head to foot. When it did not rain, the bundles of corn were dripping wet. The men were soaked through all over their breasts and the fore part of their bodies; but they laughed about it and had a good time together. Talk about heroes! The dairy farm folks are doing themselves proud in these days of tug and tussle. They work and save and strain every nerve to subscribe for the liberty loans as they come along; they send their boys; they do without things they actually need on the farm and in the house; they work early and late and put the last ounce of energy into all they do so that the country may win the war. The glory of their sacrifice will never be found in any history—they do not care for that, but they are just as worthy of credit as the men of the armies across the seas.

Nor is it the men folks alone who are doing their best these days. The women are a match for their husbands at every point. Even on the farm there are drawbacks about getting the food necessary to care for a little army of silo fillers. Help in the house is scarce as well as out of doors. But here, too, the women come to the rescue of each other. They help each other in peeling potatoes, baking, getting the table ready, taking up the food and serving it at mealtime, as well as washing the great piles of dishes that must be made clean before the next meal comes. The dairy farmer's wife is no less a hero than is her husband.

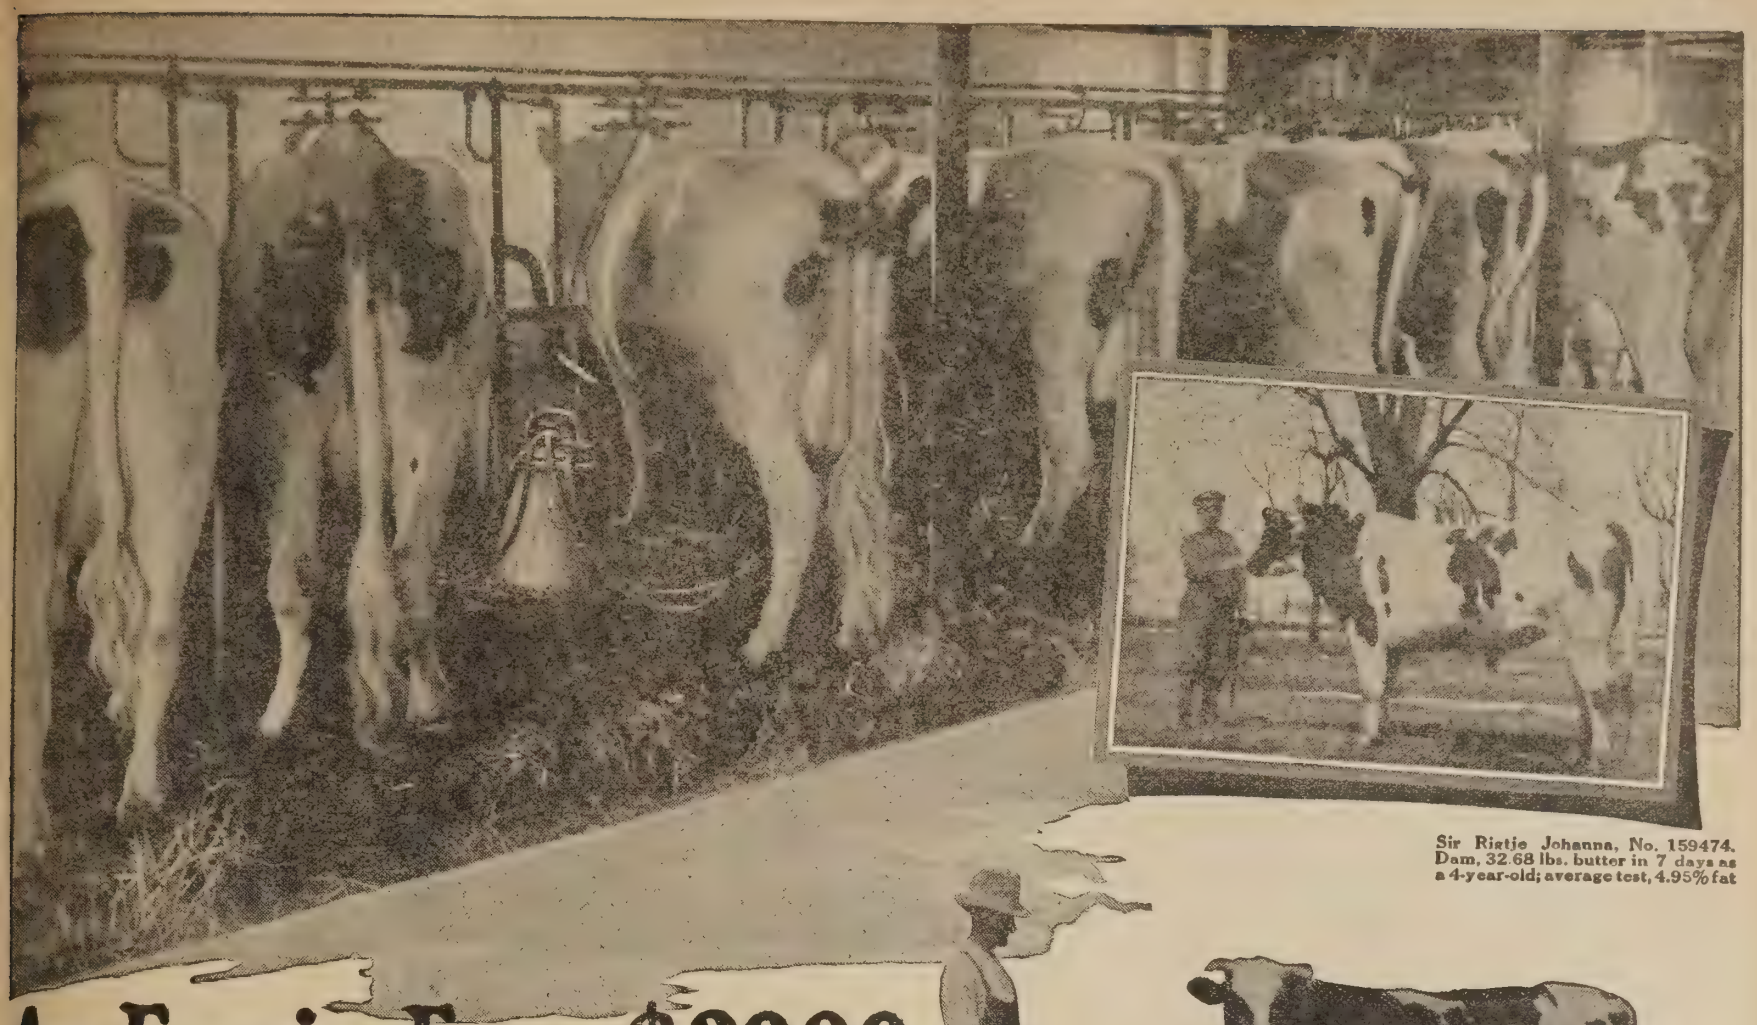
New York. E. L. VINCENT.

Wisconsin Live Stock Meeting

A meeting of Wisconsin live stockmen and dairymen will be held at Green Bay on Saturday afternoon and evening of October 19th. The following splendid program has been prepared:

Afternoon

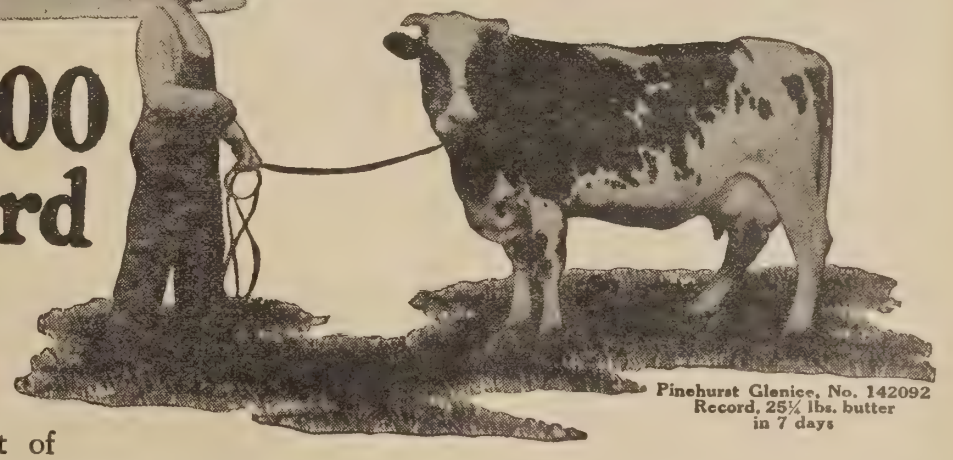
1:30 Patriotic singing
1:45 Why Dairying Must Be Maintained
2:05 Discussion A. J. Glover, President Wisconsin Dairy Council
2:15 The Nation's Call for Improved Live Stock
2:45 Discussion B. H. Rawl, Chief, Dairy Division U. S. Bureau of Animal Industry
2:55 Getting the Right Sire
3:15 Discussion D. S. Bullock, Field Representative, Wisconsin Live Stock Breeders' Association
3:25 Making Cow Testing a Big Factor in Live Stock Improvement
3:45 Discussion F. G. Swoboda, District Supervisor, Wisconsin County Agents
3:55 Helping to Finance Live Stock Enterprises
4:10 Discussion W. L. Wagner, Citizens' National Bank, Green Bay



Evening

7:30 Special Musical Program
7:45 Interesting the Boys and Girls in Live Stock Improvement W. L. Houser, President Wisconsin Live Stock Breeders' Association
8:30 What the War Means to the Stockman, Mr. B. H. Rawl

Butter Profits Must Not Rise With Market



The Food Administration is turning the full power of its enforcement machinery against dealers who are attempting to reap large profits from the rising butter market. Under Food Administration rulings, butter, both storage and fresh, must be sold at prices not to exceed a stipulated margin over cost. Dealers are not allowed to profit by abnormal advances in market quotations.

Your grocer is pledged to full cooperation in the Food Administration program. Are you helping him to keep that pledge?

Sir Rigtje Johanna, No. 159474. Dam, 32.68 lbs. butter in 7 days as a 4-year-old; average test, 4.95% fat

An Empire Earns $2000 Per Year On This Herd

Pinehurst Glenice, No. 142092 Record, 25¼ lbs. butter in 7 days

ARE you still milking your cows by hand? Are you and your help spending valuable time on milk stools when your efforts are sadly needed in the fields? Are you considering cutting down your Dairy Herd because of the impossibility of getting good men or on account of increased feed costs?

Don't do it! Read this letter from Mr. E. C. Peebles of Fond du Lac, Wisconsin. Despite labor difficulties and increased costs Mr. Peebles has found the way to increase his milk production and double his profits.

He was the first successful milking machine user in his neighborhood. During last year his *EMPIRE* Milking Machine enabled him to double his income. During the last four years it has paid for itself a great many times over. Can you imagine any form of investment that will produce greater returns than this?

An *EMPIRE* Milking Machine will do for you just what it has done for Mr. Peebles and thousands of other successful dairymen. It will increase your profits, reduce milking costs, benefit your cows, produce much cleaner milk and enable a boy or girl to do the work of three or four hand milkers. It will solve your labor problems, increase milk flow and lengthen periods of lactation. Its action is uniform and gentle—the same at every milking.

Investigate its value to YOU. Write for catalog 31 and the name of the EMPIRE dealer in your neighborhood.

Empire Cream Separator Company, Bloomfield, N.J.

Fond du Lac, Wis.,
May 25, 1918.

EMPIRE CREAM SEPARATOR CO.,
Bloomfield, N. J.

Gentlemen:

In regard to your milking machine, I can't say too much for it. This is my fourth year using the Empire Milker, and we didn't miss a milking for the first three years, milking about 30 cows year around. If I were to try to improve the working parts of this machine I wouldn't know where to start.

Last year our milk brought us over $4000.00, which is about twice the amount it would have been if we didn't have the milker. I was the first one in this neighborhood to get a machine that would work satisfactorily. Now we have about 50 Empire Milkers in a radius of 15 miles of Fond du Lac. Our cows are all Registered Holsteins and heavy producers. Our average test for winter at the creamery was 3.66, which goes to show that the milker doesn't interfere with the test if properly handled. Our herd is headed by Sir Rigtje Johanna, whose dam has a record of 32.68 lbs. butter, with an average of 4.95 per cent fat.

The heaviest producing cows of this herd are milked three times a day from November to May, when the noon milking was discontinued on account of other farm work. If a farmer only stops to think that a milking machine is used twice a day 365 days in a year it is the cheapest machine on the farm.

If more farmers would install milkers and put in the time they are sitting under the cows on their land it would be a great advantage to them and their country, besides making the work more easy.

Yours truly,

E. C. PEEBLES

Owing to the fact that the Farm Manager, Mr. D. M. Walker, "enters the service", Mr. Norton is compelled to sell this fine herd of

60 Head of Pure-bred Holsteins

This herd is composed of well bred cattle, has had fine care, and is free from disease. The herd is headed by a fine two-year-old sire, King Alcartra Pontiac Snowball a 33-lb. grandson of the $50,000 bull, King Segis Pontiac Alcartra. His two nearest dams average 34.89 lbs. His dam that made 33.19 lbs. butter in 7 days, 136.05 lbs. in 30 days, is a daughter of Johanna Rue Sarcastic Lad and from an A. R. O. daughter of Pearl of the Dairy's Joe De Kol. Not many men of this state or any other have bulls of better breeding. He is capable of being at the head of a wonderful herd. Most of the cows in the Norton herd are in calf to this bull, and in addition 12 of his young daughters are to be sold.

There are ***21 A. R. O. cows*** in the herd with nice records made under ordinary circumstances. Some fine two-year and three-year-old records, some of which are surely 30-lb. prospects.

KING ALCARTRA P
His sire is a 36.59-lb. son Snowball Pink, made 33.19

O
ra, the $50,000 bull. His dam,
bs. in 30 days.
E, WIS.

A ***30.36-lb. cow*** and her two daughters.

A great granddaughter of Colantha Johanna Lad with a 27.66-lb. record made at five years. Regarded as a great prospect for a large record, and in calf to "The King". Would you like her calf?

A wonderful 2-year-old daughter of King Segis Champion will be included. King Segis Champion is a 36.35-lb. grandson of King Segis and already has 15 A. R. O. daughters one of them with a record of 37.15 lbs. as a 4-year-old. The dam of this heifer is Fleet Artis Korndyke a daughter of Pontiac Korndyke with 31.03 lbs. butter 547.6 lbs. milk to her credit as a 5-year-old.

Moreover the heifer is due to freshen in November. She is bred to King Valdessa Pontiac the 40.32-lb. son of King Valdessa and Mable Segis Korndyke. This is a wonderful opportunity to buy the best breeding the country affords. For further information concerning this herd study your catalogs or write NORTON FARMS, FRANKSVILLE, WIS.

KORNDYKE HENGERVELD PIEBE 3RD, AN A. R. O. DAUGHTER OF SIR PONTIAC CHIEF, HE A 35.43-LB. GRANDSON OF SIR KORNDYKE MANOR DEKOL

This is one of the best cows in our herd. Give her a chance and she will unquestionably make very good for you.

COMPLETE

Dispersal Sale

Absolutely Nothing Reserved

We have 40 cows and heifers, heavy springers or will be fresh at sale time. THESE ARE REAL PRODUCERS, THE NICE, straight individual kind. 18 daughters are from very choice dams and the 38-lb. sire which we formerly owned. There are ten A. R. O. cows from 24-lb. two-year-olds up to 28.17-lb. cows. Eight choice heifers from A. R. O. dams. Daughters of King Model, King of the Pontiacs, and It. A son of King of the Pontiacs from 30.16-lb. daughter of Tidy Abbekerk Prince, who has 84 A. R. O. daughters. King Pontiac Bettina No. 204947 is as nice an individual as you often see.

A son of King Korndyke Sadie Vale whose two dams average 34.56 lbs. in seven days and whose five dams in direct pedigree average 33.514 lbs. These bulls are under two years of age and ready for heavy service and very desirable. One son of Rag Apple Korndyke 8th, from an especially fine dam.

Remember he is a half brother to the $53,200 bull. A bunch of young heifers and some good young bulls. In all about 85 head. Tuberculin tested by state authorized Veterinarian, with a 60-day retest privilege given.

If we can't please you we don't want your money. We want our cattle to be as valuable to you as your money is agreeable to us. Only one old cow, 26 lbs., which has 30, 27, and 24-lb. two-year-old daughters and two proven sons, the two-year-old yearling, and weanling will be in this sale.

Remember the day and date—

Tuesday, October 29th, '18

and govern yourself accordingly. Sale will be positive. Brookdale Stock Farm consisting of 200 acres well equipped and one of the best in Central Illinois, is for sale.

Also one set of Holstein Friesian Herd books complete with the exception of Vol. 7. There are 48 volumes and eight blue books.

WE ARE GOING OUT OF BUSINESS FOR EVER.

MILFORD MEADOWS STOCK FARM, - - LAKE MILLS, WISCONSIN.

Federal Crop Figures

In 1917 the total of crop acres in the United States, according to the Bureau of Crop Estimates, was 359,625,000 acres, an increase of 16 per cent over the area in crops in 1909. An estimate by the same bureau places the number of hogs in the country July 1, 1918, 3.3 per cent greater than on July 1, 1917; the number of cattle, 3.8 per cent greater; and the number of sheep, 15 per cent greater.

As compared with the supply July 1 last year there was, July 1, 1918, 102.7 per cent of butter, 100.3 per cent of cheese, 178.7 per cent dried milk, 178.5 per cent condensed milk, and 156.4 per cent evaporated milk.

The Two-year-old A. R. Record

A good many Guernsey people entertain the idea that if a heifer in her first milking period in Class G does not exceed 400 lbs. butterfat she is an inferior animal. That this is an erroneous estimate is shown by the after record of a good many cows. We note, for example, that the cow, Masher's Golden of Richwood 3234, made an A. R. record in her first period of 7,075.9 lbs. of milk containing 306 lbs. butterfat. This cow has just qualified in Class AA with a record of 1,530 lbs. milk containing 649 lbs. butterfat. So we see that it will not do to set down a heifer in the 300-lb. class as a slacker.

The Poorest Milker You Own Increases Her Milk Flow 25%

Save Grain For Bread

Prof. Pearson, **University of Illinois, before Chicago Milk Commission:**

"We can no longer afford to feed our high-priced grains to dairy cows. We must feed them the by-products. It is not right to feed grains which are good human food to animals that can do just as well on feed not fit for human consumption."

IT PAYS TO FEED YOUR COWS

A Complete, Correctly Balanced, Quality Guaranteed Ration

"With the high prices now ruling for feed and labor, on many farms—even where good dairy cows are kept—milk is being produced at little or no profit to the owner. Yet, by a wise selection of feeds other dairymen secure a good profit from cows no better."

—Profs. Henry and Morrison in "Feeds and Feeding."

A herd of "20 scrub cows" below the average yield of cows in the state, when taken to Kansas Experiment Station, increased their milk and butter yield to double that of the average in the state, through better care and proper feeding.

A like result, obtained with "scrub cows" in Minnesota Experiment Station, is attributed to three causes: Feeding a balanced ration strong in protein, kind treatment, extra feed in summer, to carry the cows through the drought with a full milk flow.

Geo. A. Pool, Ashton, Md., writes: "We have found Sucrene Dairy Feed decidedly the best of the dairy feeds, always being of a uniform grade and in good condition for feeding. Have never found a sample that did not grade better than the guaranteed analysis."

Harry Brown, Carlisle, Pa.: "Once when I was unable to get to town after a fresh supply of Sucrene Dairy Feed I fed a substitute which had been highly recommended. But it took only two days for my wife to ask why our cows were falling off in milk. Just as soon as I started feeding Sucrene again my cows began to give more milk."

J. S. Leed, Lancaster, Pa.: "In a 15-day feeding test my herd produced 903 gallons more milk at $6.26 less feed cost when fed on Sucrene Dairy Feed than when fed on a carefully mixed home ration. This has fully convinced me that Sucrene Dairy Feed is by far the best milk producer that can be purchased."

Sucrene Fed Cows Always Give More Milk Because They Are Properly Nourished

Sucrene Dairy Feed is a scientifically correct body maintaining and milk making ration. Its 16½% protein, 49½% fat and carbohydrates, and necessary ash and mineral matter, meet all the needs of the cow, every day, when fed only with the usual roughage. Composed of cottonseed meal, germ oil meal, corn distillers' dried grains and solubles, cocoanut meal, finely ground and bolted grain screenings, clipped oat by-product, cane molasses, calcium carbonate ½ per cent, salt ½ per cent.

Your cows will prefer Sucrene to any other feed because it is sweet smelling, appetizing, easily digestible, and because of its great variety of high grade feeding materials. Sucrene Feed is a complete ration as you buy it. You have no mixing to do—we have done that for you in the most perfect manner possible—merely vary the quantity in accordance with the cow's weight and her milk-producing capacity. Every sack guaranteed uniform high quality.

Sucrene Dairy Feed has a guaranteed analysis of 16½% Protein, 3½% Fat, 46% Carbohydrates, 14% Fibre. Every sack supplies cows with the nutrients contained in 550 pounds or 68½ gallons of milk.

Reduce Your Cost of Milk Production

Sucrene Dairy Feed brings you more milk per dollar of feed money than any ordinary ration. It leaves your high priced grain to bring you a quick, direct profit in the market. It is an all year profit maker, keeps your cows in better producing condition summer and winter.

Better lay in your winter feed supply now to avoid transportation delays. Order a ton from your dealer. If he can not supply you at once, write us and we will see that you are supplied. The coupon or a post card brings you free Illustrated Literature on care and feeding of farm animals. Write for it.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Boys' and Girls' Live Stock at the Wisconsin State Fair.

D. S. BULLOCK, Wisconsin.

ONE of the very pleasing features of the live stock exhibits at Milwaukee was the showing made by the boys and girls from different parts of the state. For nearly a year, in some instances, these youthful stockmen had been feeding and caring for their stock and during state fair week they came together from their various localities to show the results of their efforts. Forty-seven boys and girls exhibited dairy calves, beef calves, sheep, and swine. They brought in all nearly a hundred head of live stock to the fair.

FIRST PRIZE JUNIOR AND GRAND CHAMPION DAIRY BULL SHOWN IN BOYS' AND GIRLS' CLASSES BY KARL KLOEHN AT WISCONSIN STATE FAIR

It was indeed an inspiration to see these future showmen carefully looking after their stock. The manner in which the animals were presented in the show ring showed the results of careful work on the part of club leaders throughout the state. They were not all amateurs, however, and they had certainly kept their eyes open. It was a common sight in the cattle barn to see the older showmen preparing their animals for the ring and three or four boys or girls watching them. These boys and girls were usually those who had calves to show.

Eight different live stock clubs from six counties showed as clubs besides numerous individual entries from other sections of the state. Portage, Buffalo, La Crosse, Calumet, Waukesha, and Dane Counties were represented by live stock clubs. In the calf club competition Portage and Buffalo Counties were close competitors for first honors. Buffalo county showed both dairy and beef calves and had more animals than Portage County. The Portage County calves showed slightly better quality on the whole and, when the final score was determined, were the winners of first prize as a club. Buffalo County took second with Calumet County third, La Crosse fourth, and Waukesha fifth.

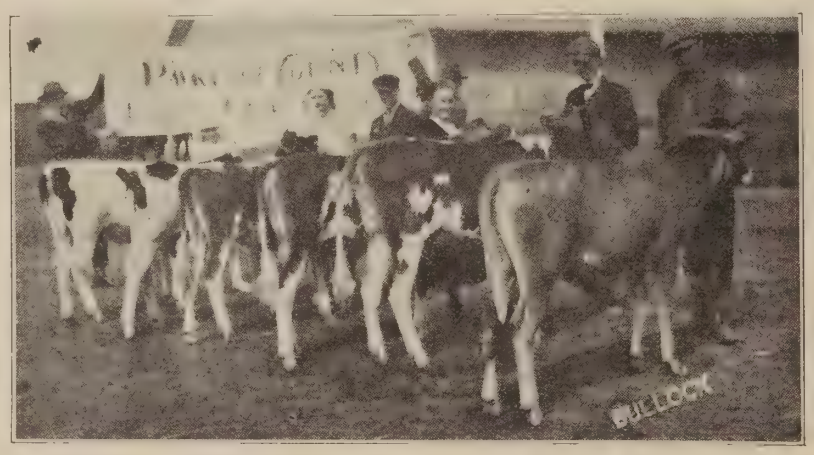
Buffalo County showed more sheep than any other and besides having the best individual sheep also won the club prize.

La Crosse County was particularly strong in the swine exhibits. Their members won most of the first prizes. Ruth McDonald of West Salem had the grand champion boar, a Poland-China. Walter F. Renk of Sun Prairie, Dane County, won first and grand champion on a Duroc-Jersey.

The first prize Guernsey heifer belonged to Ray Halverson of Russell, Portage County. The first prize Holstein was also from Portage County belonging to Esther Newby of Stevens Point. The Jersey heifer placed first came from Buffalo County and belonged to Jennie Houser of Mondovi. This Jersey heifer was grand champion dairy heifer calf of the show.

The first prize dairy bull calf was a Holstein and belonged to Karl Kloehn of Forest Junction, Calumet County.

In looking over the list of prize winners it is interesting to note how many of the first and second prizes were won by girls. The girls seem to be able to do just as well as the boys in caring for young stock.



Much of the stock shown by the boys and girls was exhibited in the open classes and carried off not a few ribbons. This shows the high class of the stock they showed. The boys' and girls' live stock exhibits at the state fair is one of the features that should receive far more local support than it now does. The educational value to the boys and girls of showing the results of their own efforts at a great state fair cannot be calculated in dollars and cents. It is building for the future. Fathers and mothers can well afford to encourage their children in this great work and next year there should be more Hoard's Dairyman Juniors among these junior showmen.

CHAMPION JERSEY AND GRAND CHAMPION DAIRY HEIFER, IN BOYS' AND GIRLS' CLASSES, SHOWN BY JENNIE HOUSER AT WISCONSIN STATE FAIR

The following were the winners in the different classes of live stock in the boys' and girls' classes:

Holstein Heifer (grade or pure-bred) Jr. Class	Prize

How Fresh Water-on-Tap Saves Labor

INSTEAD of pumping to water the stock, just turn a faucet and get a steady flow of *fresh* water—not storage water.

Instead of pumping and carrying water to the barn on cold days, have *fresh* water on tap—always at the same even well temperature.

For spraying and for all household uses, there are a hundred ways in which you *save labor* when you have a

NATIONAL
Fresh Water System

Water comes *straight from the well*—not from a storage tank. Delivered in a steady flow by compressed air, safest of all power, operating powerful air-driven pump in well itself. Absolutely dependable.
Write for full information—today.

Watch It Work at the Fair

National Fresh Water Systems in operation will be shown at the Wisconsin, Minnesota, Iowa and Nebraska State Fairs. Be sure to come to our booth and *see for yourself.*

NATIONAL Fresh Water System

More Light Than 20 Oil Lamps

AT LAST—the light of lights—A beautiful lamp that lights with common matches just like oil lamp, but makes and burns its own gas from common gasoline, giving a brilliant, steady, restful, white light of 300 candle power.

Most Brilliant Light Made

Brighter than the brightest electricity. More light than 20 oil lamps. Cheapest and best light made. Costs less than one-third of a cent per hour. Safer than the safest oil lamp. The

Coleman Quick-Lite

No wicks to trim—no globes to wash. No dirt, no grease, no glare or flicker. Absolutely safe. Fuel can't spill—no danger even if tipped over. **Guaranteed 5 years**—will last a lifetime.

If your dealer can't supply, address nearest office for Catalog No. 9

In addition to the above prizes the American Poland-China Record Association, the National Duroc-Jersey Record Association, the American Duroc-Jersey Swine Breeders' Association, the Chester White Swine Record Association, the Wisconsin Chester White Breeders' Association, the American Berkshire Record Association, and the Wisconsin Berkshire Breeders' Association offered special prizes for animals of their respective breeds.

Besides these live stock exhibits there was an excellent showing of poultry, corn, small grains and vegetables, and of course there were exhibits from sewing, canning, and baking clubs. In fact, there was a chance for every farm boy and girl, no matter what he or she might be interested in.

Junior Letters

Hoard's Dairyman Juniors:—This is my third letter to the juniors. My first letter I guess found the wastepaper basket. I am twelve years old and will be in the eighth grade at school this year. I live on a farm of seventy-six acres. We have eleven head of cattle and three horses. I feed the chickens every morning and night. I milk three cows every night. I have a brother and sister who are going to high school this year. I have joined the potato club contest and my potatoes are fine. My letter is getting long so I will close wishing some of the junior boys and girls would write to me. My address is Brookfield, Wis. Ellis Bolter.

Hoard's Dairyman Juniors:—I have not written for a long time. I have been so very busy. Our alfalfa is growing fine. We cut it in about three weeks. I expect to buy a pig next fall. I believe there are a good many juniors that own pigs. I have caught twenty-four fish this year. There is a mill race about five hundred feet above our house. I catch all my fish there. About a month ago my brother, Jacob, and I each set two hens. I got 17 peeps and he got 7. He gave me his and I have nineteen left which are growing fine. My father has a very sore arm which is threatened with blood poison. I will close wishing the juniors good luck.
Pennsylvania. Wilbur Getz.

Hoard's Dairyman Juniors:—I have three fine pigs from that sow I told you about in my other letter. My calf is doing fine also. My little Bantam hen has six little Bantams. That makes nine in all. Things down here in Tennessee are not doing very much. A dry spell came and baked them. It hit them just as they begun to form nicely.

I am going to school. We have a fine teacher. She will make you stand around. I love to read the juniors' page. We have only eight cows now and five calves, counting mine. Papa has a silo filler. He is going to fill silos this year.
Tennessee. Hazel Trent.

Hoard's Dairyman Juniors:—I will write a letter to let you know I have not forgotten I was a junior. My pigs are doing fine. I only have 7. I sold 4 to a neighbor at 16c per pound. I made $168.10 from them. All the money I get I buy war saving stamps with. I have $150 worth now and will buy more. We have 2 colts. They are about a year old now. Their names are Betty and Bird. I like Bird best.

I live on a 90-acre farm 2½ miles from Gravelford. I have been milking two cows lately. Everything is dry here. Our school will start Sept. 2nd. The teacher's name is Miss Hedwig Harnish. Good-bye and good luck to the juniors.
Oregon. Marion Clayton.

Hoard's Dairyman Juniors:—It has been a long time since I wrote to you. We four brothers have eleven ducks. We will sell them about Christmas time. We have five horses. We have sixteen milk cows; seven of them are pure-breds. I gather eggs and keep the wood-box full for mamma. I feed the calves three times a day for papa. I go swimming every night when it is warm. The water is three to four feet deep. I enjoy it very much. We will thresh next week. My youngest brother and I will carry water for the men. I am eight years old and am in the third grade at school. My address is R. F. D. 2, Box 78. Monroe, Wisconsin. Marvin P. Heitz.

Meet Mrs. Munson—who has two in the Army—and two selling W. S. S.

"MRS. ALGER tells me I look ten years younger since we got our Colt Lighting and Cooking Plant, and I believe her. I know I feel lots younger. It gives me more time to myself than I've ever had before. I visit friends now as I haven't done since I was married.

"Now that we have a Colt Light the Red Cross workers come to our house in the evenings to sew. They say it is a good deal easier to work by this soft, strong, white light, and they certainly do more work than they used to.

"I can't help smiling when I see the way boys have taken to calling on my two girls of an evening, to sing and dance or play games. The whole atmosphere of the place seems more alive, more wide-awake. The lights seem actually life-giving, as plants grow in the sun.

"Out in the barns the Colt Light is a perfect Godsend when the days begin to shorten. James has said to me dozens of times: 'Mother, since we got the Colt Plant this place runs like an automobile engine—easier and smoother at night than it does in the daytime.'

"All our old fear of the barns catching fire from matches or lamps has gone. We pull a tiny switch and the barn is flooded with light. We shut off the switch and out she goes. No matches or fuss with lanterns.

"Nothing would ever persuade me to go back to the old days, cooking with coal or wood or kerosene. Our Colt gas cooking range has forever banished those dreary hours over a hot fire! I shudder when I think of them. In the bottom of my heart I pity the poor women who are still chained down to such a tiresome, listless life. Cooking is a real pleasure with a Colt Cooking and Lighting Plant.

"And the Colt is so wonderfully simple! We've had it over a year and never know it is in the house. Not a sound. No chugging engines. Nothing to get out of order. The Algers have had their Colt Plant seven years and have not spent a penny for repairs."

(Business of making more flapjacks)

Carbide Lighting COLT and Cooking Plant
TRADE MARK

The Colt system costs less than any other. It is so small it can stand in a corner of the cellar or outbuilding. The operation of plain water on crushed stone (carbide) produces the gas. These are added once a month. It is so safe that 700,000 miners use it for miners' lamps. *Write us today for the names and addresses of enthusiastic neighbors, who can tell you all about it.*

Position wanted as manager or herdsman on up-to-date farm by young man, single, exempt from draft. Experience in A. R. O. work, best of references. Address BOX 262, care Hoard's Dairyman. 12-3

Must Teach Consumer the Food Value of Milk

The following is an extract of an address delivered by Mr. D. D. Aitken, president of the Holstein-Friesian Association of America, before a meeting of representative dairymen held in Milwaukee for the purpose of organizing the Wisconsin Dairy Council:

"I was invited to come here today and meet with you gentlemen who are interested in organizing an association for the purpose of educating the consumer to the great food value of dairy products. The committee that was appointed at the meeting held at Chicago where we had practically the same problems to cope with—was appointed with the one idea of disseminating information to teach the people of the merits of the products of the dairy cow. Strange as it may seem, there are only a few people even on the farms who know anything about the value of their own products. For years the National Holstein-Friesian Association has taken the position that it was up to the dairymen themselves to win for the cow the position she deserves, and for those who distribute the product of the cow to demonstrate the merits of their business. I feel we spend too much time in attempting to demonstrate that we are doing business at a loss. I feel that the effort we make in that direction is practically lost.

"There was every reason why at the outset of the war we should show the public generally, and particularly those in authority, what the actual cost was of producing the dairy products in order that the government and the public might know that we were not profiteers, and that we were entitled to an increase in the price of our products, on the theory of cost alone. I believe when we have demonstrated that, and it has been demonstrated beyond all peradventure, we should interest ourselves in a better way to extend our business and develop the industry.

"It seems so strange to me that a commodity absolutely necessary to life, looked upon with favor by every person, should be so difficult to bring before the public, and still so few know anything about the real value of the dairy products.

"The committee appointed for the national organization to work with the state, and through the state to bring about a better understanding of our industry, to educate the people to a more extended use of our products, has a great problem confronting them, and they will require the united assistance of all the different state, district, and county organizations to help them make a success of it.

"There seems to be something peculiar and strange connected with the sale of whole milk. I have never been able to understand it and I do not believe anyone else has. The average mother, if she is going to economize, commences by reducing the milk that is given to the children, the one of all things absolutely necessary to their vitality, their strength, and their growth. Did she know of its necessity she would not for the world forego its use, she would do away with something else and it will be up to this national organization to bring this information to the mothers of children. Increasing the cost of milk one cent per quart in large cities has been known to reduce its consumption twenty per cent, while doubling the cost of hundreds of non-essentials has not made any practical decrease in their use. The mystery must be explained, there must be some reason why the dairy products are not more appreciated.

"In the appointment of a committee I have appointed the best known men representing the different interests——the producers, the distributors, the buttermakers, the cheesemakers, the condensers, with an idea that they would all work together and try and solve the problem. I am satisfied if they will teach every mother of children the necessity and value of milk for her children, they could not supply half the demand. I am satisfied if the cheesemakers, buttermakers, and condensers can satisfy the public of the value of their production, that they will not be able to satisfy half of the demand. If I am right and this committee can organize the country and make the necessary arrangements to educate, to instill into the minds of the people the truth, then there is indeed a great future for the dairy industry. If our product has the merit we believe it has, we cannot fail and there is no risk in making the attempt. I have no fear of not being able to supply all government demands for export, for the reason that we could increase the production twenty per cent within thirty days any time if it were necessary, and if it was necessary there is no reason why a price should not be paid for this most valuable of all feeds that would make it profitable to turn into it the roughage, coarse food, and waste that now cannot be utilized for human food. I believe we should say to the government, 'whenever it is necessary to meet any demand you may have, call upon us and we will produce the results you desire', for certainly the government is lending us every possible effort, and has done more for the dairy industry in the last four or five months than we have been able to do in as many years. I expect the government to continue its work because those in authority are commencing to realize what our industry means to civilization, humanity, and to life, and are commencing for the first time to realize the necessity and are with us to the uttermost."

Hemp in Wisconsin

In the past few years the acreage of hemp in Wisconsin has materially increased. Professor R. A. Moore of the Wisconsin College of Agriculture has been giving special attention to the development of this crop, as there are large areas in Wisconsin admirably suited to hemp culture. There has been a marked improvement in the machinery to handle the crop and until recently it was largely taken care of by hand labor. In a recent bulletin published by the Wisconsin Experiment Station and prepared by Professor A. H. Wright, we take the following statements:

"Hemp has been demonstrated to be the best smother crop for assisting in the eradication of quack grass and Canada thistles.

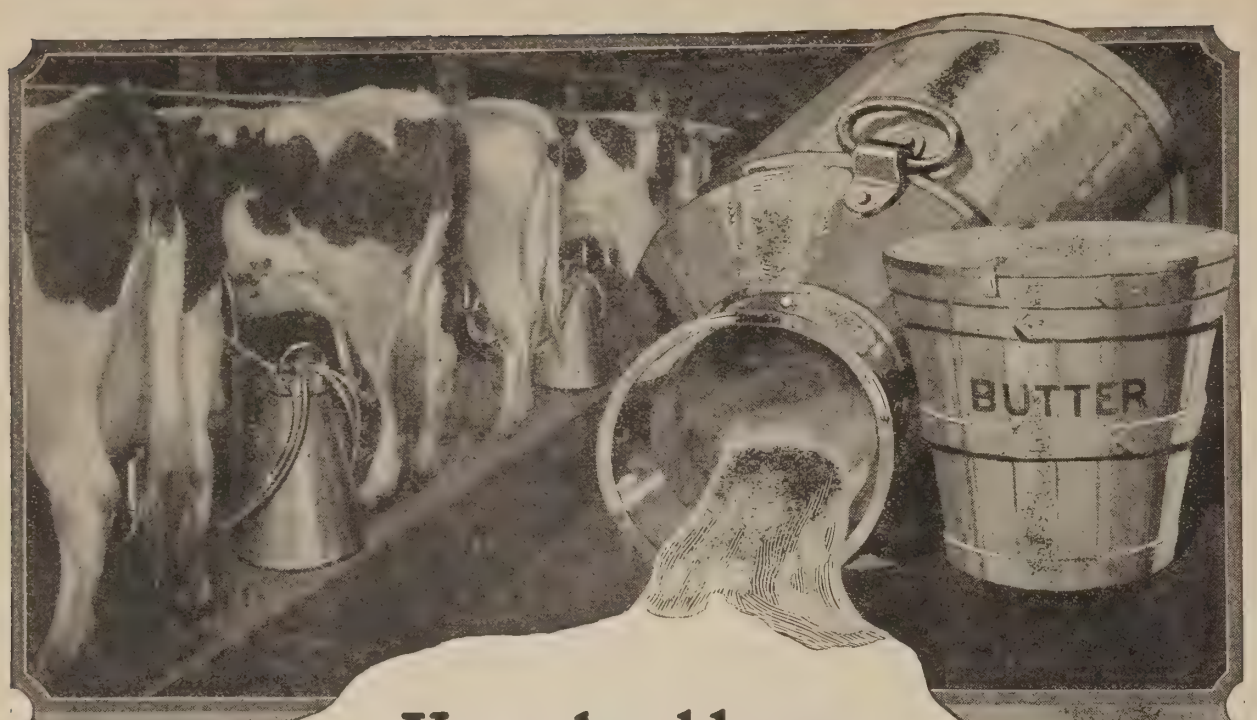
"Hemp has been grown in Wisconsin for ten years. It has been found that hemp can be grown very successfully in the state, that the climate and certain soils of Wisconsin are particularly suited to the crop, and that the development of labor saving machinery has made the hemp industry one of far reaching importance.

"Several hundred acres must be grown in a vicinity to make hemp production profitable. Co-operative growing is necessary. The state hemp association is stabilizing the industry in the state.

"Wisconsin is the second largest hemp producing state in the Union. The principal centers of production are Fond du Lac, Green Lake, Dodge, and Racine Counties.

"Hemp fiber is a national necessity. In addition to its important use for wrapping cords of all kinds, it is now being used for such vital purposes as thread for sewing army shoes and harness, as caulking in battle ships, and for binder twine.

"Hemp should be grown on fertile soil. Poor soils are not suitable. Hemp is not hard on land, for it removes less plant food than many other farm crops. It improves the physical condition of the soil and is a successful crop for smothering quack grass and Canada thistles.

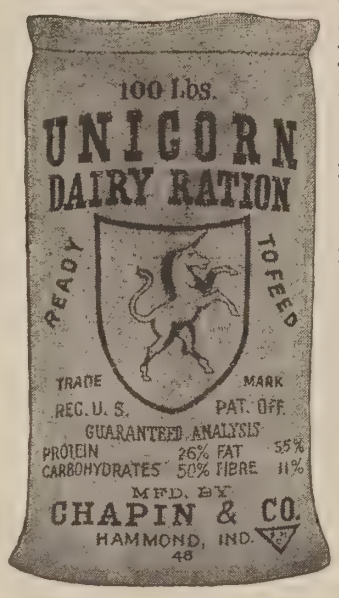


"Fiber hemp does not mature seed in Wisconsin; consequently, seed for planting is principally obtained from Kentucky. The seed weighs 44 pounds to the bushel and 40 pounds are required to plant an acre.

"Hemp is drilled in a well-prepared seed bed, in the spring, and requires no further attention until it is ready to harvest in September.

"Hemp is harvested with a special harvesting machine which spreads the stalks in a thin window. After remaining in the windrow several weeks, the stalks are tied into bundles, shocked, and stacked.

"The dry, cured hemp stalks are hauled to a breaking mill. Here the fiber is removed from the woody portion of the stalks. To perform this separation of the fiber, especially constructed and equipped hemp mills are necessary. Wisconsin now has nine of these mills.



"Large yields of hemp fiber are obtained in Wisconsin, averaging 1,200 lbs. an acre. The cost of producing the crop is from $8 to $11 more an acre than for small grain crops. The gross returns average $75 an acre. With the advent of modern machinery hemp can be produced just as easily as corn. Hand labor is no longer necessary and, as a result, the hemp industry in Wisconsin is firmly established."

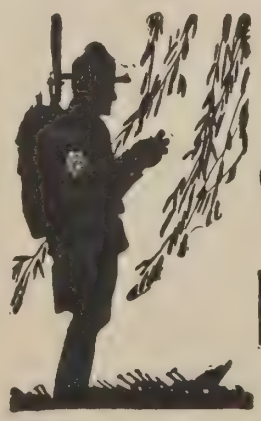
You should use

UNICORN DAIRY RATION

Because—it will make more milk and cut down you milk costs.

Because—you can save from 10 to 20% of your feed costs through the use of fewer pounds of grain per cow and the increase in milk or fat per cow.

Because—there is 10% more available food material in Unicorn than in any ration on the market.



Because—it saves labor and the mistakes of mixing and feeding. It is always uniform and reliable.

Because—Unicorn Dairy Ration is suitable for feeding alone, or can be fed with home-grown corn, oats or barley. Unicorn contains ample protein and may therefore be used either as a protein feed or as a complete ration.

The Man Who Delivers the Goods

There's a man in the world who is never turned down,
Wherever he chances to stray;
He gets the glad hand in the populous town,
Or out where the farmers make hay;
He's greeted with pleasure in deserts of sand,
And deep in the aisles of the woods;
Wherever he goes there's the welcoming hand,
He's the man who delivers the goods.

The failures of life sit around and complain;
The gods haven't treated them white;
They've lost their umbrellas whenever there's rain;
And they haven't their lanterns at night;
Men tire of the failures who fill with their sighs
The air of their own neighborhoods;
There's the man who is greeted with love-lighted eyes,
He's the man who delivers the goods.

One fellow is lazy and watches the clock,
And waits for the whistle to blow;
One has a hammer, with which he will knock,
And tells the story of woe;
And one, if requested to travel a mile,
Will measure the perches and rods;
But one does his stunt with a whistle or smile,
He's the man who delivers the goods.

One man is afraid he'll labor too hard,
The world isn't yearning for such;
And one man is ever alert, on his guard,
Lest he put in a minute too much;
And one has a grouch or a temper that's bad,
And one is a creature of moods;
So its hey for the joyous and rollicking lad,
For the one who delivers the goods.

—Walt Mason.

Who Owns the Automobiles?

A group of six rural counties in Wisconsin shows one automobile for every eight persons, while the average for the state is one automobile to thirteen persons, and the average of five counties with large city population shows only one automobile to nineteen persons.

Up to September 1st the Secretary of State for Wisconsin had issued over 200,000 licenses for motor vehicles, 187,000 of which were passenger automobiles. Estimating the population of the state at 2,500,000, it means one automobile for every 13 persons. It also means three motor vehicles for every mile of the 77,000 miles of public highways in the state.

In discussing these statistics, the Wisconsin Good Roads Association says in its recent publication:

Which do you prefer, to be a "1 to 684 shot" in Germany, or, a "1 to 13 shot" in Wisconsin?

This is a query which is raised by a comparative analysis of the automobile ownership, relative to population, in Germany and Wisconsin. We express it in "race track" language, which is pretty trenchant to the average man.

Back of the query and the comparison lies the fact that the automobile ownership, especially in rural districts, is a pretty accurate gauge of the relative prosperity of the average man. The normal rule is that the man who owns an automobile can afford to own it and to afford to own it he is in pretty fair circumstances. And beyond and above that the automobile connotes not only pocket prosperity, but is a social and recreational factor.

In the state of Wisconsin, with a population of 2,500,000 people, there are somewhat over 200,000 automobiles, including a relative ownership to population of 1 in 13.

In Germany, according to the latest available reports, 1914 (the automobiles today are all in war service), there was 1 car to every 684 people.

In Austria Hungary, 1 to 2,071; Switzerland, 1 to 611; Norway, 1 to 730; Italy, 1 to 1,002; France, 1 to 204; Great Britain, 1 to 268.

Let us go on with the analysis and interrogatory.

We will first take a group of counties with a heavy population of German extraction—Calumet, Dodge, Jefferson, Manitowoc, Ozaukee, Sheboygan, and Washington, and we find 1 car to every 9 people.

Then we say to you, Gottlieb Schwartz, which do you prefer, to be a "1 to 684" shot in Germany, or a "1 to 9" shot in your home county in Wisconsin?

And we take a county like Green and we say to you, William Tell, which do you prefer, to be a "1 to 7 shot" in Green County, Wisconsin, or a "1 to 611 shot" in Switzerland?

And we take a county like Trempealeau, with a heavy population of Norwegian extraction, and we say to you, Ole Olson, which do you prefer, to be a "1 to 9 shot" in Trempealeau County, Wisconsin, or a "1 to 730 shot" in Norway?

And we go to Milwaukee and we take our Hungarian friend, Carl Jonas, once a subject of the Austro-Hungarian empire, and we ask him, which do your prefer, to be a "1 to 19 shot" in Milwaukee or take the chance of being a "1 to 2,071 shot" in the empire of Carl of Austria?

And then we could take the Frenchman, the Englishman, the Irishman, the Pole, the Italian, and address him the same query.

Does any one doubt the answer? Not after reading how Wisconsin—the men sprung of German, Norwegian, Polish, Swiss, and all racial stocks have gone over the top—gone over the top literally in France, gone over the top at home in Liberty Bond, Red Cross, and other campaigns. The figures, however, "point a moral and adorn a tale".

The road to Berlin begins in America.

Rushing the Grain to Hungry Millions

These pictures will illustrate the widespread application of Federals to grain haulage; upper view, in the wheatfields of Southern Michigan; oval, in the Southwestern rice fields; lower, hauling Milo Maize on the good roads of California.

Federal Motor Truck Co.
Detroit, Michigan

THE greatest grain crop in the history of the nation—the greatest army to be fed in the history of the nation—war-stricken peoples of allied nations depending on America for bread—

Here surely is a real opportunity for motor trucks to prove their superiority over old methods of moving the grain crop.

And Federals are meeting it—just as they are meeting every other haulage problem.

In many instances they carry the grain from field to granary and thence on to the elevators at the great mills of the northwest, in this way avoiding the former need for storage of grain at small wayside elevators.

Motor truck haulage, as this application of Federal illustrates, has arrived most opportunely to aid in solving haulage problems of vital importance to our country.

FEDERAL

Gas Masks—You Can Help

Every American has the chance for direct war service that will save the lives of soldiers. Carbon is needed to make millions of gas masks for the American army. Cocoanuts have furnished much of this material, but cocoanuts mean ships, and during the present shortage, material for carbon must be found nearer home. The pits of apricots, peaches, prunes, olives, dates, cherries, and plums, and the shells of Brazil nuts, hickory nuts, walnuts, and butternuts make carbon for masks that will outlast the most diabolical of the German gases.

Here is work for all, every home, church, and school. Urge the boys and girls to scour the woods for nuts and incite your patriotic organizations to rivalry in making collections. See that the work is started in your neighborhood. Place collection boxes in schools, churches, banks, and stores, and above all in your own home so your boys and girls can see the pile grow. It takes two hundred peach stones or seven pounds of nut shells to furnish carbon for a gas mask and save the life of an American soldier. How many masks can your neighborhood furnish?

Dry the pits and shells before returning them to the nearest Red Cross chapter. This organization is in charge of collecting all material.—U. S. FOOD ADMINISTRATION.

THE FIRST

ANNUAL SALE

Of Mara Alva Guernseys

will occur on

Thursday, Oct. 31, '18

(Date Changed from Previous Announcement)

AT MARA ALVA FARM (Beginning at 12 o'clock)

SMITHVILLE, OHIO

5 Miles West of Orrville

Smithville has Pennsylvania R. R. and W. & L. E. R. R. service, and Cleveland & Southwestern Railway to Madisonburg sub-station.

To make room for another importation, we have selected from our herd of 175 head

75 Head for This Sale

Consisting of a few very fine show Bulls; about 60% Imported Heifers, bred and open, 40% American bred; a few fresh Cows and heavy springers; Heifers bred and open. Every animal especially selected.

We have sold privately in the last five years, 2,000 head of Registered Guernseys. This sale is held to try out the Public Sale plan, as Public Sales are becoming more popular. We consider this an opportune time to buy seed for the "After the War" demands.

The blood lines are of the most fashionable—Island and American.

Cattle have been tuberculin tested by U. S. Department of Agriculture B. A. I.

of Waukesha County

GUERNSEYS

November 6th-7th, '18

Waukesha, Wis.

November 6th SIXTY-FIVE PURE-BRED FEMALES AND MALES to be offered. This is the best selection ever placed in the sale ring by the WAUKESHA COUNTY GUERNSEY BREEDERS' ASSOCIATION. ADVANCED REGISTRY COWS such as: Esther of Maple Hill A. R. 523.3 lbs. at 3 yrs.; Miss Harvest A. R. 456.08 lbs. at 4 yrs.; Wern's Ora A. R. 396 lbs. at 2 yrs.; Lilly May Rose 2nd A. R. 502.28 lbs. Class A, and others.
Daughters out of A. R. cows with records of 572.52 lbs., 498.1 lbs., 502 lbs., 539.02 lbs., 444.29 lbs., 549.05 lbs., 407.07 lbs., 649 lbs., 468 lbs., and many others equally as good, all sired by bulls of popular breeding.
Three daughters of May King's Vrangue of Ingleside No. 15430.
Two daughters of Governor of Myrtle Place 2nd No. 40985.
TEN pure-bred bulls will be offered, that have the very best blood lines, tracing to the popular MAY ROSE breeding, including the following, and others as well bred:
1 son of Imp. Itchen May King 25174, and out of Donnington Goldie V, A. R. 796.52 lbs. at 3 yrs.
Langwater El Dorado No. 39136, grandams have records of 607.74 lbs. fat and 1003.17 lbs. fat.
2 sons of Langwater El Dorado No. 39136, and out of dams on official test.
1 son of Lady Lishman A. R. 698.84 lbs. fat.
A feature of the sale November 6th, will be the complete dispersal of the herd of Bailey Falls Farm, located at Genesee Depot, Wisconsin. The herd consists of females of May Rose breeding, many with A. R. records such as 477 lbs. fat at 3 yrs.; 551 lbs. fat at 5 yrs.

November 7th SIXTY GRADE COWS AND HEIFERS. Only very high class animals offered. Very best individuals. Practically all are fresh, or due to freshen soon.

November 7th THIRTY PURE-BRED GUERNSEY MALES will be offered. Everyone is a good individual, and of breeding that will increase the value of any herd.

Auctioneers: Love, Bailey, Benjamin. Write for an illustrated catalog.

Waukesha County Guernsey Breeders' Ass'n.

F. E. Fox, Secretary, Waukesha, Wis.

Abortion

Please tell me how to rid my herd of contagious abortion.

Bushville, Ill. G. H. M.

There is no specific remedy for contagious abortion disease, but it may disappear in time if you have each affected cow properly disinfected by a competent veterinarian and then disinfect the vagina of each cow and heifer every other day for two or three weeks before breeding. Also have the stable cleansed, disinfected, and whitewashed under supervision of the veterinarian who also should supervise the disinfection of the cows and the bull. He no doubt has a favorite disinfecting solution, but it may be suggested that normal salt solution or a similar solution of hypochlorite of soda is useful for vaginal and uterine cleansing and a solution of permanganate of potash or Lobell's solution of iodine.

Secretary of Agriculture Houston says: "Farmers are not spectacular performers. They do not furnish sensations and headlines. They work in season and out of season, from early dawn until dusk, but they do not work in the limelight."

Don't confuse lending with giving. Buying liberty bonds is putting money in the safest bank in the world at good interest.

Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, leads to ill-health, emaciation, diminished milk supply failure to breed, and often blood poisoning and death.

Hood Farm Breeding Powder

causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding.

"After four years of experience I find Hood Farm Breeding Powder very necessary, for keeping my herd from aborting. It cleans the cows out quickly and clean, they breed early and are sure to stand."

Stuart Bird, Cropper, Ky.

Try Hood Farm Breeding Powder once and you will never again forcibly remove the afterbirth.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75. Mention this paper.

C. I. HOOD CO., Lowell, Mass.

This Beats Dehorning

Fleming's Chemical Hornstop, used on very young calves, prevents growth of horns.

A 50 Cent Tube for 25 Calves

Horns never grow if Hornstop is used early enough. Money back if not satisfactory. Our "Veterinary Adviser" Free if asked for.

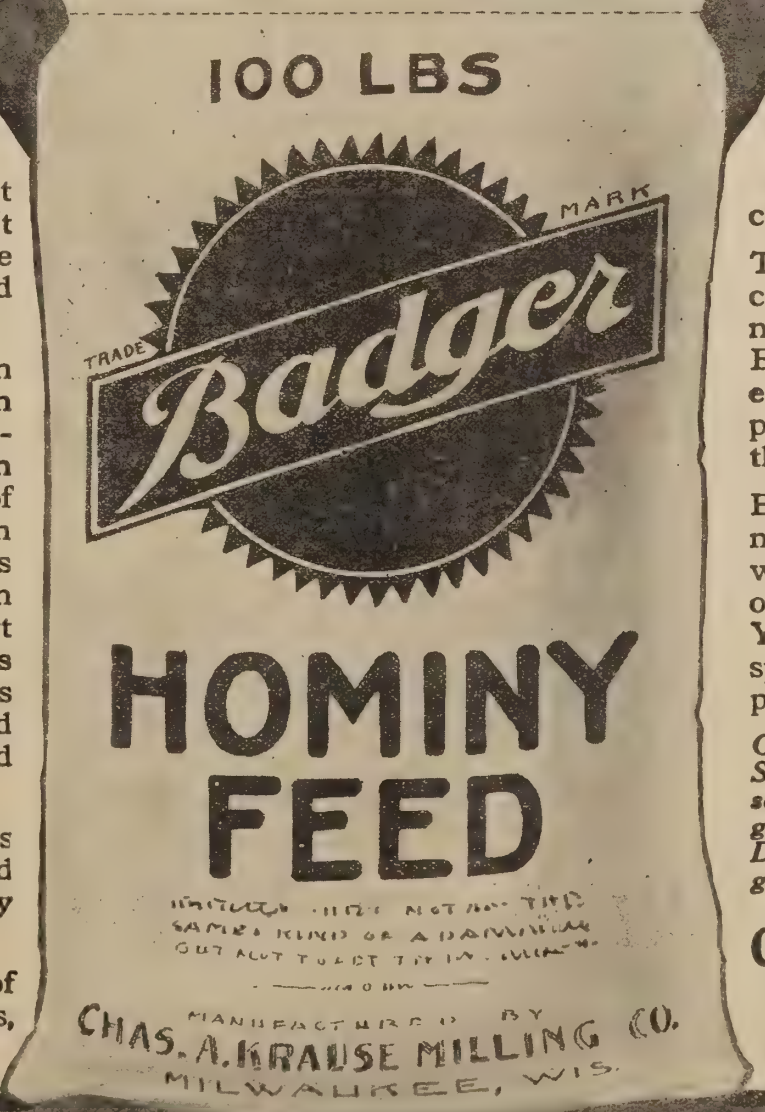
Have decided to sell my great herd boar, BIG BEN H, and will price him right. Also, some good heavy bone, big type Poland China spring boars to offer. All immune. Write at once. F. A. MOREHOUSE Lancaster, Wisconsin

THE BADGER LINE of FARM FEEDS

THE FEEDS WITH A HOMINY FEED BASE

IVE famous adger Feeds, ch made from proved formus, the result of ears of careful feedg tests by practical eders.



nd the base of each Badr Feed is ***Badger Hominy eed, the most nutritious sine feed stuff known.***

adger Hominy Feed needs no inoduction. It has been known and sed for many years by the most ccessful feeders in the country. It a carbohydrate feed that can be sed for all live stock—no other feed uff will take its place.

adger Hominy Feed is superior in eding value to the natural grain ecause it contains a larger percentge of tissue building material than ie whole corn and in the process of illing is partially cooked which akes it more digestible. In it is so included the mill run of Corn erm Meal—the germ or fatty part the corn from which the oil has een partially extracted. This makes adger a far more valuable feed an any other ordinary hominy feed n the market.

aluable as Badger Hominy Feed is a base, it is too rich to be used conomically alone except in a very w cases.

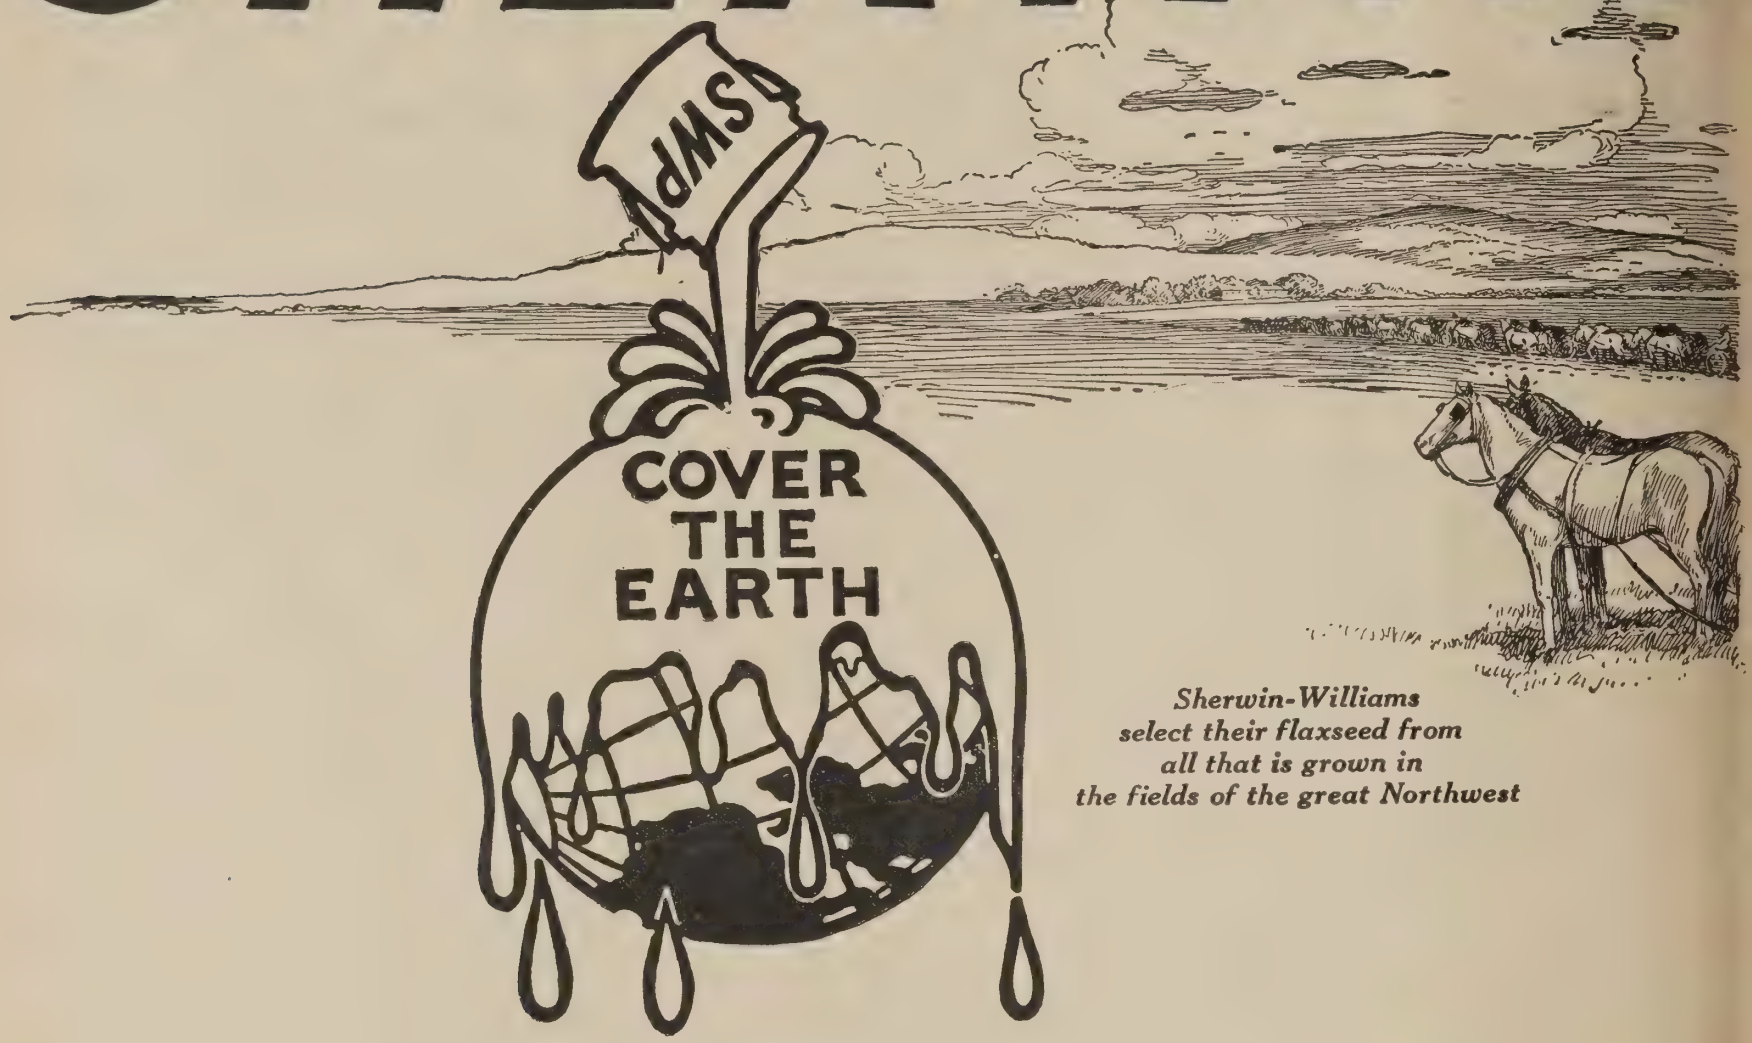
o secure the correct proportions of roteins, fats and carbohydrates,

Badger Hominy Feed should be combined with various other feed stuffs.

But in these times of extreme labor shortage, successful feeders cannot take the time to mix their own feed. They know also that the feeds they mix themselves cannot be as scientifically accurate and dependable as feeds that are prepared under tested and approved formulas and are chemically correct.

The proteins, fats and carbohydrates contained in different feedstuffs differ not only in quantity but in quality. Each Badger Feed contains a different combination of ingredients so proportioned as to make it exactly the right feed for its special purpose.

Badger Feeds are proved money makers, to which thousands of feeders will testify. They will cover the needs of every class of stock on your farm. You will find them absolutely reliable, splendidly adapted to their specific purposes and unvarying in quality.



Get your supply of Badger Feeds now. See your dealer at once. Send for free samples and literature covering Badger Cream City Dairy Feed, Krause Dairy Feed, Badger Calf Meal, Badger Hog Feed and Badger Stock Feed.

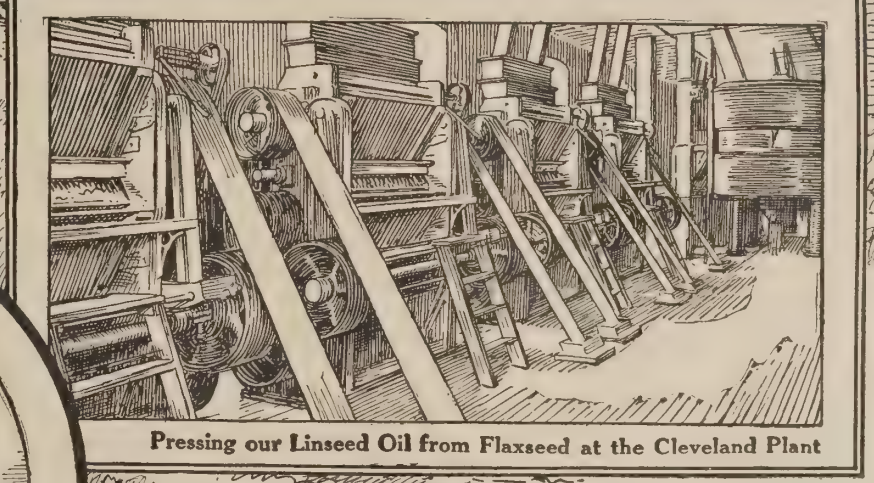
SHERWIN

Sherwin-Williams select their flaxseed from all that is grown in the fields of the great Northwest

WE put this trade-mark on everything we make. It is a mark of confidence—your confidence in us and in our products. It indicates many things and one of the things it means is this: In all the materials we use, as in all the methods we employ, no pains are spared in making the product you buy dependable.



We could not make a dependable product from materials of doubtful worth. That is why we go to the source and produce those materials upon which quality depends. This trade-mark, therefore, goes back beyond the product itself; it means that the essential materials from which it is made are also

WILLIAMS PRODUCTS

Pressing our Linseed Oil from Flaxseed at the Cleveland Plant

A few of the many tanks in which we store our Flaxseed

We control our sources of supply

ONE of the factors that has helped make The Sherwin-Williams Company the dominating dustry in its field is the steps it takes to quality. Manufacturers depending upon outside sources r raw materials are handicapped by shortages, rying quality and price fluctuations. We control our sources of supply. We produce our essential raw materials. One of these is linseed oil. We contract for the growing flaxseed, supervise its cultivation, ship it to our storage elevators, press the seed and refine the oil in our own plants.

Whatever the conditions, we are sure of our supply—always of the Sherwin-Williams standard—and you are assured of highest quality in the paint, varnish or other finishes that require linseed oil.

Linseed oil is but an instance, just as our chemical plants, our zinc and lead mines and our color works are instances of the extent to which we go in making each Sherwin-Williams product the best for your purpose.

Twenty-Six Million Cattle

needed to replace those of Europe at the close of war —and it will not be long

Be prepared to supply this demand with

PUREBRED

Holstein-Friesians

Begin now to build up your herds. Be prepared to take care of European wants for breeding stock which will require yearlings, two-year-olds, and young cows of good type and breeding to supply their greatly depleted herds.

The tremendous demand for Holsteins now existing in this country when augmented by that of Europe will create a demand far in excess of the supply.

Have something ready to sell.

HERE'S A REAL BULL

His Sire is May King's Vrangue of Ingleside, the May Rose sire whose first ten tested daughters averaged over 600 lbs. butterfat as 2-yr.-olds and 3-yr.-olds. His Dam is an imported cow now on test that will finish her year with at least 400 lbs. fat, milked twice daily. The Bull himself is a dandy—a calf that would show well in any ring. The right kind of a herd header to use.

Remember he's guaranteed to be right. Write me.

W. A. LAWSON, Rosendale, Wisconsin

The question of the hour

How Much are a Cows Teats Worth

Ohio Test—1917

131 Jerseys, 157 cows of competing breed, tested for one year by Ohio University—RESULT: "Jerseys consumed 18.2 more nutrients and produced 1.2 per cent more milk, 25 per cent more solids and *59 per cent more fat.*"

Official figures in Ohio University Bulletin.

St. Louis Test—1904

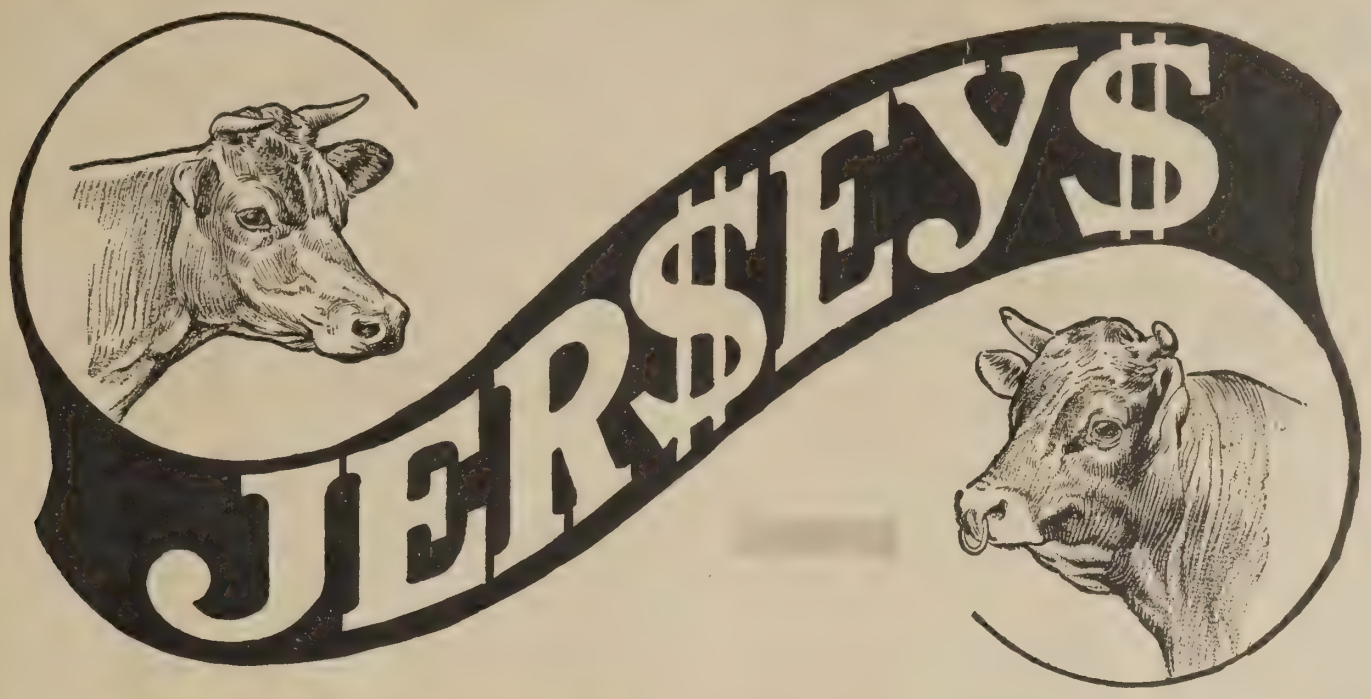
Pounds of feed required to produce a pound of butterfat:

First, JERSEYS, 12 lbs. Third breed . . 15.52 lbs.
Second breed . . . 14.83 lbs. Fourth breed . 16.91 lbs.

Figures taken from Official Report.

Chicago Test—1893

"Jerseys demonstrated ability to return a greater *net* profit than any other breed."



Statement in Official Bulletin.

Here is Your Answer!

JEREY

Lead the World in Butterfat

AMERICAN JERSEY CATTLE CLUB, 351 W. 23rd St., New York City

Hiresdale Jersey Herd

Majestys

Crocus' Jolly Majesty.

Our herd bull is a son of Sultana's Golden Jolly, the Grand Champion at the National Dairy Show in 1911, out of Majesty's Brown Crocus, third highest testing daughter of Imp. Oxford Majesty. R. of M. record 743 lbs. 85 per cent butter at 4 years of age. A combination of show ring type and production backed by careful breeding operations all through.

We are offering a few bulls and a limited number of heifers out of this wonderful line of breeding. This is your opportunity to get the blood of Oxford Majesty, Gamboge Knight, Oxford Lad and many other leaders into your herd. Write at once for pedigrees and prices.

CHARLES R. HIRES

R. R. No. 2, **Salem, New Jersey.**

Hiresdale Herd is New Jersey's leading butterfat herd. Led Salem County Cow Testing Association for 1917. Twenty-four cows now on Register of Merit test.

OK JERSEYS

JERSEYS are the "O.K." breed for the working farmer. They are bred to make money for the owners. Feed in the manger is gold in the milk pail if it goes through a Jersey. There is no other breed that produces so much for so little as the Jersey. Beautiful as a picture, hardy in all climates a genuine satisfaction and continuous source of income. Ask Breeders for pedigrees and prices and let us send you some revelation facts about the money making Jersey.

The American Jersey Cattle Club, 351 West 23rd Street, New York City

Moreton Fields Farm

Crystal Bay, Minn.

We have a small herd of fifteen to twenty cows, mostly island breeding, and they are all in the Register of Merit with very creditable records, or are now on official test.

We have a few young bulls for sale out of cows with very good register of Merit Records, and sired by Oxford Gipsy's Lad, a son of Oxford Majesty's Gipsy, Grand Champion Cow at the National Dairy Show, 1917.

IF YOU WANT TO

Increase Production

Improve Type, Size, Constitution and Prepotency.

COME TO THE NATIONAL DAIRY SHOW

Columbus, Ohio, Oct. 10th to 19th, 1918

We will have on exhibition Twenty Jersey Bulls and Bull Calves (all for sale) Rich in the Blood of the World's Champion Sires and World's Champion Cows.

Pogis 99th of Hood Farm
At 8 years of age sire of 54, and two producing sons; five daughters average 14,344 lbs. milk, 828.09 lbs. fat, 1,035.1 lbs. butter at age of four years two months. Sire of the world's Jersey champion junior 4-year-old, Sophie's Adora, 15,852 lbs. milk, 1,110 lbs. butter. He is the greatest living sire. Son of the world's champion, Sophie 19th of Hood Farm, seven years' tests 91,869 lbs. milk, 6,600.8 lbs. butter.

Hood Farm Torono
Sire of 72, and 21 producing sons; five daughters average 16,095 lbs. milk, 868.7 lbs. fat, 1,085.9 lbs. butter, at age of 5 yrs. 3 mos. Sire of more gold medal winners for production than any bull of the breed. Sire of the world's champion senior 3-year-old, Lass 66th of Hood Farm, 17,793.7 lbs. milk, 1,138.7 lbs. butter.

Lass 66th of Hood Farm
World's champion senior 3-year-old, 17,793.7 lbs. milk, 1,138.7 lbs. butter.

Hood Farm Pogis 9th
The champion sire. Sire of more R. of M. daughters than any bull of the breed. Sire of 79, and 25 producing sons; five daughters average 13,769.8 lbs. milk, 719 lbs. fat, 898.76 lbs. butter. Double grandsire of Sophie's Agnes sold at auction for $10,099, the world's record for a Jersey cow. Son of Figgis, grand champion World's fair at St. Louis, test 19 lbs. ½ oz. butter, 7 mos. 7 days after calving.

Sophie's Adora
World's Jersey champion junior 4-year-old, 15,852 lbs. milk, 1,110 lbs. butter.

Sophia 19th of Hood Farm
World's champion Jersey cow, 17,557 lbs. 12 oz. milk, 1,248 lbs. butter. World's champion long-distance cow, 91,869 lbs. milk, 6,600.8 lbs. butter in seven years.

Lass 64th of Hood Farm, ex-champion yearling, 9,329 lbs. milk, 766.2 lbs. butter; ex-champion junior 4-year-old, 13,344.6 lbs. milk, 1,022.1 lbs. butter. Lass 74th of Hood Farm, ex-champion junior 3-year-old, 13,713 lbs. milk, 973.9 lbs. butter; Lass 73d of Hood Farm, ex-champion senior 2-year-old, 10,953 lbs. milk, 931.4 lbs. butter; Successful Queen, ex-champion junior 4-year-old, 16,389.3 lbs. milk, 1,066 lbs. butter; Sophie's Bertha, ex-champion junior 3-year-old, 14,954.2 lbs. milk, 1,036.9 lbs. butter; 3 years' tests as a 2, 3 and 4-year-old, 44,299.1 lbs. milk, 3,096.1 lbs. butter—a record unequalled.

This is an opportunity every man in need of a sire should take, see the great show and secure a high class sire on the one trip. Prices to suit the Dairyman and Breeder. Ask at our Exhibit for

J. E. Dodge, Mgr., Hood Farm, Lowell, Mass.

Meadside Farms

Meadville, Pa.

Jerseys that produce. This is the farm where Jimp, test 31 lbs. 1¾ butter, 471 lbs. milk, 7 days, made record and spent her last days, and her son was in service 11 years.

Where Eminent Jimp's Owl, owned in Washington, was raised and bred, test 803 lbs. butter, 16,937 lbs. milk.

Where Eminent's Bell of T. was raised and bred. Champion 4-year-old of Ohio.

Where Raleigh's Foxlett was raised and bred; nearly 12,000 lbs. milk, 535 lbs. butter at 1 year, 11 months old.

We have bull calves rich in this blood sired by our high producing sons of Oxford You'll Do and Gamboga Knight with little Hood breeding. Prices $100 to $200. Write us.

GRANDDAUGHTER OF NOBLE OF OAKLANDS

Sire: Trial's Noble of Oaklands whose dam made 563 lbs. fat in one year. Dam: May of Oak Grove that has a R. M. record of 334.41 lbs. fat as a 2-year-old—ave. test 6.2%. Born April 1917. Bred to an R. M. son of Eagle's Chief. Also a bull calf by the same sire from a heifer that made 594.625 lbs. fat as a jr. 2-year-old and won first at Wis. State Fair 1915. Dropped Jan. 16, '18. Guaranteed straight and right.

Oak Grove Jersey Farm, Wm. M. Knight, Eagle, Wis.

READY FOR IMMEDIATE SERVICE
A yearling son of Torono's Jacoba Lad, he a grandson of Hood Farm Torono and by a grandson of Jacoba Irene. Dam made 435 lbs. butterfat in 1 year and has never been defeated at the fairs. This is an excellent individual and guaranteed right. Write **Ed. A. McGilvea, R. 2, Box 99, Baraboo, Wisconsin.**

JERSEY BULL "Mable's Noble King, 146293" Dropped Sept. 4, 1914. Solid color. Sire—Noble Rozel 101785. Dam—Matilda's Mabel 234231—the National Dairy Show winner—who in Association work made 708 lbs. butter. Mable's Noble King was 1st prize yearling at Springfield. Guaranteed a breeder. Price, $300 F. O. B. Lake Geneva. See him or write, **G. D. GILBERT, Lake Geneva, Wisconsin.**

A few for sale.
H. C. YOUNG, 33 and O Sts., Lincoln, Neb.

MESCALERO JERSEYS

ROCHETTE'S PRINCESS 253833. NOW ON TEST—IN SIX MONTHS HAS MADE 10,554 LBS. MILK, 518 LBS. FAT

In all the history of this country there has never been such a time as now to buy breeding stock.

All Federal and State authorities tell of the present shortage and the great demand soon to come with the victorious peace which shall end the great war.

Now is the time to buy—but never before has it been of such importance to make careful selection.

You *Must Have* great production, but you also want economical production. You want size, constitution and capacity—health and vigor.

You also want correct type and true Jersey refinement and beauty.

Then why not buy from a herd where you can combine *all* these good points—and where the prices are within the reach of all.

Even now we seldom keep our bull calves any length of time and we confidently believe that within a very short time every calf will be engaged in advance.

We have today just 24 cows of milking age. Nine have already completed Register of Merit records with the splendid average of 10,733 lbs. milk and 560.3 lbs. fat.

On test now we have among others—

	Milk	Fat
Rochette's Princess—in just six months	10,554.0	518.01
Rochette's Golden Princess, 9 mos. 2 days	12,505.7	614.5
Lady Rosette of H. S. F., 8 mos. 18 days	12,941.7	614.8
Rowers June Lady, 4 mos. 15 days	5,298.9	235.5
Eminent's Handsome Fern, 3 mos. 25 days	3,219.3	197.4

Every cow in this herd will be put on test within the next year. This should prove conclusively our claim of production.

As to correct type, conformation and beauty. We have only shown twice—both times at the New Mexico State Fair, where we were first in every class entered, and, in competition with Holsteins and Guernseys as well, won every grand championship.

The majority of our cows were imported from the Island of Jersey by W. R. Spann, and we gladly refer to him as to their quality.

OUR HERD BULLS—One a son of Gamboge's Knight, out of a Register of Merit Flying Fox cow. His first daughter tested has just completed a year's Register of Merit work, and although less than two years old at start, has made the following record: Milk, 8,397.4 lbs.; Fat, 491.2 lbs.

The younger bull is a son of *Sybil's Gamboge*, dam a Register of Merit daughter of Oxford Majesty. This bull imported by Edmond Butler. You know what he thinks of Sybil's Gamboge blood and you know how they sold last spring.

Our test cows are handled in a perfectly normal manner. They are milked and fed three times a day—other than this they have no special care, and run in open lots with the other cows, both summer and winter.

Health, Constitution and Vigor

Our cows and calves are out of doors just 365 days in each year. Dry air and cool nights in summer, bright sunny days and cold nights in winter; pea green alfalfa with oats and corn insure health, size and great capacity.

If you want pretty little playthings, don't come to this herd, but if your aim is large, economical production, with health and beauty added, and want it at worth the money prices, it will pay you to write us.

Meldrum Gray, Roswell, New Mexico.

Roycroft Northern Grown EFFICIENCY JERSEYS

The following description of THE KING OF CLOVERLAND and OGIMA OF CLOVERLAND, the two Herd Bulls in use on Roycroft Farm, is for reference only. The list of young bulls following the herd bulls are descriptions of the ones we offer for sale and the prices named are for the animals registered, transferred, crated and shipping charges prepaid to the purchaser's nearest express station.

THE KING OF CLOVERLAND 115137 is out of Eminent's Bess and sired by Jacoba's Emanon. Eminent's Bess is entered in the Register of Merit with 18,782 lbs. 15 oz. of milk equal to 1,132 lbs. 12 oz. of 85% butter. Jacoba's Emanon is a bred-and-tested for production bull whose first ten daughters to complete a year's work qualified for the Register of Merit at an average age of 2 years 4 months at beginning of test and produced a total of 63,527 lbs. of milk testing 6.43% in fat—an average of 480 lbs. of 85% butter per cow with first calf. Jacoba's Emanon is a grandson of Jacoba Irene who is entered in the Register of Merit with 17,253 lbs. 4 oz. of milk testing 1,122 lbs. 2 oz. of 85% butter in one year. To put it more concisely 62½% of the blood of the King of Cloverland comes from two cows with authenticated records of 36,035 lbs. of milk testing 2,253 lbs. of 85% butter in one year. **The King of Cloverland is the only Jersey bull in the world whose close up ancestry shows two cows with authenticated records of over 1100 lbs. of 85 per cent butter in one year, and Eminent's Bess is the only Jersey cow in the world that has an authenticated record of having produced an average of 51 lbs. 7 oz. of milk testing over 5 per cent in butterfat every day for three hundred and sixty-five consecutive days—a persistency of milk production that is a most desirable characteristic in the dam of a herd bull.**

OGIMA OF CLOVERLAND 153900 is out of My Rosebud's Pride and sired by the King of Cloverland. My Rosebud's Pride is entered in the Register of Merit with 15,414 lbs. 3 oz. of milk equal to 971 lbs. 10 oz. of 85% butter. Soon after completing this record she was well started on a year's work that gave every promise of smashing all records for the Jersey breed when an accident to her udder put her out of commission. The sire of My Rosebud's Pride is Rosebud's Fern Lad who has seven daughters entered in the Register of Merit at an average age of 4 years 8 months at beginning of test and with an average production of 11,427 lbs. of milk and 716 lbs. of 85% butter in one year. Ogima's pedigree shows that 81¼% of his blood comes from three cows entered in the Register of Merit with 51,450 lbs. of milk equal to 3,226 lbs. of 85% butter. **Ogima is the only Jersey bull in the world whose close up ancestry shows three cows with authenticated records averaging 17,150 lbs. of milk and 1075 lbs. of 85 per cent butter in one year.**

BULLS FOR SALE

Bull No. 156 (Tattoo No. 23.) Price $600

Born May 3, 1918. Light tongue and switch. Broken color with some white. Out of Edith Marigold and by OGIMA OF CLOVERLAND. Edith Marigold is a gold medal cow entered in the Register of Merit with 11,842 lbs. of milk testing 819 lbs. 6 oz. of 85% butter, the test beginning when she was 4 years 6 months of age. Her sire has six daughters entered in the Register of Merit with an average of 526 lbs. of 85% butter in one year with first calves. The broken color of this youngster out of Edith Marigold indicates that he throws back to his sire's dam, My Rosebud's Pride, who is a cow with some white and it ought to be good reasoning to say if he inherits color from his grandmother that it is equally likely he inherits the ability to transmit her milk producing qualities. With three near up ancestors whose authenticated year records aggregate 46,038 lbs. of milk testing 2,922 lbs. of butter, this young bull has every license to be a sire of high producing cows. He also has an aristocratic carriage quite in keeping with his wonderful milk producing ancestry and he has all the points that go to make a show ring winner.

Bull No. 158 (Tattoo No. 25.) Price $450

Born July 21, 1918. Solid color, black tongue and switch. Out of Marion's Pride and by THE KING OF CLOVERLAND. Marion's Pride is entered in the Register of Merit with 10,080 lbs. 11 oz. milk testing 684 lbs. of 85% butter, the test beginning when she was 9 years 2 months of age. She is now over 15 years of age and is milking from thirty-eight to thirty-nine pounds per day on grass. She is as young at fifteen as most cows are at nine or ten and the fact that she is a regular breeder at her age speaks much for the longevity of her progeny.

Bull No. 162 (Tattoo No. 28.) Price $500

Born August 28, 1918. Solid color, black tongue and switch. Out of Salome of Roycroft and by THE KING OF CLOVERLAND. Salome is entered in the Register of Merit with 12,525 lbs. of milk testing 728 lbs. 12 oz. butter and was 4 years 9 months of age at beginning of test. She could easily go over the eight hundred pound mark on present lactation if good feed stuffs and good milkers were available. Salome is by same sire as Edith Marigold.

Bull No. 163 (Tattoo No. 29.) Price $400

Born August 29, 1918. Broken color, light tongue and switch. Out of Cyrene of Roycroft and by OGIMA OF CLOVERLAND. Cyrene is entered in the Register of Merit with 9,314 lbs. 9 oz. milk testing 611 lbs. 7 oz. butter and she was 3 years 2 months of age at beginning of test. Cyrene is a large cow weighing over 1,200 lbs. and could easily qualify for the eight hundred pound class on this lactation period if conditions were normal and good feed stuffs and milkers available. The same argument applies regarding the broken color of this young bull as applies to bull No. 156.

Roycroft Farm is 1,300 feet above the sea level and in latitude 46 degrees north just midway between the Equator and North Pole. We believe that our hardy Northern Grown Jerseys will do the business farmers and breeders of more Southern latitudes much good. Bear in mind that a bull is known by the owner he keeps.

Many Register of Merit Cows and Their Offspring

This Breeding and Dairy Farm, founded 1878, has done more to develop and encourage Dairy Farming than any other farm in America.

A. J. Glover, Editor Hoard's Dairyman, said he knew of nothing so reliably indicating the capacity of dairy cows as the Cow-Test Association Records.

Four consecutive years Winona Association held the highest average record of any Association in the World.

1896 L. P. Bailey and Sons sold Winona folks 42 registered and about as many grade Jerseys—the foundation of the great Dairy Interest in Columbiana County, Ohio.

1917-18 Barnesville Association shows an average of 369.25 lbs. 85 per cent butter, passing Winona and all others—a word to the wise.

This is a consignment of our average stock and will prove as good as that we have been selling for forty years.

Our present leading herds' bulls are: Fanny's Oxford Majesty 91781 Imp. in dam, Bess' Oxford Owl 105830, Imp. Glory's Noble 90655, Oxford Direct 125979, and Oxford Fontaine Lad 102683. Note the prominence of the Oxford Lad, different strains. Send for catalog.

Address L. P. Bailey and Sons,

Tacoma, Belmont Co., Ohio

Col. Perry, Auctioneer.

Sophie's Tormentor JERSEYS

"Production" our Watchword.

FOR SALE—BULL CALF No. 257, dropped May 22, 1918; solid color, black tongue and switch; an excellent individual.
SIRE: Lou's Torono 106614, whose first four daughters on test averaged 602.71 lbs. butter 85% fat, from 9,450.9 lbs. milk, at 1 yr. 11 mos. of age; all four finished in Class AA, having carried calf an average of 183 days.
DAM: Varna 333660, in the R. O. M., Class AA—546.29 lbs. 85% butter in 1 year from 8,160.3 lbs. milk, at 2 yrs. 3 mos. old. A daughter of the famous Hood Farm Torono 35th 99265. **FAIRVIEW FARMS, Inc.**

Minnesota Dairy Short Courses

The Minnesota College of Agriculture announces the following special short courses in dairying to be given during the coming winter season:

Creamery buttermakers, December 2—14; cheesemakers, December 2—21; ice cream makers, December 16—21; dairy course, January 6—March 1; and creamery managers' conference, January 2—3.

The 1918 food reserve is the only safe insurance for 1919 food supplies.

50 PURE-BRED HOLSTEINS 50

QUACKENBUSH for QUALITY HOLSTEINS

My Herd Sire, RAG APPLE PONTIAC is a bull of high class breeding. He is half brother to the famous $25,000 sire, *Rag Apple Korndyke 8th,* the sire of the $53,200 bull calf, the World's Champion 42-lb. 3½-year-old and the youngest 30-lb. heifer. He derives 43¾% of his blood from the noted Century sire, *Pontiac Korndyke,* the sire of the World's Champion 30-day butter producer and who has more 30, 36, and 40-lb. daughters and 1,000-lb. year-record granddaughters than any other bull. He is a grandson of the only double century sire, *King of the Pontiacs,* who has more 40, 30, and 20-lb. daughters than any other bull. He won first prize at the La Crosse, Wis., Fair this year and a daughter of his won first at the Wisconsin State Fair.

BOTH MALES AND FEMALES FOR SALE

Females of all ages. Some are springers and some are bred to the above sire. Some of the cows have A. R. O. records up to 27 lbs. in 7 days.

This stock is of the most popular breeding, such as Korndyke, Pontiac, Hengerveld DeKol, King Segis, Polkadot.

Bull Calves at a Bargain; ages from 1 week to 7 months. Sired by *Sir Pontiac Wayne DeKol 3rd,* a grandson of *Sarcastic Lad,* the sire that won Championship at the World's Fair—and by *King Segis Pontiac Polkadot 8th,* a grandson of *King Segis Pontiac* and *Johanna McKinley Segis.*

Write at once or come and see me. W. W. QUACKENBUSH, West Salem, Wisconsin.

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam is a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a finer combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.

We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.

This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Susquehanna Farms, Hartwick Seminary, N. Y.

Springdale Farms
Grade Holsteins

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Lakeside Herd

Best Bulls For the Money

State about amount to be invested, with quality required. I will describe the best for the amount. Large number of females to select from, all ages. Highest individuality, large production, best type, best udders are characteristics of Lakeside Herd. E. A. POWELL, Syracuse, N. Y.

"NO HORNS"

Naturally Polled Holstein-Friesian bull calves, sired by a son of the World's Record senior 4-yr.-old, 1294.7 lbs. butter in 365 days, at $100 and up. Descriptive catalogue for stamp.

GEO. E. STEVENSON & SONS, Clarks Summit, Pa.

When writing advertisers please mention Hoard's Dairyman.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

The E. C. Schroeder Farms, Box 576-H, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

Young Bulls From Seven-Day and Yearly Record Dams

Dams of all bulls have official records of from 15 to 25 pounds of butter. All are now on yearly semi-official test and will complete records this fall and winter. Nearly every cow has completed cow testing records for three years and has produced up to 600 pounds of butter. These cows are never pushed to the limit. The bulls offered are sired by bulls secured from the E. C. Schroeder and other noted herds. Sires' dams have records up to 950 pounds of butter. Bulls are heavy bone, straight, well marked and large for their age. They will and must please. We guarantee satisfaction.

A 37.60 bull, son of the great King Korndyke Sadie Vale, we also have some others. Send for pedigree and price list.
Tamarack & Hollyhock Farms, Dousman, Wis.
Gustave Pabst, Prop., F. J. Southcott, Mgr.

CARNATION ORMSBY PET

heads my herd. He is a son of Johanna McKinley Segis, A. R. O. daughters, and from Beauty Pietertje Ormsby Pet, a 24-lb. 2-year-old daughter of Beauty Pietertje Prince, 26 A. R. O. daughters including a 30-lb. 4-year-old. J. C. WILTON, EAGLE, WIS.

Bonair Farm Holsteins

Sir Korndyke Fytje Pietertje 132719

The Only Bull whose sire, dam and full brother have all been first prize winners at any National Dairy Show heads our herd. His sons up to 6 mos. out of cows up to 26.76 lbs. for sale.
C. J. Will, Prop. Menomonee Falls, Wis.

Ready For Light Service

Bark River Stock Farms offer for sale two two-year-old heifers sired by Count Johanna McKinley, he a son of Johanna McKinley Segis. Write
CONNELL BROS., COLGATE, WIS.

For Sale—Several Young Bulls

5 to 8 months old. Sired by a 30-lb. son of Rag Apple Korndyke, some are from A. R. O. dams and priced very reasonable. Wm. F. Mielenz, 312 First National Bank Bldg., Milwaukee, Wis.

RIVERVALE FARM

Offers cows and heifers with good A. R. O. breeding at reasonable prices.
GEO. H. GIBSON, Nashotah, Wisconsin.

CHAS. BURBACH,
Waukesha, Wis.

We Have Several Bulls Six Months Old

out of good record cows and sired by 30-lb. bulls. Also have two small calves sired by our 40-lb. bull. Write us about them. Aitken Bros., Waukesha, Wis.

SIR PIETERTJE ORMSBY MERCEDES 43rd heads our herd. Write us for a price on one of his good sons from an excellent A. R. O. dam.
M. E. GUNDERSON & SONS
Route 25, - - - Oconomowoc, Wis.

BULLS IN SERVICE

Wooderoft Perfection No. 199441, who has a 40-lb. dam made from over 700 lbs. milk and over 1000 lbs. butter in one year, average for 2 nearest dams 38 lbs. Pabst Blackberry Korn. No. 186830. Dam's record, 31 lbs. at 3½ yrs. sired by a 28-lb. bull Maplecrest King DeKol 2nd. A 26-lb. grandson of King Pontiac Champion. Young bulls for sale. Dam's record 16 lbs. at 23 mos. to 31 lbs.
Muckleston, Howell & Schwartz, Waukesha, Wis.

We Offer a Son of Pabst Pontiac Champion No. 105106

from a granddaughter of Homestead Jr. DeKol. Ready for service. Faultless individual. Priced to sell quick. Dam has good 7-day and yearly record as a 4-year-old. She has 1 A. R. O. Son and 2 A. R. O. daughters.
S. A. BAIRD & SON, Waukesha, Wis.

KING SUPERBA

King Superba's Dam is the great Milanhurst America De Kol, World's Record 4-year-old, with 1231 lbs. butter in 365 days, and 28 lbs. butter nine months after calving. Eight of her records have never been equaled in all respects by any other cow. Come and see his sons and daughters at the Wisconsin State Fair, Sept. 9th to 14th. (See W. J. Mann & Sons ad.)
BAIRD BROTHERS, Waukesha, Wis.

FINE BULL CALF

We offer a bull calf born Nov. 19th, 1917. A very fine, straight, growthy individual ¾ white; dam has 7-day A. R. O. of 24.6 lbs. butter and 567 lbs. milk. He is by a sire whose two nearest dams average 22.3 lbs. butter and 520 lbs. milk at 3 years. Price $125.00 if taken at once.
Miller Bros., R. No. 25, Oconomowoc, Wis.

RUST BROS., WEST ALLIS

Size, good individuality and large 7-day and semi-official yearly records are the points for which our herd is noted. The following are two of our records: Aaltje Salo Netherland Pontiac has 33.3 lbs. in 7 days and 134.8 lbs. in 30 da. Ida Lotta 5th 29.74 lbs. in 7 days at 4½ yrs., 27.12 lbs. in 7 days and 816.9 in 365 days at three yrs. We now have a couple serviceable young bulls from A. R. O. dams for sale.
RUST BROTHERS, West Allis, Wis.

GRAMLING BROS.
Dousman, Wis.

KING SUPERBA
Meet his sons and daughters on exhibition in the Waukesha County Live Stock Exhibit, at the Wisconsin State Fair. Combine individuality with production. For Sale—Sons of King out of our best cows. (See Baird Bros. ad.)
W. J. Mann & Sons, R.2, B.16, Waukesha, Wis.

MORE MILK—MORE MONEY

Get a grandson of this great cow, Milanhurst America DeKol, 143441, that produced an 8-gallon can and a ½ of milk per day equal to 13 tons, or more than her own weight each month for a whole year. If her milk was sold at 10c a quart her years production would amount to $1,300. A few choice bulls for sale, some of breeding age.
Dr. David Roberts Stock Farm, Waukesha, Wis.

BELLEVIEW STOCK FARM
Breeds the big, high producing kind. We are now offering for sale a few good sons and daughters of Aaltje Salo Johanna Pontiac 57169.
E. B. WATROUS, - Troy Center, Wis.

We Offer Three Young Bulls

4 mos. of age sired by Sir Pietertje Ormsby Mercedes 43d whose dam and sire are among the greatest of the breed. They are out of high producing A. R. O. dams. Send for photo and pedigree. Herd on U. S. Accredited List. We will price these bulls cheap because they are young. A good chance for your next year's sire.

Holstein Bull Calves

One 27-lb. dam at 3 years 4 mos. King of the Pontiacs, Hengerveld De Kol and Johanna breeding. 19 years breeding and selecting a producing herd. Write or better come and see. M. F. Peck & Sons, Marshall, Wis.

You Can't Afford to Overlook This Young Bull

Canary Ormsby Johanna De Kol 256894.

A SON OF THIS THREE-YEAR-OLD FOR SALE.

Canary Ormsby Johanna DeKol produced 28.18 lbs. butter, 503 lbs. milk in 7 days and 111.95 lbs. butter, 2,318.6 lbs. milk in 30 days at the age of 3 years, 1 month, 6 days. Her sire, Canary Fobes Bessie Homestead (20 A. R. O. daughters), is a 31-lb. grandson of Canary Paul and Homestead Jr. DeKol. Her dam is a 17-lb. 2-year-old daughter of Sir Ormsby Johanna DeKol (31 A. R. O. daughters, 2 above 30 lbs.). Every dam in her 4-generation pedigree has a good A. R. O. record.

The Sire of This Young Bull is Mutual Fobes Longfield DeKol 82959, a son of Mooie Mutual DeKol and from a daughter of Homestead Jr. DeKol that, as a Jr. 3-yr.-old, made 30.04 lbs. butter, 630.8 lbs. milk in 7 days and 124.42 lbs. butter, 2,651.6 lbs. milk in 30 days.

This youngster is well marked and as straight as they make them; so are his sire and dam. Moreover, he's a descendant of proven producers from one end of his pedigree to the other. His dam's record as a 3-yr.-old is bound to be increased. There's no question but that he'll prove to be a top notch herd sire. He was born April 10, '18. Write us about him today, for he won't be here long.

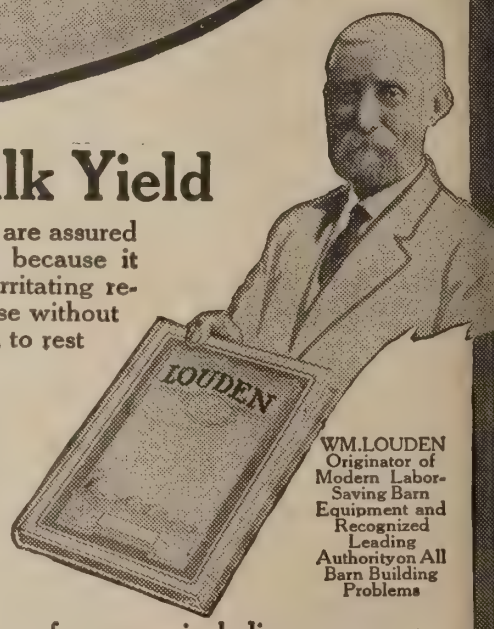
MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

A Bull That Will Suit You

He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, and whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna De Kol. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show cow,—took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is backed by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been looking for. Other young bulls by the same sire and from A. R. O. dams for sale. Write
WAYSIDE STOCK FARMS, A. L. Williams, Est., O. A. Williams, Exec. Fond du Lac, Wisconsin.

LOUDEN

Barn Equipment 50 Years Standard



Keep Cows Comfortable—Increase Milk Yield

Milk quantity depends on cow health and comfort. Milk prices depend on cleanliness and quality of the milk. Both depend on a clean, light, airy, sanitary barn, such as Louden Steel Stalls and Stanchions enable you to maintain at minimum labor expense.

Pasture comfort and safety for cows are assured with the Louden Swinging Stanchion, because it gives cows the greatest freedom from irritating restraint—permits them to lie down or rise without dangerous straining, to card their sides, to rest comfortably at night.

Louden Stalls and Stanchions are chosen by practical men who investigate—because of their feed saving manger curb, their plain, smooth, simple, strong construction, freedom from sharp corners that injure cows, from useless attachments that prove troublesome, from cracks and crevices that gather dirt.

Built of tubular steel, firmly anchored, and held together by heavy continuous top rail, Louden Stalls stand severe shocks and strains—do not get wobbly—outlast the barn.

WM. LOUDEN
Originator of Modern Labor-Saving Barn Equipment and Recognized Leading Authority on All Barn Building Problems

Easily Installed in Any Barn—Old or New

It is not necessary to change the style or size of your barn to avail yourself of Louden Equipment; and you can install it yourself—no expert needed. If you have but a small general purpose barn, of five, ten or fifteen cows, you will find Louden Stalls and Stanchions proportionately as profitable as they have proved themselves to be in the thousands of big dairy barns where they have been in use for years—including many government barns in the United States and foreign countries.

You will find that they enable you to handle more cows with less labor and that the greater comfort and safety, better health and increased milk yield of your herd, together with the feed saved, pays for the equipment every year.

Write for Our 224-Page Illustrated Catalog

It shows many styles of Louden Stalls and Stanchions and you will find the cost moderate. It also gives full information on all Louden Labor Saving Barn Equipment which has been the recognized standard for over half a century. Sent postpaid without charge or obligations. The coupon or a post card brings it to you.

The Louden Line Includes:
Steel Stalls and Stanchions
Litter and Feed Carriers
Animal Pens of All Kinds
Mangers and Manger Divisions
Hay Unloading Tools
Power Hoists
Sanitary Water Bowls
Barn and Garage Door Hangers
Ventilators and Cupolas
Horse Barn Fittings
"Everything for the Barn"

We would like to send you also "Louden Barn Plans," a 112 page book devoted entirely to barn building. Shows 74 illustrations of barns and other farm buildings, with estimated cost of each. Every phase of barn building discussed and illustrated. No charge, sent postpaid on request. Write for it.

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Ayrshire Advanced Registry

Ayrshire Advanced Registry records for the quarter ending Sept. 15, 1918, show a total of 74 mature and immature completed yearly records averaging 10,124 lbs. milk, 407.88 lbs. fat with an average test of 4.03%.

The following is the class data:

Class	No. entries	Averages Milk Lbs.	Fat Lbs.	Fat %
Mature	28	11,574	459.33	3.97
Senior 4-year	4	10,418	440.89	4.23
Junior 4-year	4	10,688	420.03	3.93
Senior 3-year	8	8,891	374.66	4.21
Junior 3-year	5	9,032	368.87	4.08
Senior 2-year	13	9,493	386.09	4.06
Junior 2-year	12	8,415	334.81	3.98

A new class leader appears in the senior two-year-old class in Ryanogue Lady Peggy. Starting on test at the age of 2 years, 214 days, in 333 days she produced 14,017 lbs. milk, 575.86 lbs. fat, testing 4.11%. She carried her calf 252 days of test. So far she leads the Roll of Honor Class and stands sixth among the senior two-year-olds of the breed in the A. R. Class. Ryanogue Lady Peggy was bred by Ryanogue Farms, New York, and is owned and tested by Wendover Farms, New Jersey. During her test period she was shipped to and exhibited at the 1917 National Dairy Show, placing in her class. On September 14th she dropped a splendid heifer calf sired by the champion bull, Imported Howie's Mintmaster, and starts out with great promise of making another creditable record.

L. R. Grow of New York has completed his first Ayrshire Advanced Registry record, his cow, Gusta Lessnessock, not only making a record of 15,661 lbs. milk, 563.6 lbs. fat, but leading the junior four-year-old class for the quarter just ended and standing fifth among the junior four-year-olds of the breed.

Vermont. J. G. WATSON.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The New Spirit

There is a new way on the farm;
A new thrill sweetens all the air.
New strength has come to every arm—
New vigor stirring everywhere.
We're doing twice as much, I guess;
The herd has even caught the spell.
And once—so satisfied with less—
We thought we managed rather well.

War spurs us on to greater deeds;
To greater dividends of toil.
We sense the busy nation's needs,
And coax rich harvests from the soil.
From house to barn, this feeling goes—
This new-born energy and zeal.
And, somehow, at day's close, it shows,
The proof of what we do is real.

What pride surrounds each humble clod;
What glory, in the waving grain.
Farms reach a little nearer God
Than they can ever rise again.
This is the humble hour of them all—
Sublime—resplendent—paramount.
And we have answered to the call—
We're doing things that count—that count.

Little Ellen had been watching an old fashioned churn for nearly an hour. Finally she went to her mother with the observation: "Of course butter is nice and I like it on bread but I had no idea, mama, that you had to mistreat milk so to get it."

Half the profits of the Kentucky State Fair will be put straight into War Savings Stamps. Kaintuck always did have fine hosses, women, and patriotism.

It would be a lot easier to raise more hawgs and help Mister Hoover out if th' wind wasn't so contrary in blowing into yer own windows.

Letters Home

Dear Mother and Father: I don't mind fighting as much as I thought I would. But I do miss the farm. It's been so long since I've seen a glass of real old fashioned buttermilk, that if you brought me one I wouldn't know what to do with it. One of the boys found a female goat on an abandoned French farm not far from here and fed her up and milked her every evening when we wasn't fighting. He sold it fer twenty-five cents a glass and we stood in line to get it. But last Thursday a Boche shell blew his dairy about a mile away.

"I see where us Americans saved 140,000,000 bushels of wheat last season just to help feed our allies," said Uncle Ezra, "and, even at that, we didn't miss on any of our cylinders when it came to meal time. Most of us eat so much more than we need, that we could cut it in half and still have enough left over to give away."

He Said Them in His Sleep

A dairy farm Sammie, while snoozing in his billet, was heard to speak thusly:

"That calf has her feet tangled in th' rope."

"Pass th' butter, ma."

"Let's take a snooze under these old apple trees."

"Time we put up one of them nice new silos."

"Best crops we've ever had this year."

"Can't bear to see you feed them hogs skimmilk."

"Ain't it about time we had pork pie?"

"I'll blast th' stumps if you'll do th' weeding."

"Tell Susie I'll meet her at th' movies."

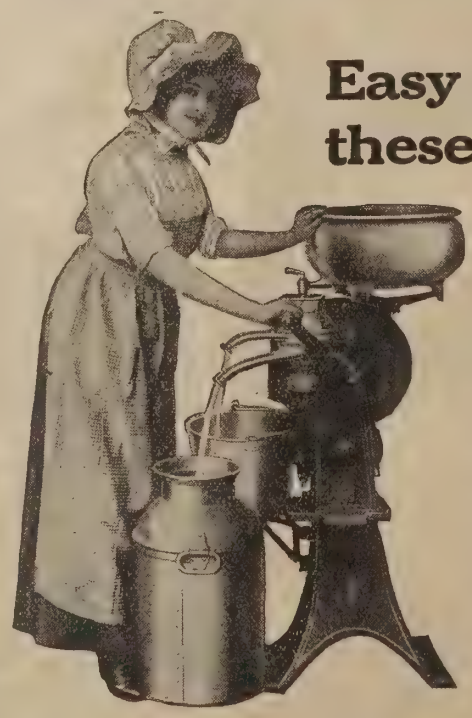
"Let's go in swimmin' this afternoon."

DE LAVAL SEPARATORS

SAVE IN 7 WAYS

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.



LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST since while a De Laval Cream Separator may cost a little more than a poor one to begin with, it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION which is no small consideration, and can only come from knowing you have the best separator, and being sure you are at all times accomplishing the best possible results.

Easy to prove these savings

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency write the nearest De Laval office, as below.

Re-testing Cattle for Tuberculosis

Questions Concerning State Regulations Answered by Dr. S. H. Ward, Hon. C. P. Norgord, Dr. J. A. Kiernan, and Dr. J. F. DeVine.

ALL cattle coming into the state of Virginia for dairy or breeding rposes, male or female, six months and over, must be accompanied by written certificate showing that said ttle have passed the tuberculin test t longer than four months before tering the state. Said test must ve been conducted by a qualified terinarian and approved by the live ock quarantine authority or state terinarian of the state from which id cattle originate, or by the United ates Bureau of Animal Industry. is certificate must be presented to d approved by the state veterinian of Virginia before said cattle all be allowed to enter the state."

"Upon arrival at their destination ey shall be held in quarantine upon e owner's premises subject to a re-t for tuberculosis not earlier than ty days nor later than ninety days om the date of arrival. This quartine is automatic upon arrival of id cattle at the destination."

A Virginian dairyman quotes the w or regulation of his state as given ove, and then submits the following estions:

"If the test made before being adtted into the state is good, why is e retest immediately following necsary or of any value?

"If the original test is not worth ything, why should it be required?

"Is it not detrimental to make such equent tuberculin tests of dairy cat-?

"Do you consider th of these requirents will promote the e stock and dairy inrest of the state, or scourage same?

"Will the requirent of the two tests time specified pro-te the interest of ybody; if so, who?

"Do you consider is law wise, or one at should be realed?

"To buy dairy cows out of the state at have been tuberculin tested costs out $10 per head, besides delay and her expense, more than those that ve not been tested. Why is this cessary if they have to be retested?

"I am both financially and as a citin interested in the promotion of the alth and progress of the live stock d dairy interest of the state, and n asking these questions for inortion, realizing your knowledge, d will appreciate a full and prompt ply."

To these questions we have given e following reply:

The requirements of the state of rginia are not unusual and have en made necessary because of e unfair manipulation of the test ich has occasionally occurred. The est acts as an additional precaution keeping the herds of the state free om this disease. We can cite one stance which occurred not long ago d which illustrates this point:

A certain wealthy man became interested in dairy cattle and he purased $47,000 worth of animals om one particular breeder paying 5,000 for a herd sire. He lately beme interested in placing his herd on the federal accredited list and und that under their regulations he uld be required to have a retest ide at his farm. This was fully satfactory to him but the breeder of om he purchased heard of this arngement and immediately informed m that if a retest was to be made he would insist that the cattle be returned to him. There is no evidence that these cattle were tuberculous, in fact they came with proper certificates showing that they had been properly tuberculin tested. However, reactors had been found in this breeder's herd and it is not unreasonable to suppose that he was afraid to have a retest made, fearing that with these high priced animals publicity would be given which would be very harmful to his business.

By requiring the retest the buyer in Virginia is protected against men who might otherwise attempt to issue fraudulent test sheets. Knowing that these animals are to be retested they will be more careful to see that their work is accurately and honestly done. Now, dishonesty in the application of the tuberculin test is not so extensive as some people think, but in cattle breeding, as in every other circle, there are some dishonest men and the purpose of the law is to either keep these men from being dishonest or to put them out of business if they attempt it. The retest also affords protection against animals in the incubative stages, animals that may have been exposed or that come from badly diseased herds, and animals which have been carelessly tested or tested under improper circumstances.

Of course, one might say that this same result would be effected if the cattle were not tested in the first place, but this would not necessarily follow. In some cases breeders will not only sell cattle subject to the tuberculin test but will also sell cattle subject to a retest made within ninety days provided the animals have been properly quarantined.

The frequent tests are not detrimental to the cattle and we are inclined to believe that the requirements of the law are in the main good. We hope to see the day come when a larger number of herds will be upon the federal and state co-operative accredited list; that is, that more herds will be tested yearly and have the certificate of the government that the herd is free of tuberculosis. Animals from herds of this character are accepted by practically every state without requiring a test just prior to shipment or requiring a retest upon entry into the state.

Dr. S. H. Ward of Minnesota

After sending the above reply, we referred the inquiry to Dr. S. H. Ward, secretary of the Minnesota Live Stock Sanitary Board. He replies to the various questions in order as follows:

No. 1. "If the test before being admitted into the state is good, why is a retest immediately following necessary or of any value?"

Because animal may have been in the incubative stage of the disease at the time test was made for export.

Again, because inferior tuberculin may have been used or the test not properly carried out.

Again, owner may have taken some steps to defeat the results of the export test.

No. 2. "If the original test is not worth anything why should it be required?"

Because we have no means of knowing the worth of the original test.

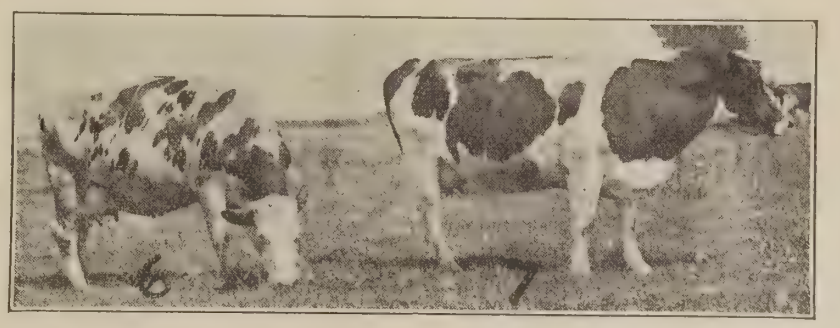
No. 3. "Is it not detrimental to make such frequent tuberculin tests of dairy cattle?"

The retest in sixty or ninety days should not be detrimental.

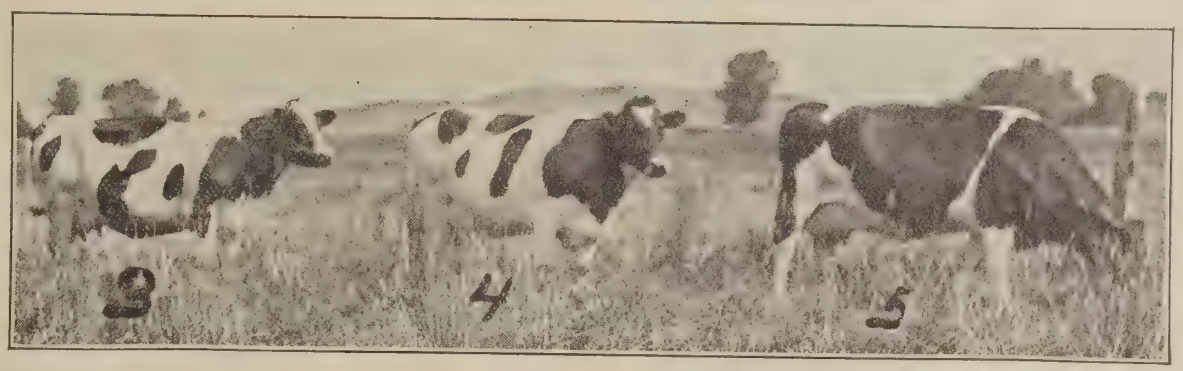
No. 4. "Do you consider both of these requirements will promote the live stock and dairy interests of the state, or discourage same?"

It will be to protect the buyer and prevent the introduction of diseased animals, thus encouraging the live stock interests.

No. 5. "Will the requirement of the two tests in the time specified promote the interests of anybody? If so, who?"



Second test usually conducted by the state, free of charge, therefore cannot be to the interests of any one but buyer.



No. 6. "Do you consider this law wise or one that should be repealed?"

I consider it wise because it will encourage the establishing of accredited tuberculosis free herds from which cattle can be moved without restrictions. Virginia in its recent regulation permits the entry of such cattle without restrictions. Breeders who maintain accredited herds will meet with none of the vexatious delays and expense when shipping to another state. It is to their interest to be listed as early as possible.

No. 7. "To buy dairy cows out of the state that have been tuberculin tested costs about $10.00 per head, besides delay and other expense, more than those that have not been tested. Why is this necessary if they have to be retested?"

Because there is still an opportunity for fraudulent certificates of shipments of diseased animals similar to those which were made two or three years ago from the state of Illinois.

HIGH PRODUCING HOLSTEIN COWS OWNED BY DONLEY & SIMPSON, COLORADO

They are tested each month in the Tri-County Testing Association in Denver, Jefferson, and Adams Counties, and have lead the cows of the association herds in production. The records of these seven cows are a challenge to every other testing association in the country. From left to right they are: (1) Ismay Belle DeKol. During her three last lactations she has milked over 60,000 lbs. and in July, 8 months after calving, made a 7-day butterfat production of 20.48 lbs. She was being milked but twice per day up to 5 days before the test began. (2) Colette Baker 4th has produced over 43,000 lbs. milk in less than 21 months. She has a 7-day record of 701 lbs. milk, 22.24 lbs. butterfat. (3) Peggy Mercedes Paul made 89 lbs. fat in May, 101 lbs. fat in June, and 75 lbs. fat in July, milked twice per day the last month. (4) Launa of Windsor 2d made 97 lbs. fat in May, 67 in June, and 69 in July, the last two records being made on two milkings per day. (5) Joan DeKol Wayne made 83 lbs. of fat in June and 75 lbs. fat in July. (6) Rose Chiron DeKol freshened July 9 and during the last 17 days of the month produced 67.5 lbs. fat. (7) Oberlin Countess Pontiac 2d in June, the month she was turned dry, made 24.5 lbs. fat.

Hon. C. P. Norgord of Wisconsin

Hon. C. P. Norgord, Commissioner of Agriculture for Wisconsin, replies to these inquiries as follows:

1. The retest is made by Virginia and a number of other states because they have found that some cattle reacted shortly after arriving at destination even though they had a clean bill of health following the test immediately previous to shipment. There are several conditions which may bring the reaction at destination under such conditions:

a. A dishonest test may have been made and no doubt sometimes is made where animals have been plugged or no test given them.

b. Certain animals may have the infection in initial stages not far enough developed so that they react when the test is made but later on being subject to the adverse conditions of shipment and new conditions, the disease develops far enough so that the animal reacts.

c. An animal may have been exposed to the disease either from animals, stock cars, or yards during shipment and disease develops later and sometimes rapidly.

d. The fact is becoming increasingly well known and recognized that the testing of a single animal bought out of an untested herd and tested with others is not a safe test upon which to rely. Only animals from herds that are tested every year are really safe animals to buy. It is practically only animals of accredited herds that are safe. A number of the western states have taken similar action to Virginia but have permitted animals from accredited herds to be shipped in without any test whatever merely upon certification that they are from state

Iowa Dairy Cattle Congress

WATERLOO put on its ninth and very successful Dairy Cattle Congress Sept. 30 to Oct. 6. Seemingly it is the habit of those responsible for the show to make each one just a little better than its predecessor and this year was no exception.

There is, we believe, a very good reason why the Cattle Congress as a dairy show is increasingly successful each year. It was originally started by the Iowa State Dairy Association for the express purpose of serving as an educational show for dairymen and those engaged in allied industries. Later it was sold to the city of Waterloo, but the new management like the old, has hewed strictly to that line even to the extent of shutting out the pike, so familiar at many fairs, which while it might add very considerably to the gate receipts and concession money, would not at all increase the educational value of the show.

The machinery exhibit, including everything from small gasoline engines to tractors and cream separators to barn equipment, filled exhibition hall and extended along both sides of the roadway down to the main entrance of the grounds. The increase in this department, a very considerable one, was largely among the tractors and the daily plowing demonstration held on fields adjoining the grounds proved one of the drawing cards of the entire show.

The automobile show this year was strictly a war-time exhibit. In fact, there was no auto show,— it was entirely an exhibition of various makes and styles of trucks, something which, just at present, undoubtedly appeals to farmers more than would automobiles.

The auto truck exhibit only occupied about half of the automobile building. The remainder was well filled with a Canadian war exhibit which consisted of trophies from the battlefield and pictures of battlefields over which our own and the allied armies are fighting. The pictures were particularly instructive for they gave one a better realization of what has been and is being done over there, than he could get in any other way. This proved to be one of the most, if not the most, popular exhibit on the grounds.

Last year the horse show was an innovation which proved so satisfactory that a similar but somewhat larger one was held in connection with this year's exposition. Heretofore the horse show has been held in a tent and the dairy cattle judged in the open. This year the Cattle Congress Association built a splendid amphitheatre capable of seating about 3,000 people. It is not completely roofed yet and probably will not be until building conditions return to somewhere near normal levels, but a canvas roof has been prepared for stormy weather.

The Butter Contest

Entries in the butter contest were one-fourth more numerous than last year and fully as good in point of quality. But one of the 30 entries in the whole milk class scored less than 90. Harley Everte, Iowa, won first in this class with a score of 97, H. C. Ladage, Iowa, entered the second prize sample that scored 96¾, and the third prize was won by Theo. F. Slack, Iowa, where butter scored 96½.

In the gathered cream class, 61 entries, M. P. Christenson was first with a score of 96, and J. O. Ersland, J. M. Rasmussen, and E. M. Guiney competed for second place with scores of 95 each.

The class for navy butter was a new one this year which perhaps accounts for there being only 12 entries. R. Jorgensen won first in this class with a score of 95, Chris Russler, second, with 94.75, and W. P. Hughes with 94.7.

There were 9 entries in the American Cheddar Cheese class, C. G. Strombach, Minnesota, winning first on 95, Village Cream Factory second on 94, and H. A. Kalk, Wisconsin, third, with 93½. With but five entries in the cottage cheese contest, F. H. Merkley won first, G. A. Hanson, second, and Frank Brunner, third.

The United States Department of Agriculture had two booths of interest to creamerymen, one of them to demonstrate a creamery accounting system, the other to show how cottage cheese is made.

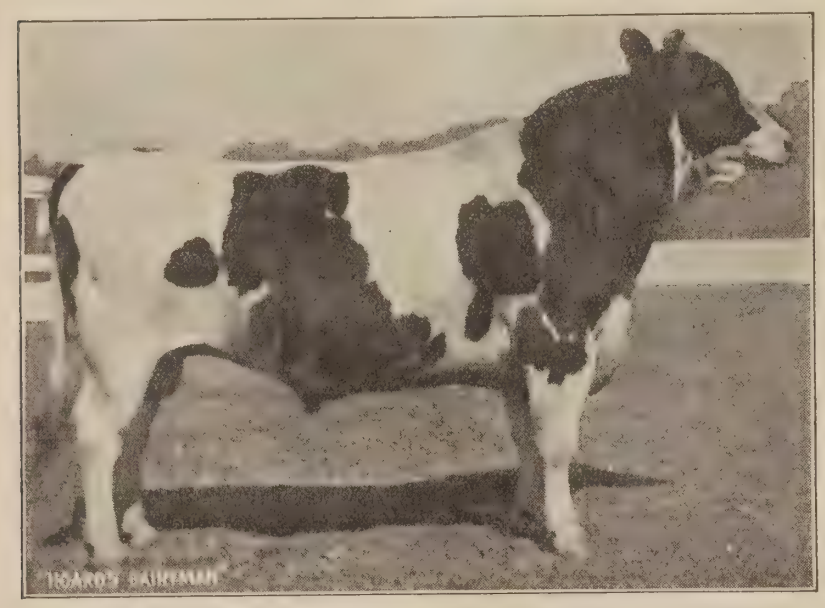
The Ayrshire Sale

For the first time, a consignment sale of Ayrshires was held at the Dairy Cattle Congress. Forty-nine animals from 5 different herds were sold for $18,340, an average of $374. Bargenoch's Rising Star, Van Etta's herd sire that has been a very successful show ring contender for the past few years and that is transmitting his type to his offspring, topped the sale, going to D. W. Henderson for $3,500. His nearest competitor among the bulls was Auchenbrain Union Jack that sold for $525. Henderson's Laurie, consigned by Aldebaran Farm, Wis., was the top female, going to D. W. Henderson for $850.

The entire sale was not a complete success. Cattle of that quality are worth more money than some of these brought. One reason for the low prices was that this was practically the first consignment sale of Ayrshires ever held in the middle west. Another is found in the fact that some of the animals were not in very good condition. Col. Geo. W. Baxter did the selling with Clyde Smith of the Ayrshire Breeders' Association in the box and D. W. Henderson serving as sale manager.

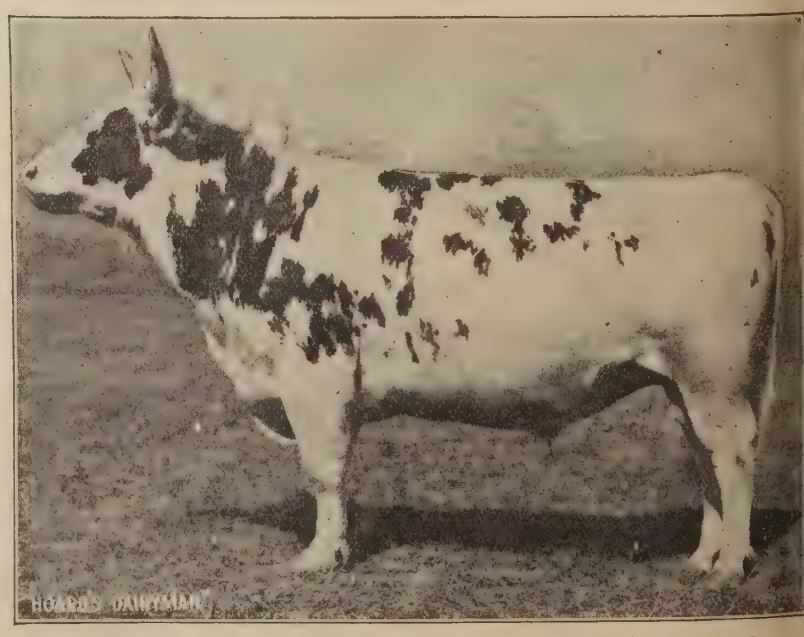
Dairy Council and Association Meeting

One of the most important and most interesting meetings at this year's congress was a joint meeting of the Iowa State Dairy Association and the Iowa Dairy Council to which had been invited representatives of the dairy industry from neighboring states as well as all interested Iowans.



After the banquet, Mr. Hugh G. Van Pelt, acting as toastmaster, opened the program by giving a brief history of the Dairy Cattle Congress which was started nine years ago by the State Dairy Association. The show was started for dairymen and those interested in dairying or allied lines. It was later sold to the city of Waterloo, but only on the understanding that this be continued as the primary object of the exhibition and as Mr. W. R. Law, president of the Congress and the next speaker, pointed out, this has been done.

Mr. M. D. Munn, Minnesota, president of the American Jersey Cattle Club and of the National Dairy Council, was the principal speaker of the evening. In opening his address, Mr. Munn called the attention of the hearers to the seriousness of the present situation of the dairy industry. We are the most important dairy nation in the world and at the present time are under the responsibility of supplying dairy products not only for ourselves, but also to a large extent for our allies. Last year we produced 45 billion quarts of milk, a generous part of which was used to supply the export trade. This amount of milk is less than enough to supply our own population did everyone use as much as Dr. McCollum recommends, and it is vitally necessary to develop a home market for dairy products that will take care of the surplus which will result when our abnormal foreign demand ceases. Furthermore, the speaker asserted, it is essential for the welfare of our people that they be educated to a sufficient use of dairy products because only those people who do consume dairy products reach their best and highest development. To accomplish this is one aim of the Dairy Council.



Mr. Munn talked at considerable length about present conditions. He spoke of the present shortage of dairy products and prospects of consequently high prices. This would not necessarily be a boon to the industry since it would encourage the use of substitutes here at home and make possible a surplus of milk, butter, etc., when our foreign war demand ceases. This in turn would discourage the industry just as an under-supply

OWNED BY ADAM SEITZ, WISCONSIN

too high prices are actually injurious to the general public, children in particular. To meet this condition, or rather prevent it, it is highly probable that the Food Administration will fix a minimum price for butterfat.

In conclusion the speaker asserted that of the 14 major dairy states, New England included as one, 10 had already formed state dairy councils and that he hoped to see the other 4 organized in 30 days. These state councils are to be dairymen's organizations and by uniting them in a national council, a very strong organization should be effected.

Dean C. F. Curtis of the Iowa State College spoke briefly of the farmer as a man and it his contention that the farmer who successfully owns and controls a $30,000 to $50,000 farm is no ordinary man. Further than that, the farmer is today producing an increased amount of food in the face of the present labor shortage, while men in general, who are engaged in the trades, have shown no such increase in efficiency. Dean Curtis pointed out the necessity of increasing this efficiency still further as one of the factors that will assist in a successful prosecution of the war.

Mr. W. B. Barney, state dairy commissioner, gave a brief history of the State Dairy Council and what its aims were. Following his talk, butter prizes were awarded and the butter on exhibit at the show sold.

Holstein Breeders' Banquet

Holstein breeders did not put on a very good cattle show but they did hold a very successful banquet Wednesday evening of the Cattle Congress at the Russell-Lamson Hotel. The banquet was given by the Iowa Holstein Breeders' Association, and following it was a most satisfactory program, President Cass presiding.

Mr. Evans, Deputy Commissioner of Agriculture in Manitoba, spoke very briefly, calling the attention of his audience to what the province had already accomplished along dairy lines and what still remained to be done. It seems that as late as 1912 butter and dairy products were imported to help supply the needs of a population that really should have been producing enough to more than supply their own needs. The local department of agriculture realized this and started a campaign of dairy education, one result of which is that that same province is today exporting dairy products, this in spite of war's handicap.

Mr. Evans called particular attention to the fact that the Holstein cow fills the need of the Canadian farmer who lives, perhaps, quite a distance from a railroad and who wants an animal that very nearly approaches the much talked of dual-purpose cow. Already the government has purchased a considerable number of Holsteins from dairy sections and sold them to the farmers on long time notes, but there is still a great market for the Holstein cow in that particular province.

D. J. Murphy, president of the State Dairy Association, when speaking a little later, pointed to cheese as one of the best markets for Holstein milk and to cheesemaking districts as the best of markets for good Holsteins. Mr. Murphy has himself been very successful as an organizer of cheese factories in Northeastern Iowa and if one might judge from his talk, he would appreciate having Holstein breeders do more to develop a market in that particular section.

Fred W. Merrill of Kimball's Dairy Farmer spoke of the necessity of increasing the number of our dairy cows to supply the present growing demand for dairy products and the demand for dairy cows that is bound to come from war stricken Europe

EDGARD L., JUNIOR AND GRAND CHAMPION BROWN SWISS BULL AT THE IOWA DAIRY CATTLE CONGRESS
OWNED BY L. S. MARSHALL & SONS, MICHIGAN

once this war is over. Mr. Merrill supported the stand that it is a crime to slaughter any dairy cow no matter how unprofitable a producer she may be.

John B. Irwin of Minnesota spoke briefly regarding the present increasing use of butter substitutes. He called attention to the fact that today in some dairy sections the use of substitutes even among dairy farmers has increased from 50 to 75 per cent since the war commenced. As a remedy he urged a campaign of education to make producers as well as consumers realize the true value of dairy products.

D. D. Aitken, president of the Holstein-Friesian Association of America, was really the speaker of the evening. Closely connected with both the National Dairy Council and the largest dairy breed association in the country, Mr. Aitken is particularly well fitted to speak on conditions that are affecting the entire dairy industry. He spoke not as a breeder of Holsteins, but as a dairyman. His advice to every breeder was to think just a little less of his own particular business and more of the entire industry because every cattleman, whether he be breeding Holsteins or Jerseys, must stand or fall with it. Moreover, every breeder should be a member of his own particular breed association, his stand on the matter being that the man who is not willing to pull his weight in his association will not succeed as a breeder.

Regarding the matter of prices of dairy products, President Aitken stated that at present he was more afraid of too high prices than too low. The former will discourage home consumption so that when the present export demand stops, there will be no home demand to absorb the surplus that is bound to accumulate. Last year we exported 1,000,000,000 lbs. of milk. A few years after the war there must be a market in this country for this enormous quantity.

The Cattle Exhibit

In spite of extreme labor difficulties this season, the cattle exhibit was fully as heavy as at last year's show and quite up to it in the matter of quality. The Holsteins made the poorest showing in years and one not at all comparable with that put on by the other breeds. Even the Brown Swiss, the least numerous of any of our dairy herds, made a better showing in point of numbers and one of fully as good quality.

Two hundred ninety-eight cattle from nine different states were entered.

Jerseys

Exhibitors:—Ed. C. Lasater, Texas; Longview Farm, Missouri; Myrtle E. & Earl F. Pyle, Ohio; Oscar L. Casey and L. R. Sisson, Iowa.

Judge: M. D. Munn, Minnesota.

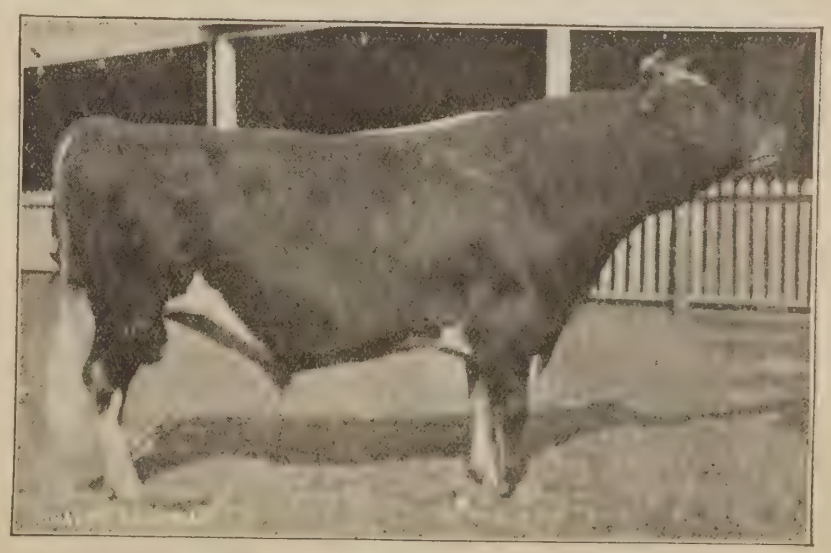
The Jersey show this year was but little larger than that of last, there being but 75 animals entered. It was, however, fully up to previous shows in the matter of quality and in practically every class competition was exceedingly close.

Raleigh's Oxford Prince from Lasater's herd and Flora's Queen's Raleigh, the Longview entry, were the only aged bulls shown. Both of them are excellent representatives of the breed, and there was considerable speculation among those at the ringside as to which would find favor in the judge's eye. The latter has a wonderfully deep body, with well sprung rib. He was, moreover, very well fitted, better than the Texas sire. However, he was just a little too heavy over the shoulders and not quite good enough in placing of rudimentaries to win over his southern rival.

It was not until the two-year-olds were brought out that the real champion of the show was uncovered. Poet's White Heart, Longview's entry, was an outstanding first with his really excellent type, his depth, and his style. His chief criticism, and it is a hardly noticeable one, is a slight tendency toward a weak top. He is so good that Mr. Munn did not hesitate long in awarding him senior and grand championship honors.

Noma's Perfect Raleigh, one of Longview Farm's junior bull calves, was by all odds the best bull calf shown. He was not only an outstanding calf, but he was extremely well fitted and entered the ring in the very pink of condition. Winning in his class, he easily outdistanced his older rivals in the contest for junior championship.

The female classes were better filled than were the bulls, and competition was keener. Eight aged cows were shown and among the top four, any one could have been grand champion with credit to the breed. Oxford Majesty Crocus, from the Missouri herd, is a really wonderful type of dairy cow, particularly when one considers her age, 10 years. She has an excellent udder, fairly well placed teats, and the very best of milk veins. Moreover, she showed more capacity and more depth of body throughout than Willow's Brightness, the Falfurrias entry. The old cow, however, was not in the best of flesh. She had been milking since February and showed in just good dairy form while her rival that had recently freshened was in much better show shape. The older cow is not as full back of the shoulders and her fore udder is breaking away a very little, but we believe she was the best cow. Judge Munn, however, thought otherwise and placed the Texas cow first. She was later senior and grand champion.



Another very close contest was between the four-year-old entries from these same herds. Swanigan, with Longview, showed an extremely stylish cow, Undulata Nena. She had finish and an excellent shaped udder with very well placed teats. She was, however, just a little lacking in veins and depth as compared with Constance of Falfurrias, owned by Mr. Lasater and it was these very things that beat her.

Raleigh's Oxtivity, Longview's junior yearling heifer, was junior champion.

The complete awards are as follows:

Bull 4 years or over—1, Lasater on Raleigh's Oxford Prince; 2, Longview Farm on Flora's Queen's Raleigh. Bull 3 years, under 4—1, Longview Farm on Warder's Chieftain; 2, Pyle on Angelica's King. Bull 2 years, under 3—1, Longview Farm on Poet's White Heart; 2, Pyle on Sans Aloi's Niece's King; 3, Lasater on Esther's Eminent Noble. Bull 1 year, under 2—1 and 2, Longview Farm on Chief Raleigh and Dahlia's Noble Fern; 3, Lasater on Olive's Calla Allen; 4 and 5, Pyle on Rosa Sans Aloi K. and Financial Richmond. Bull calf, six months, under 12—1, Lasater on Royal Majesty of Falfurrias; 2 and 3, Longview Farm on Warder's Oxford Chieftain and Raleigh's Bright Prince; 4, Pyle on King's Rosa's Sans Aloi E. Bull calf under 6 months—1 and 4, Longview Farm on Noma's Perfect Raleigh and Jolly Oxford Majesty; 2, Pyle on Stockwell's Niece's King; 3 and 5, Lasater on Sensation's You'll Do and Rosebud's Royal Majesty.

Cow 5 years or over—1 and 4, Lasater on Willow's Brightness and Stockwell's Noble Wonder; 2 and 3, Longview Farm on Oxford's Majesty Crocus and Fairy Glen's Flora; 5, Casey on Woodvill's Best Coinage. Cow 4 years, under 5—1, Lasater on Constance of Falfurrias; 2, Longview Farm on Undulata Nena; 3, Pyle on King's Columbine F. Cow 3 years, under 4—1 and 2, Longview Farm on Rower's Benedictine Glory and Fontaine's Pretty Maiden; 3, Lasater on Aldan's May

"The House That Pays Millions for Quality"

"What Can I Reasonably Expect of a Tractor?"

SO MANY farmers ask us this question that it deserves a public answer. When you buy an International kerosene tractor you can expect—

Plowing, as deep as you need, as fast as good plowing can be done, at low cost because your tractor operates on kerosene.

Good work on plowed ground. This is important. You can use your tractor for all the seed bed work, giving your crops a better start and a better chance.

All kinds of belt work. Individual threshers, ensilage cutters, feed grinders, hay presses, and many other useful, labor-saving belt machines soon follow an International tractor because it does good belt work at low cost.

An International will haul your crops to market, clear your land, grade and level roads. In any size or style it is a true "general purpose" tractor, useful for all kinds of farm power work, built by a Company that has built farm machines and tractors in large numbers for many years.

That is what you may reasonably expect from an International kerosene tractor. The local dealer can give you any further information you want. See him or write direct to us.

Senior and Grand Champion Cow—Willow's Brightness. Junior Champion Cow—Raleigh's Oxtivity.

Guernseys

Exhibitors:—Island Farm, D. D. Tenney, Minnesota; W. W. Marsh, Mountain Bros., Dairyland Farm, Jos. Golinvaux, and Paul C. Elgin of Iowa.

Judge:—H. H. Kildee, Iowa.

As might have been expected from the result at earlier fairs, the Guernseys made an excellent showing at the Dairy Cattle Congress, better in many respects than some of the other breeds if one considers the actual number of Guernseys in this country as compared with the numbers of one or two other breeds. Seventy-one animals from seven different states were shown.

Among the aged bulls Ladysmith's Cherub, owned by Mr. Tenney, and undefeated since last year's Waterloo show, was an easy winner. He possessed considerably more style and depth and a much better top than his nearest competitor, Kenilworth Gold, from the Marsh herd, the bull that defeated him just a year ago. Ladysmith's Cherub was senior champion over Imp. Kitchener's Express, a very stylish two-year-old shown by Mountain Bros., and was later grand champion.

The largest bull class brought out was the senior calves with nine entries. Marie's Cherub of the Prairie, the winner, owned by W. W. Marsh, was easily the best bodied calf in the lot and he possessed sufficient style to go with it. He was not, however, sufficiently good to win over Cherub's Prince, the yearling from the same herd, in the contest for junior championship honors. The latter is a wonderfully growthy bull for his age. While he would easily pass for a three-year-old he is not at all coarse, and should prove a serious contender at future shows.

Imp. Bella 2d du Grand Fort, Island Farm's aged cow that has been a consistent winner at all earlier shows, ran true to form this time and finished with the blue in every individual contest in which she was entered. While she undoubtedly has minor defects, she is of the type that at once impresses anyone as a most excellent Guernsey and dairy cow. She won first in her class, senior and grand championship, and was also first in the class for Official Record Cows with records begun at 5 years or over and grand champion official record cow.

The very largest and perhaps the best female class brought out the junior champion. Thirteen junior calves were brought out and Professor Kildee spent considerable time, for him, before he finally placed them to his satisfaction with Cherub's Miss Mademoiselle of Shorewood, entered by Tenney, first. This calf is wonderfully deep bodied and straight, with a promising mammary system. She was so good that she was not only first in her class, but later junior champion.

The get of sire class brought out two of the very best groups shown. Marsh's entry included the grand champion bull, the junior champion bull, first prize senior bull calf, and the first prize junior yearling heifer. Opposed to them as the strongest competitor was a calf group entered by Tenney. These four junior calves, the get of Ladysmith's Cherub, were not only excellent calves, but were especially remarkable for their wonderful uniformity. They were, however, finally forced to yield to the older group.

Complete awards follow:

Bull 3 years or over—1, Tenney on Ladysmith's Cherub; 2, Marsh on Kenilworth Gold; 3, Island Farm on Gold Lassie's Julian; 4, Mountain Bros. on Cherub's Winner; 5, Dairyland Farm on Duke Sheet Anchor of Tilly Bardin. Bull 2 years, under 3—1, Mountain Bros. on Imp. Kitchener's Express; 2, Dairyland Farm on College Star's Dairyman; 3, Marsh on Ladysmith's Bopeep. Bull 1 year, under 2—1, Marsh on Cherub's Prince; 2, Island Farm on Maxim of Linda Vista; 3, Mountain Bros. on Cherub's Glenwood of Iowanola. Bull calf 6 mos., under 12 mos.—1 and 2, Marsh on Marie's Cherub of the Prairie and Lily du Preel's Prairie Gold; 3, Tenney on Cherub's Sergeant of Sherwood; 4 and 5, Golinvaux on Grace's Memento and Rosalie's Memento. Bull calf under 6 mos.—1, Tenney on Cherub's Corporal of Sherwood; 2, Marsh on Alyssum's Cherub; 3, Island Farm on Princess' Jewel of Island Farm; 4 and 5, Dairyland Farm on Star of Dairyland and Marie's Fanny Sequel.

Cow 5 years or over—1, Island Farm on Imp. Bella 2d du Grand Fort; 2, Tenney on Imp. Althea of Sarnia; 3, Marsh on Hayes Felois 4th. Cow 4 years, under 5—1, Dairyland Farm on Yeksa's Margarett; 2, Mountain Bros. on Martha W. of Alfalfa Farms. Cow 3 years, under 4—1, Tenney on Pearl's Dot; 2, Marsh on Figtree of the Prairie; 3, Island Farm on Starlight May Rose. Heifer 2 years, under 3—1 and 4, Marsh on Imp. Prospects Rose des Hourds and Ingleside Pretoria Vrangue; 2 and 5, Island Farm on Bella's Gold Lassie and Bella Golden Lassie; 3, Tenney on Bell Buoy's Golden Lassie of City View. Heifer 18 mos., under 2 years—1, Marsh on Felois of the Prairie; 2 and 4, Island Farm on May Rose of Island Farm and Gold Lassie's Beldame; 3, Dairyland Farm on Bonny Boy's Beauty Eagle. Heifer 12 mos., under 18 mos.—1 and 3, Marsh on Bopeep Queen 2d and Golden Cherry of the Prairie; 2, Golinvaux on Hope of Highland Place; 4, Tenney on Pearl's Golden Secret Girl; 5, Dairyland Farm on Flossette of Grayside. Heifer calf 6 mos., under 12 mos.—1 and 3, Island Farm on Beda Maid of Island Farm and Milvia's Beda of Island Farm; 2, Dairyland Farm on Broad Ripple's Beauty Eagle; 4, Golinvaux on Beauty Mar's Alyssum; 5, Mountain Bros. on Cherub's Lilly of Iowanola. Heifer calf under 6 mos—1, 2, and 4, Tenney on Cherub's Miss Mademoiselle of Shorewood, Cherub's Ultra May Rose of Shorewood, and Cherub's Coquette of Shorewood; 3, Marsh on My Figtree of the Prairie; 5, Dairyland Farm on Dairyland Fancy.

Exhibitor's Herd—1, Tenney; 2, Marsh; 3, Island Farm; 4, Dairyland Farm; 5, Mountain Bros. Breeder's Young Herd—1, Marsh; 2, Island Farm; 3, Mountain Bros. Calf Herd—1, Tenney; 2, Marsh; 3, Island Farm; 4, Golinvaux; 5, Mountain Bros. Get of Sire—1, Marsh; 2 and 5, Tenney; 3 and 4, Island Farm. Produce of Cow—1, Marsh; 2 and 5, Island Farm; 3, Mountain Bros.; 4, Tenney. Dairy Herd—1, Marsh; 2, Island Farm.

Senior and Grand Champion Bull—Ladysmith's Cherub. Junior Champion Bull—Cherub's Prince.

Senior and Grand Champion Cow—Imp Bella 2d du Grand Fort. Junior Champion Cow—Cherub's Miss Mademoiselle of Shorewood.

Brown Swiss

The Brown Swiss made an excellen showing, probably the best show eve made at Waterloo for the breed. Th distinctive thing about the exhibi was the marked difference in type be tween the Montana herd and the tw from the Middle West. Bohart's cat tle represented the older type; wer thick, heavy cattle with more coarse ness than has been pleasing to th judges on the Middle West circuit.

The Michigan and Ohio herds divid ed winnings quite evenly with a num ber of very close placings. In th

aged bull class Judge Cort favored Marshall's Stasis' Boy of Sedgely over Dick of Lake View owned by Hull Bros. Dick of Lake View is of better dairy type, being cleaner cut throughout but lacks the scale of the Michigan bull and is hardly as desirable in breed type.

Grand championship went to Edgard L., the calf owned by Marshall. Judge Cort considered him to be a bull of great promise, being better in rump and back and of somewhat greater proportionate length.

Swiss Valley Girl 7th, Hull Bros.' famous winner, again attached the grand championship. She was a scalier individual than competed against her in the aged class and was superior in mammary development to all other females. Judge Cort followed the Brown Swiss score card closely in his judgment on females and criticised many of them severely because of their lack of mammary development.

The awards follow:

Bull 3 years or over—1, Marshall & Sons on Stasis' Boy of Sedgley; 2, Hull Bros. on Dick of Lake View; 3, Bohart on College Master. Bull 2 years, under 3—1, Hull Bros. on Vogel's College Boy; 2, Marshall on Marcus; 3, Bohart in Nich's Prize Master. Bull 1 year, under 2—1, Marshall on Bravura 2d's Son; 2, Hull Bros. on Supreme of Lake View; 3, 4, 5, Bohart on Gallatin Browny, Moose, and Alice's Master 2d. Bull calf under 1 year—1, Marshall on Edgard L; 2 and 3, Hull Bros. on Hoover W. and Irene's Reuben; 4 and 5, Bohart on Beauty C. W. N. and Dan C.

Cow 4 years or over—1 and 3, Hull Bros. on Swiss Valley Girl 7th and Bessie May; 2 and 4, Marshall on Brownie F. and Bessie F.; Bohart on Zell's Beauty. Cow 3 years, under 4—1 and 2, Hull Bros. on Reuben's Ruth and Bessie May 2d; 3, Marshall on Betsey Girl; 4, Bohart on Master's Upland Nick. Heifer 2 years, under 3—1 and 3, Marshall on Valley Girl M. and Jackson Lady; 2, Bohart on Master's Lady D. 2d; 4 and 5, Hull Bros. on Swiss Valley Girl 10th and Bessie May 3d. Heifer 1 year, under 2—1 and 3, Marshall on Betsey Girl's Bravura and Beaut's Bravura; 2 and 5, Hull Bros. on Belle of Lake View and Nina of Lake View; 4, Bohart on Master's Lady D. 3d. Heifer calf under 1 year—1 and 2, Marshall on Mollie 2d and Styx 2d; 3 and 5, Hull Bros. on Swiss Valley Girl 7th Merney and Cinderella of Lake View; 4, Bohart on Beauty D.

Exhibitor's herd—1 and 3—Marshall; 2 and Hull Bros.; 5 Bohart. Breeder's Young herd—1, Marshall; 2, Hull Bros.; 3, Bohart. Calf herd—1, Marshall; 2, Hull Bros.; 3, Bohart. Get of Sire—1 and 2, Marshall; 3 and Hull Bros.; 5, Bohart. Produce of cow—and 3, Marshall; 2 and 4, Hull Bros.; 5, Bohart. Dairy Herd—1, Hull Bros.; 2, Marshall; 3, Bohart.

Senior champion bull—Vogel's College Boy. Junior and grand champion bull—Edgard L. Senior and grand champion cow—Swiss Valley Girl 7th. Junior champion cow—Mollie 2d.

BARGENOCH SILVER PET, SENIOR AND GRAND CHAMPION AYRSHIRE COW AT THE IOWA DAIRY CATTLE CONGRESS
OWNED BY ADAM SEITZ, WISCONSIN

Ayrshires

Exhibitors:—Adam Seitz and Jas. Van Etta of Wisconsin, and C. H. Peverill, Iowa.

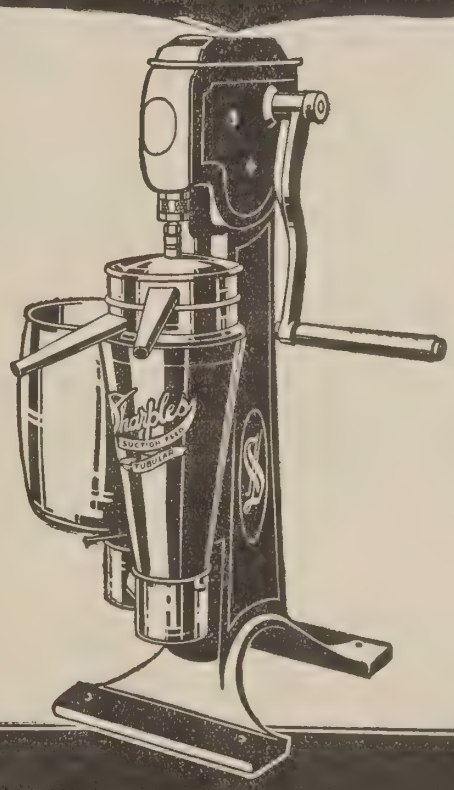
Judge:—Hugh G. Van Pelt, Iowa.

Three full herds made the Ayrshire show this year a larger and more interesting one than usual and practically all of the entries were good enough so that the judge's work was far from being easy sailing.

The aged bulls made a very good showing. Two of the entries, from the Seitz and Van Etta herds, were sons of Imp. Bargenoch Gay Cavalier and both of them bore the stamp of that veteran show ring contender. Bargenoch Rising Star, from Van Etta's herd, is a mature bull of excellent type. He is straight, deep bodied, and has plenty of quality but he lacked the style, finish, and stretch of Cavalier's Lord Roseberry, Seitz's 3-year-old entry. It was not a case of the older bull being weak but of the younger being especially strong that gave him the blue.

The real battle royal in the bull classes, however, came when the winner in the aged class met Cavalier's Lord Stuart, the winning two-year-old from the same herd. The latter has been a consistent winner not only in his class but also for championship honors and only once before this season has the older bull been the victor. The Stuart bull, also a son of Gay Cavalier, is in many respects an exceptional animal. His unusually good forequarters, depth of body, and general style makes him a hard one to beat but his older stable mate carries just a little better top and tail setting, and a much better length of hip and body, which makes him a somewhat better dairy type of bull and incidentally in this particular case gave him senior championship and later grand championship honors.

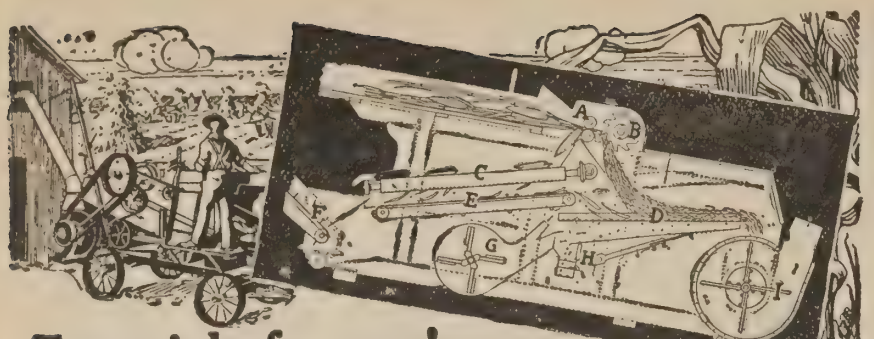
Cavalier's Netherall Chancellor, Seitz's winning senior calf, was junior champion.



The influence of Gay Cavalier did not stop with the male classes. One of his daughters, Bargenoch Silver Pet, was first among the aged cows, and a second, Cavalier's Lady May Stuart, proved the winning three-year-old. The latter had freshened within twenty-four hours so that she did not show in the very best of condition. This, together with a low attachment of rear udder, put her second to the old cow in the contest for senior championship.

Nearly all of the heifer and heifer calf classes were well filled and two or three of them proved as difficult to place as any in the entire show. The winning underage female was Cloverdale Fashion Plate, a junior calf from Van Etta's herd. She is an exceptionally typy heifer, well grown, and with plenty of quality, but she was not strong enough to win against the aged cow for grand championship.

The complete awards follow:



Bull 3 years or over—1, Seitz on Cavalier's Lord Roseberry; 2, Van Etta on Bargenoch Rising Star; 3, Peverill on Willowmoor Robin Hood 19th. Bull 2 years, under 3—1, Seitz on Cavalier's Lord Stuart. Bull 1 year,

BRANCHES: CHICAGO SAN FRANCISCO TORONTO

Essential—for you!

You've got a *labor* situation to face. Hand husking is a long hard job. This Appleton machine will save hand husking and

save the entire *cost* of husking

—by doubling the feed value of the fodder and the fertilizer value of the manure. This is no theoretical increase—actual Government tests and thousands of farms have proved that this increases the value of the corn crop at least 20%. The Appleton husks the ears, cuts or shreds stalks and leaves, elevates ears one way and blows fodder the other. (See diagram.)

A. Snapping rolls
B. Cutter or Shredder head
C. Husking rolls
D. Separating Screen
E. Husk carrier
F. Ear corn carrier
G. Cleaning fan
H. Grain saver
I. Blower

The first successful machine husker —acknowledged leader for 20 years

Husking rolls are the original Appleton patent. Husk clean as by hand—they simply peel off the husks—no harsh acting pickers or such devices that shell corn. Cutter or shredder head interchangeable. Built so safe, strong and simple that models made years ago still give good service. "I have had my Appleton 6 years and never paid 1c for repairs. F. W. Serviss, St. Johns, Mich." Made in 2, 4, 6 and 8 roll sizes for 4 h.p. and up.

APPLETON
Husker & Shredder

We've been in the farm machinery business for nearly half a century and we don't know of *any* other machine that is *so certain* to be profitable *right from the first*, to any farmer who raises corn. Can you afford to ignore such facts as these —with labor scarce and high priced, with feed three times as valuable as before the war and with the Government calling for conservation? Husking time is soon here. Go into this proposition *now*—send for our big free book today.

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED

We Designed Our Own Transmission

Don't overlook the Transmission when you buy your tractor. Next to the engine, it is the most important part of the tractor.

LAUSON Transmission was designed by our own engineers—selective sliding gear type—two speeds forward, one reverse. Transmission gears are made of the finest alloy steel—heat treated for a glass hard finish with annealed center; tough, resisting, long wearing. Splined shafts are used and all mounted in Hyatt roller bearings. Gears and bearings run in oil in dust-proof case.

Drive Shaft is of high carbon steel. Final drive gears are semi-steel, machine cut—all completely enclosed in a dust-proof housing and running in oil.

We have important information which you should take into consideration before purchasing a tractor. We will be glad to send it to you without any obligation and give you the name of our nearest dealer where you can inspect the LAUSON 15-25.

Twenty-Three Years of Engine Building Experience

For twenty-three years we have been making LAUSON Frost King Engines—the standard of farm engine excellence. 1½ to 18 H. P.

Senior and Grand Champion Cow—Bargenoch Silver Pet. Junior Champion Cow—Cloverdale Fashion Plate.

Holsteins

Exhibitors: Chestnut Bros., Kansas; Mayowood Farm, Minnesota; H. O. Larsen, J. H. Cleverly, E. J. Erickson, and Cass Farm Co., of Iowa.

Judge: W. S. Moscrip, Minnesota.

The Holstein showing at most of the fairs this year has been very light and that at the Dairy Cattle Congress was no exception. Quite the contrary; it was even lighter than might have been expected from the earlier shows. Only 44 animals entered the ring as against well over 100 some other years. The showing in many classes was so small that most of the prize money was unclaimed and in one case, not a single animal was entered.

As classes the bulls were consistently poor although several excellent individuals were brought out. There were but two aged bulls, Johanna Ondine Grahamholm Lad from the Mayowood Farms and Johanna Bonheur Champion 2d entered by Chestnut Bros. Both were very good Holstein bulls, but the Kansas entry possessed enough more style and general smoothness of conformation to make him an easy first and senior champion.

The younger bull classes were better filled and Judge Moscrip had several good ones to pass on in the competition for junior champion. Johanna Glenda Lad, an outstanding yearling, and Ondine Homestead Posie, winning junior calf, both from the Mayowood herd were the closest competitors. The yearling possessed plenty of style and was of good type but he was a bit too high on his legs to win from the younger animal, which was an exceptionally good one.

Johanna Bonheur Champion 2nd was grand champion.

The females were much better than the bull classes and one of them, the senior heifer calves, proved the best of the entire show. There were nine calves entered and the first three were close enough to keep most of the spectators guessing. Cass Farm had two very good entries and Mayowood Farm one that offered them plenty of competition. Choice for first place finally narrowed down to Glenda Ondine Doede from the Minnesota herd and Sadie Fobes Homestead entered by Cass Farms. Both were deep bodied, straight, growthy calves but the former lacked a little of the life, pep if you will, so necessary for successful showing and the Cass entry was placed first, later winning junior championship.

There were but 2 aged cows entered, Almeda Luecke Hengerveld by Cass and Mayowood Fernwood DeKol from the Minnesota herd. These two were fairly evenly matched, the former excelling particularly in her veining and udder, the latter in depth of body. Mr. Moscrip decided in favor of the Iowa entry and later made her senior and grand champion.

The detailed awards follow:

Bull 4 years or over—1, Chestnut Bros. on Johanna Bonheur Champion 2d, Mayowood Farm on Johanna Ondine Grahamholm Lad. Bull 3 years, under 4—1, Cass Farm Co. on King Aaggie Hengerveld. Bull 2 years, under 3—1, Cass Farm Co. on Fayne Bessie Homestead; 2, Westfall on Sir Mercedes Piebe Ormsby. Bull 1 year, under 2—1, Mayowood Farm on Johanna Glenda Lad; 2, Larsen on Sir Korndyke Clothilde Forum; 3, Cleverly on Sir Pietertje Watson Homestead; 4, Erickson on Oakdale Spring DeKol. Bull calf 6 mos., under 12 mos.—1 and 2, Erickson; 3, Cleverly on Fairlawn Burke Ormsby; 4, Larsen on Sir Korndyke Pontiac Forum; 5, Mayowood Farm on Ondine Colantha Hazeltine. Bull calf under 6 mos.—1, Mayowood Farm on Ondine Homestead Posie; 2 and 3, Cass Farm Co. on Aaggie Almeda Hengerveld and Aaggie Hengerveld Lilith Walker.

Cow 5 years or over—1, Cass Farm Co. on Almeda Luecke Hengerveld; 2, Mayowood Farm on Mayowood Fernwood DeKol. Cow 4 years, under 5—1, Larsen on Bracelet Clothilde Korndyke. Heifer 2 years, under 3—1 and 5, Larsen on Forum Aaggie DeKol and Forum Hartog Rauwerd; 2 and 4, Cass Farm Co. on ———— and Mercedes Aaltje Johanna; 3, Mayowood Farm on Johanna Ondine Soo. Heifer 18 mos. and under 2 years—1 and 2, Mayowood Farm on Posie Homestead Ondine and Johanna Tritomia Mercedes; 3, Cass Farm Co. on Alcartra Pink Johanna; 4, Erickson on Beauty Ina Segis Lone Cedar. Heifer 12 mos., under 18 mos.—1, Cass Farm Co. on Pietertje Fayne Concordia. Heifer calf 6 mos., under 12 mos.—1, 3, and 4, Cass Farm Co. on Sadie Fobes Homestead, Aaggie Hengerveld Carlotta, and Aaggie Hengerveld Daisy Homestead; 2 and 5, Mayowood Farm on Glenda Ondine Doede and Mayowood DeKol Fernwood. Heifer calf under 6 mos.—1 and 3, Cass Farm Co. on Aaggie Hengerveld Canary Segis and Aaggie Mona Clothilde; 2 and 4, Mayowood Farm on Johanna Korndyke Ruth and Avanelle Canary Ondine; 5, Larsen on Owanda Barber Cornucopia.

Exhibitor's herd—1, Cass Farm Co.; 2, Mayowood Farm. Breeder's young herd—1, Mayowood Farm; 2, Cass Farm Co. Calf herd—1, Cass Farm Co.; 2, Mayowood Farm; 3, Larsen. R. B. Young's Special—1, Cass Farm Co. Get of Sire—1 and 3, Mayowood Farm 2, Cass Farm Co.; 4, Larsen. Produce of cow—1 and 2, Mayowood Farm; 3, Cass Farm Co.; 4, Larsen.

Senior and grand champion bull—Johanna Bonheur Champion 2d. Junior champion bull—Ondine Homestead Posie.

Senior and grand champion cow—Almeda Luecke Hengerveld. Junior champion cow—Sadie Fobes Homestead.

Dairy Exhibit at the South Dakota State Fair

HOARD'S DAIRYMAN:—Unique among the exhibits in the dairy building at the South Dakota State Fair was the booth of the Dairy Husbandry Department of the State College. At one side was a chart showing the production of two cows. The first cow, representing the average dairy cow of South Dakota, had been fed on a ration of 15 lbs. wild hay and 4 lbs. corn, producing 5 quarts of milk in one day. Contrasted to this was a picture of College Belle Wayne who had been fed a ration of 35 lbs. silage, 15 lbs. alfalfa, 4 lbs. corn, 3 lbs. oats, 8 lbs. bran, and 4 lbs. linseed meal, producing in one day 35 quarts of milk. The lesson was clear. Dairymen must feed more judiciously and breed better animals to get large production.

Three charts illustrated clearly the value of the pure-bred sire in increasing dairy production. Scrub cow 1 at the South Dakota Station, with a record of 4,125 lbs. milk and 174 lbs. fat, mated to a pure-bred Holstein sire, produced a daughter that milked 8,927 lbs. milk containing 307 lbs. fat. This daughter mated to a pure-bred sire produced a daughter that made 10,194 lbs. milk, 374 lbs. fat in one year. Another similar chart show

HE VERY LATEST
The 1916 Improved
TANCHION

ls giving thorough satisfaction, write to "MANE STANCHION WORKS," ARABOO, WISCONSIN, for Literature.

DON'T PUT OFF
eing your friends and having them join or a club of subscribers.

the three generations, a scrub cow and her daughter and granddaughter, the two sired by pure-bred Holstein bulls. The production of the three was 139.5, 228.7, and 304.3 lbs. fat respectively in one year. A pure-bred Jersey sire, mated to a scrub cow with a record of 3,286.5 lbs. milk, 139.5 lbs. fat, produced a daughter with record of 6,993 lbs. milk, 330 lbs. fat, an increase of over 115 per cent.

The creameries of South Dakota are also doing their bit in producing butter. Thirty-five million pounds are produced annually, enough to make a solid wall 20 inches high between North and South Dakota if laid in pound prints; or, as the dairy husbandry department said, enough to feed our boys "over there" for 180 days.

The advertising of dairy products was not overlooked. A miniature cow was mounted on a small box with the inscription "Without the dairy cow we could not have these foods", and below her were placed milk, cream, condensed milk, brick ice cream, pie a la mode, cheese, and cottage cheese. The value of dairy products as food was brought out in a comparison of cottage cheese to other protein foods. This showed one pound of cottage cheese costing 20c to contain as much protein as 13 eggs costing 43c, 1.11 lbs. salmon costing 44c, 1.58 lbs. pork chops costing 71c, 1.27 lbs. sirloin steak costing 44c, 1.44 lbs. smoked ham costing 64c.

The showing of dairy cattle was limited to Holsteins, seven herds being represented by 49 animals. The champions were outstanding animals of the breed. The grand champion bull was Sir Ollie Watson, who has five times won the purple this season. Although but two years old he possesses great style and masculinity coupled with almost perfect Holstein type. The grand champion female was Lilac Hedge Bismarck Colantha, a very showy 4-year-old matron nearly perfect in type but lacking scale. Another season she should be a strong contender in the aged cow class. Both grand champions were owned by D. C. Bacon, North Dakota. The other exhibitors, all from South Dakota, were: P. R. Crothers & Son, Frank E. Johnson, Robt. Cleveland, A. M. Knutsen, South Dakota State Penitentiary, and E. A. Howell.

Following is a list of the awards:

Bull 3 years or over—1, Bacon on King Watson Segis Star; 2, South Dakota State Penitentiary on Redfield Korndyke DeKol Burke. Bull 2 years and under 3—1, Bacon on Sir Pontiac Ollie; 2, Crothers on Sir Veeman Wayne Hengerveld Vale; 3, Howell on King Florence. Senior yearling bull—1, South Dakota State Penitentiary on Sioux Joh Lyons. Junior yearling bull—1, Bacon on Lilac Hedge Sir Colantha. THE McDonald Pitless Scale eliminates all guessing. It stops the leaks and is a constant source of profit and satisfaction. No progressive farmer can afford to be without a reliable scale.

The McDonald is the original pitless scale. It is easy to erect and easy to move. We guarantee it to retain its accuracy for 10 years to U. S. Standard weights. However, it is so substantially and finely constructed that it will retain its accuracy from 20 to 25 years with practically no repairs. There are thousands of McDonald Pitless Scales in daily use by railroads, manufacturers, mill operators, farmers, stockmen, in fact, in every line of business in which a wagon scale is necessary—the best evidence of their superiority.

Ask your Moline Dealer about the McDonald Pitless Scale or write us for full information.

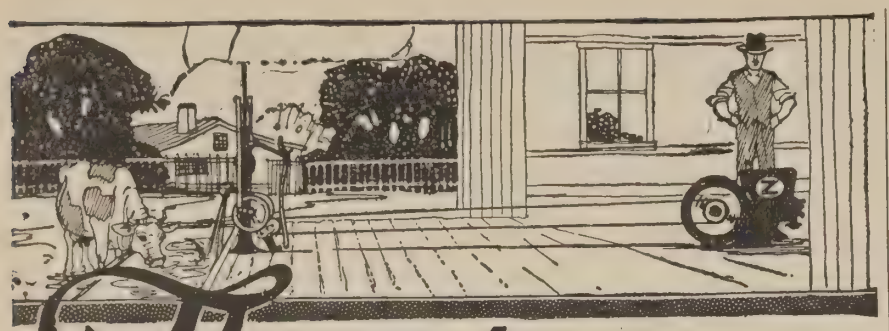
Put HASSLERS on your Ford and you'll think someone plugged a hole in your gas tank

The easier your Ford rides, the less gasoline it takes to run it. Make your Ford ride like a $2,000 car and secure the last bit of power from every drop of gas. Install the

For FORD Cars — **HASSLER** PATENTED **Shock Absorber** — *For FORD Cars*

Hasslers enable you to save gas in two ways:
First, they make your Ford ride so smoothly it requires less power to run it.
Second, they enable you to take the roughest spots without shifting into low or changing speed.



Hasslers achieve economy by making your Ford *comfortable*. They stop all jolts and jars, decrease vibration, prevent sidesway and rebound, and make your Ford easier to steer and safer to drive. By doing this, they cut your expenses for gas, tires, up-keep, and increase the resale value of your car.

10-DAY FREE TRIAL OFFER

Write today for FREE TRIAL BLANK and we will have a set of Hasslers put on your Ford without a cent of expense to you. Try them 10 days. Then, if you are willing to do without them, they will be taken off without charge. Don't ride without Hasslers simply because someone discourages you from trying them. Accept this offer and see for yourself. *Nearly a million of the Patented Hasslers now in use.*

Re-testing Cattle for Tuberculosis

(Continued from page 403)

or state and federal accredited herds.

2. It would seem unnecessary to have tests made by both states, particularly if proper care is exercised in making and supervising the test in the state from which shipment is made and proper care is exercised by the purchasers in selecting agents by whom the purchase is made and the methods used in assembling and testing the animals by these agents.

3. Such double testing will certainly make it difficult for the trade in cattle and will discourage trade. Certainly some loophole should be made for those herds that are tested each year and safe herds from which to purchase. These requirements call attention of breeders to necessity of getting their herds cleaned up but at the same time they are more stringent than they ought to be.

4. Such regulations, of course, tend to keep tubercular cattle out of the state, but it places a lot of risk upon those who sell cattle for which they must of course be paid. When rules are thus made too stringent, it is possible that the building up of the dairy industry from improved cattle will be somewhat hindered and delayed.

5. I think that this ruling should be modified so that the testing is done in the states from which the cattle are shipped and purchasers be advised to take cattle only that have been tested under normal and favorable conditions. The test should be broadened so as to require not only a subcutaneous test but also an eye test and possibly the intradermal test. Make the test as searching as possible under the present development of science along that line. Veterinarians and cattle owners should be more thoroughly acquainted with the fact that any shady or unwise dealing affects the whole trade and eventually reacts upon themselves; that the state must strictly supervise or itself make tests for interstate shipment in order to protect trade in cattle; that interstate testing, if not all tuberculin testing, is a duty of the state for which the state is responsible and not the privilege of any profession or class of people.

One of the chief sources of errors in testing by which tubercular animals are permitted to pass the test is the so-called doping of cattle for the test by the injection of tuberculin. This is made possible by the fact that anyone can buy all the tuberculin they wish without record by simply crossing the state line for it and the state can have no jurisdiction over the purchase. The various states are endeavoring to control the sale of tuberculin but as long as there is no federal regulation controlling its sale, the state regulation will be of no avail and the evil will go on. There should be federal regulation controlling this and Wisconsin has asked for such regulation.

A further matter which states purchasing cattle should more fully recognize and make clear to their citizens is the fact that the most of the tubercular animals are brought in to their territory by professional buyers of cattle through the methods which they use in collecting animals and testing. Their usual practice is to buy up animals from many sources, gather them together in one place, usually at the local stock yards, have them driven in or hauled in and herded together under conditions which make them wild and excited to the highest degree. They are tied up by strangers and immediately tested also by a stranger. The effect of this is abnormal temperatures not due to disease but to the excitement. With such initial temperatures it becomes exceedingly difficult to determine from post injection temperatures whether a variation in temperature is due to the action of tuberculin or to excitement, and in fact any test made under these circumstances is so unreliable that no one can guarantee its accuracy. Any purchaser of any state who will persist in buying cattle and have them tested under these conditions is absolutely certain to get reacting animals and the most of the tubercular animals secured by states buying cattle have been obtained in this way.

It is also true that nothing is known of the history of these animals and the herds from which they came and the statements above concerning the uncertainty and lack of safety in buying cattle from untested herds even though the individuals themselves are tested, applies to everyone of the animals tested in this way. This state cannot and does not guarantee tests made in this way and every test sheet sent out which has been made in this way is and will hereafter be marked so that the official authorities of the state into which shipment is made, as well as the purchaser, may plainly see under what conditions the test is made.

The purchasers should also be acquainted with the fact that they can not expect to keep their purchase free from tuberculosis when they buy cattle that have been shipped from a non-dairy state into an important dairy state and kept in the latter state only long enough to be tested and reshipped as cattle coming from that important dairy state simply to get the reputation that the latter carries with it. It would be beneficial for the purchasing states to make sure that their agents are actually purchasing cattle from the state from which they think they are buying.

I believe these latter paragraphs carry some fundamental proposition that the trade in cattle might advantageously look into.

I wish to say I know it to be a fact that Wisconsin has a mighty host of clean herds of cattle from which any state can safely buy.

Dr. J. A. Kiernan of U. S. Bureau Animal Industry

Our Virginia correspondent's inquiry was also referred to Dr. J. A. Kiernan, Chief of Tuberculosis Eradication Division of the U. S. Bureau of Animal Industry. He replies as follows:

"You probably are aware of the fact that many cattle tested for interstate movement in a number of localities are afterward tested and found to be tuberculous. No doubt Virginia has experienced this on a number of different occasions, and believes that to protect the live stock industry of the state these regulations are necessary. This quarantine should certainly not discourage the live stock industry in any state, but should promote the interstate traffic of known healthy cattle.

"Frequent testing of dairy cattle not known to be detrimental to them in any way."

Dr. J. F. DeVine of New York

In reply to these same inquiries Dr. J. F. DeVine of New York makes the following statement:

"I have read with interest the regulations of Virginia and they would not suit me at all, either in the capacity of sanitary officer or as a breeder and shipper of cattle.

"In the first place, the time allowed between the tests and the time they may be shipped is altogether too long, that is, if there is any tuberculosis infection in the herd of which they are a part or if they should come out of a clean herd at time of test and then be kept free from exposure for the subsequent four months. As one who has had several years' experience

Does Mrs. Housewife Demand Your Butter?

She is the judge of butter value. *She knows* sweet, clean butter must be protected from dirt, dust and bad odors.

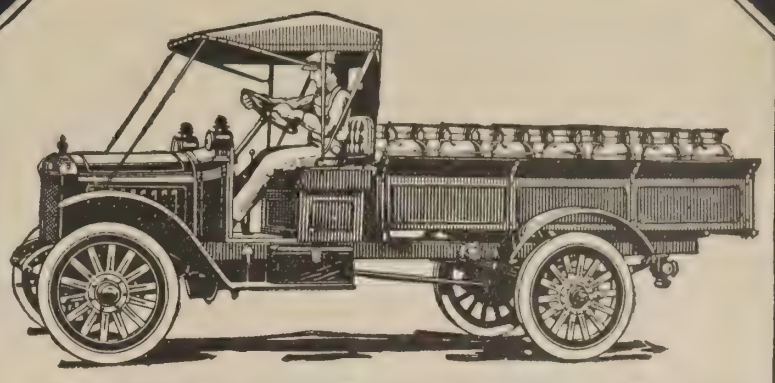
state sanitary control work and also as one who has bred and shipped cattle for a quarter of a century, I think three weeks previous to shipment is plenty of time for any shipper to arrange for and have a test made and it surely is as long a period as cattle ought to be subjected to exposure and then shipped as tuberculosis free.

On the other hand, if the cattle come from a free herd or a herd on the accredited list, as is now being arranged by the federal government and some states, and which I am positively in favor of, the holding of such cattle in quarantine and delaying their distribution or sale or whatever it may be, is an unnecessary hardship on the shipper with no sanitary advantage. However, if there is no proof that the herd is free from tuberculosis either by thoroughly reliable records or by being on the accredited list, it is desirable and advisable to hold the cattle in quarantine and make a retest. Diseased cattle coming from an infected herd may be passed by the most capable and conscientious veterinarian living and such animals may react on the retest after they reach their destination, that is particularly so of the animals that were in the incubative stage at the time of the initial test or that the disturbance by shipping accidents or systemic disturbance attendant upon it may cause a closed lesion to become an open one.



The statement that they shall not be retested under 60 days is not in keeping with our latest knowledge on the subject. If actively diseased ones have been purposely passed I believe as many would react on the 7th day after the test as would on the 60th day, and as for the incubative or closed cases the regulations could well read that the retest shall be made not earlier than 60 days after the previous test rather than from the date of arrival.

It is not detrimental to make frequent tests of dairy cattle, that is, the injecting of tuberculin in a healthy cow does not injure her in any way. It is true that a carefully conducted test where many preliminary temperatures are taken and the post temperatures continued for a long time after, that the cow is disturbed and broken of her rest but this is not serious as it happens only occasionally. To show that I practice what I preach: I have a herd of pure-bred Holsteins and Jerseys, some of the most noted families of each, and if there are enough interested in this question I would give my permission to have my herd tested every month for twelve consecutive months and I have no fear whatever that it will do them any harm.

I think these requirements can be modified to promote the live stock and dairy interests of the state. The requirement of two tests, if modified slightly, will protect and promote the interest of the purchaser in the case where cattle come from herds that are infected. It is an unfailing rule that every time a purchaser is protected and gets value received, it encourages, increases, and promotes faith and interest in that branch of industry, let it be what it may.

I do not think regulations, with rare exceptions, should ever be legislated into laws. The power should be given, by legislation, to the live stock executive officer or board to promulgate such rules or regulations as he or they deem advisable for the protection of the live stock interests.

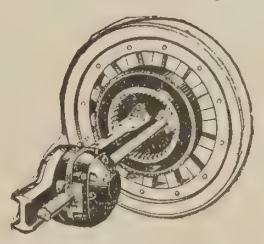
The delay and expense of testing cattle that are to be shipped into the state is well repaid if such tests and examinations are carried on carefully and in good faith. The previous test may save the purchaser the loss of many dollars that he might suffer if the animals were allowed to be shipped in and he had to abide by the results of what is here styled the retest.

REPUBLIC

Internal Gear Drive

MOTOR TRUCKS

Save Time and Labor on the Dairy Farm



Dairy Farmers who own Republic Trucks find that hauling milk and cream to market takes less than half the time it did formerly.

Republic Trucks are a profitable investment on any farm. They are built with the extra strength and durability that insure their working for you day in and day out in any kind of weather.

The Internal Gear Drive has nothing to do but to drive the truck. It applies the power near the rim of the wheel and gets a big increase in pulling ability. The load is carried on a separate I-beam axle of solid forged steel, much lighter than any other form of construction and at the same time stronger.

This saving in unsprung weight means longer life to tires and important savings in gasoline and all other upkeep expense. 45% greater road clearance makes these trucks travel any country road easily without fear of stalling even in mud and snow.

Republic trucks have been proved efficient in every kind of hauling. Last year Republic produced and sold more than twice as many motor trucks as any other maker.

The Internal Gear Drive delivers 92% of the motor power to the wheels. We know of no other drive that delivers as much.

More than 1300 Republic Service Stations distributed all over the United States, back up Republic quality.

Seven Models—¾ ton to 5 ton.

Coming Events

Farmers' National Congress meets in Jacksonville, Florida, December 3-6, 1918. President, J. H. Kimble, Port Deposit, Md.

Wisconsin Cheesemakers' Association meets Jan. 8—10, 1919, at Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Wisconsin Dairymen's Association meets at Menomonie, December 5 and 6. Secretary, P. C. Burchard, Ft. Atkinson, Wis.

New York October Milk Price Reduced

An action has just been taken which will materially affect every dairyman in the country. The Dairymen's League price for October milk of $3.65 per hundred has been reduced by the United States Food Administration to $3.57 per hundred, and the new base price zone established by the League for October as 250 miles from New York has been changed back to 150 miles as it was before October.

At a special meeting of the League Board of Directors called at the request of Herbert Hoover, United States Food Administrator, in New York October 2nd and 3rd, the directors were read a request which was practically an ultimatum ordering them to accept the above price and conditions. There being no choice in the matter, the directors passed the following resolution:

Whereas, Herbert Hoover, Food Administrator of the United States, has requested this organization to agree to a price of $3.57 a hundred for the month of October for 3 per cent milk subject to previously existing freight and butterfat differentials, and

Whereas, he states that the acceptance of this request by producers will be a material assistance to his war efforts,

This statement is to us imperative and is interpreted as a mandate, as every personal and organization interest must be subordinate to winning the war: Therefore be it

Resolved, that we advise our members to comply with such request.

As has been previously explained, the October price was not set arbitrarily by the League but came as a result of a careful and scientific investigation of a great amount of evidence bearing on the costs of milk production. Doctor Warren of the College of Agriculture at Ithaca and several other scientists of the country have found from many surveys on the costs of production and from evidence given before milk commissions, the qualities of the different factors such as feed, hay, labor, etc. which are required to produce one hundred pounds of milk. These amounts have been assembled in a formula known in the trade as the Warren formula. To determine the price for any month by use of this formula, it is only necessary to substitute the values of each factor in the formula. This method of determining costs of production is conceded by the leading experts of the country to be the most correct and scientific method in use for finding the cost of milk.

Several conferences for the purpose of determining the price for October were held between the dealers and representatives of the League in September and at many of these conferences representatives of the Food Administration were present. The use of the formula was agreed to and an agreement was reached on all of the costs of each factor in the formula for October milk, except the price of labor. The dealers claimed that this should be under 30 cents per hour, and the league maintained that it should be at least 35 cents. Because of the disagreement on this factor and also the fact that the dealers would not agree to extending the zone to 250 miles, no agreement was reached, and as the time for putting out the October contracts was approaching, the League determined the October costs of milk by use of the Warren formula and announced the result, which was $3.65 a hundred.

After the announcement of the league price, contracts were put out and accepted by the dealers and the price was announced and posted at most stations in league territory. On September 28th, three days before the October contracts were to take effect, the Executive Committee of the League was asked by Arthur Williams, Federal Food Administrator for New York City, to rescind its contracts and reduce the price for October on the ground that milk should not be sold in New York City for more than 15 cents a quart. The Executive Committee replied to Mr. Williams that they were unable to reduce the price because it only represented the costs of production to farmers and that in any case it was too late to change prices for October because contracts were closed and prices posted. It was also pointed out to Mr. Williams, and later in a letter to Mr. Hoover, that to first determine a price that consumers should pay and from this allow the distributors their costs and profit, giving to the farmers what might be left, is a method as fallacious as it is unjust. Following the conference with Mr. Williams, a telegram was sent to Mr. Hoover by the New York City food authorities, stating that the League could not agree to modify its prices, after which Mr Hoover asked the League to call a special meeting of the Board of Directors and sent an official representative who brought a request from Mr. Hoover which was interpreted by his representative and by the League directors as an ultimatum to arbitrarily reduce the October price. Mr Hoover stated that the acceptance of his request would be of materia assistance to him in his war efforts

The League, of course, could not be in a position of refusing to follow the directions of Mr. Hoover, as it is recognized by all that every interes must be subordinate to that of winning the war.

The League believes that Mr. Hoover intends to be absolutely just, bu that he misunderstands the situation Mr. Hoover has announced that a conference will be called in the nea future to determine prices and at such conference the League hopes to be able to explain the farmer's position —THE DAIRYMEN'S LEAGUE, INC.

THE END OF A PERFECT DAY AT THE DAIRY CATTLE CONGRESS

THREE VETERAN SHOWMEN

Reading from left to right: J. R. "Happy" Allen, at present showing Shorewood Guernseys for D. D. Tenney; J. H. "Jimmy" Lee, Dean of showmen, who is showing Guernseys for W. W. Marsh; John Swanigan, who is showing Jerseys for Longview Farm. Jimmy Lee has been showing for 32 consecutive years, Happy Allen for 23, and John Swanigan for 23. With these men, showing dairy cattle is an art and it is a safe bet that they could win with an inferior animal over the layman with a better one.

New York Butter Market

NEW YORK CITY, OCT. 8—Appa ently the upper limit of butter price was reached last week. For some tim there had been an under-current feeling among butter buyers tha there must be a halt in the upwar trend of prices else butter consump tion would cease entirely. The chang came quite hurriedly. For a day two there was an unsettled feeling the market and practically no butt moved. Stocks began to accumula and holders began to feel uneasy. Wednesday of last week the brea came and the first decline in pri since the market strengthened in Se tember took place. On that day qu tations on all grades were lowered o cent. Stocks continued to accumula and a further decline of one cent o curred on Thursday. Thereafter the was a decline on each day until Tue day, it being one cent on Friday, o and a half cents on Saturday, a one and half cents on Monday. T quotation on extras at the close Monday was 57c or exactly five cen less than that for the previous Mo day.

On Monday afternoon the mark seemed to gain some strength. Th was due to several big buyers taki on considerable stock. In practica all stores butter began to move mo or less freely and it became evide that the decline was checked, tempor rily at least. Today quotations a one cent higher than those of yest day. The trade is thrown on fresh ceipts entirely as holders of accum lated stocks, which came in on t high market, refuse to dispose of th at prices that will cause large loss Unless larger stocks of fresh but are received, provided present ac mulated stocks are retained by holders, it will mean that prices w forge ahead again although it is

expected that the high prices of last week will again be reached. We may look forward to fluctuations in quotations throughout the coming months.

At the close today quotations on butter were as follows: Extras (92 score), 57½@58c; higher scoring than extras (93 score or above), 58½@59c; firsts (88 to 91 score), 55½@57c; and seconds (83 to 87 score), 53@55c. As yet unsalted butter has not recovered from its slump but it is quoted at a differential of one and one-half cents over corresponding grades of salted butter.

W. B. LIVERANCE.

Holstein Breeders of Pennsylvania to Meet

There will be a meeting of the State Holstein-Friesian Association of Pennsylvania at Hotel Sterling, Wilkes-Barre, Pa., on the evening of October 23rd. The Northwestern Pennsylvania Breeders' Association is holding a two days' consignment sale in the city at that time, and the time of the meeting has been so arranged that the breeders can attend both the sale and the meeting. No effort has been spared to make this meeting the greatest possible success.

The meeting will open by a dinner given in honor of D. D. Aitken of Flint, Michigan, president of the Holstein-Friesian Association of America, in the main dining room of Hotel Sterling, to which all breeders and persons interested in Holstein cattle are cordially invited. President Aitken stands foremost among breeders of Holstein cattle, and the breeders of Pennsylvania are glad of the honor and privilege of having him present at their meeting.

The National Holstein-Friesian Association of America will hold its next annual meeting at Philadelphia, and it will be necessary for the breeders of Pennsylvania to strengthen their state organization in order to give the National Association the royal reception that it has been accorded in other states.
